## FOREWORD

### Managing Knowledge in Uncertain Times

Welcome to the 16th edition of IFKAD. This 2021's edition is once more, unfortunately, signed by the implications of the pandemic which has transformed our lives and habits. In the last months, with the enormous effort of science that has provided vaccines in a record time, we have discovered the power and critical relevance of social and relational capital to cope with complex challenges. Thanks to the sharing and combination of Knowledge across countries' institutions, we have been able to create a collective intelligence to face the diffusion and adverse effects of Covid-19. We have seen the importance of creating mechanisms and infrastructure to support knowledge processes to drive value creation. However, the challenges ahead are still numerous. There is a need to learn from this challenging time to develop a capacity to respond effectively to current and future new problematic crises. For this reason, the IFKAD2021 is dedicated to the topic of "Managing Knowledge in Uncertain Times" to point out that the management of knowledge assets becomes paramount when dealing with growth, survival, and sustainability. Indeed, IFKAD's fundamental hypothesis is that Knowledge is the primary driver, from the viewpoint of both flow/process and stock/output, of any organisation's dynamics to prosper in a complex and turbulent environment.

Considering that many delegates cannot travel because of the coronavirus pandemic, IFKAD2021 is managed as a blended event with some sessions to be managed onsite at the University of Rome3, in Rome on the 2nd and 3rd September, and others online.

IFKAD 2021 aims to contribute to understanding the role of managing Knowledge to support organisations to navigate uncertain times. In the management literature, the acronym of VUCA highlight Volatility, Uncertainty, Complexity and Ambiguity, denoting the new reality organisations must face in their operations, and strategic decisions represent the new reality of the business landscape. Organisations have to develop the capacity to handling disruptive innovations, overlapping crises, and transformation to survive and prosper. During uncertain times, organisational business models and traditional working mechanisms are at stake. Organisations must develop strategies and implement management initiatives to respond to the waves of disruptions impacting their businesses.

Understanding the strategies, projects and tools to manage the Knowledge to navigate uncertain times is essential for the survival and sustainability of any private, public and social organisation. The capacity of creating, employing and deploying Knowledge is critical to protect the business and to guarantee that organisations can continuously contribute to the value creation dynamics of stakeholders' wealth creation.

Knowledge management is essential to drive organisations through the crisis. It can help implement change management, optimise operations, and, most importantly, support organisational learning mechanisms that can turn into innovations strengthening corporate systems of responding to a complex socio-economic landscape. The management and assessment of knowledge assets can encourage workplace protection, ensuring employees safety and engagement to find new solutions. A knowledge-based view of the employment and deployment of new technologies can support smart working, the security of employees' expertise from

dispersion, the creation of knowledge communities for innovation, the strengthening of social capital to face the psychological and sociological human tragedies. Knowledge management strategies play a central role in developing supply chains resilience and reorganise operations. The assessment and protection of intellectual capital are critical to reducing the risks of a financial downturn. Finally, knowledge-based strategies can help to maintain relationships with customers and key stakeholders.

At the 16th edition of IFKAD, we wish to extend our theories, findings and business discourses about the role and the dynamics of Knowledge in a time of a growing level of uncertainty. To discuss to what extent strategic knowledge management can support organisations to maintaining resilience, flexibility and agility for sustainable organisational value creation capacity.

With your contribution, we make IFKAD the learning space to advance our understanding of how managing knowledge organisations can face business and socio-economic challenges. The multidisciplinary field of knowledge management can provide valuable insights to help leaders and managers to think and rethink their organisations to equip them with a knowledge management capacity to absorb and react to disruptions and crises effectively.

This year's IFKAD is supported by the LUM University, Rome Tre University and the Chinese Culture University. Moreover, we have the support of SUPSI, which will be the host of IFKAD2022.

The mission of IFKAD is the development of research and scientific conversations aimed at contributing to theory-building as well as to the managerial practice about the role of Knowledge as an organisational value-driven source. Our view is that organisations are primarily in the business of Knowledge and their capacity of managing Knowledge depends on their future business sustainability and value creation capacity.

I want to extend my gratitude to all those colleagues and friends who work to make IFKAD a successful scientific event and a great social gathering where to meet old friends and make new ones. I am sure that IFKAD2021 will continue to inspire a fruitful conversation capable of nurturing our curiosity and scientific expertise. Furthermore, I am confident that all delegates will share insights that can help organisations navigate the difficult time and complex socio-economic landscape generated by the coronavirus crisis.

Prof. Giovanni Schiuma

## A Knowledge Strategy for the 'Greening' of Financial Firms

---

John B Holland

The Adam Smith Business School,  
University of Glasgow, Main Building, Glasgow, G12 8QQ,  
Scotland, UK

### Abstract

The research question of the paper is *How can financial firms go green?* Change in banks, fund managers and other financial firms is at the heart of green finance, its role in green economy changes, and rapid responses to significant risks of climate change. This involves purpose led change in complex systems in firms and comprises significant problems of understanding and action. Complexity must be addressed to manage change and problems. This requires closing knowledge gaps in practice and academy.

Field and archival research are used to reveal the main elements, connections, and interactions, in the case financial firms as complex socio-technical systems (Mitleton-Kelly (2003), and in their green change process. The focus of this empirical narrative is on change in nonfinancial aspects and how this changes financial activities.

An interdisciplinary approach (Knights and Willmott, 1997; de Bakker et al, 2019) is adopted to interpret the resulting empirical change narrative and develop an equivalent theoretical narrative. These narratives constitute a conceptual framework in the form of a Green 'Behavioural theory of the financial firm' (green BTTF).

This knowledge strategy (Zack, 1999) directly addresses issues of uncertainty and complexity by closing the knowledge gap (Holland, 2010) between, what academics and practitioners know about the greening of financial firms, and what they need to know. It is a means to close knowledge gaps in practice and academe in co-ordinated ways. This is a basis to develop integrated thinking and promote holistic actions about knowledge dynamics involving green change in the firms.

This holistic narrative approach has potential 'to make a difference' in; learning, knowledge dynamics, thinking, and believing about desirable actions and responses to climate change (Shiller, 2019; King and Kay, 2020) in financial firms and wider systems. These are part of the evolving means to realign value in financial markets with values of wider society (Carney, 2020).

**Keywords** – Financial firms, Climate, Complexity, Knowledge,

**Paper type** – Academic Research Paper

## 1 Introduction

The research question of the paper is *How can financial firms go green?* Change in banks, fund managers and other financial firms is at the heart of green finance, its role in green economy changes, and rapid responses to significant risks of climate change. The green financial firm and its positive impact on climate change is part of the means to protect and restore nature and its biodiversity, and vice versa. This involves purpose led change in complex systems in firms and comprises significant problems of understanding and action. Complexity must be addressed to manage change and problems.

This requires integrated thinking about such change and dealing with problems of knowledge and knowledge gaps. Knowledge gaps concerning financial firms are arising in the field of practice and in the field of academe due to the complexity and rapidity of climate change. This reflects history of change in this sector. The GFC revealed historic knowledge gaps in the field of practice and field of academe concerning financial firms (Turner, 2009; Holland, 2010, Gendron et al, 2013).

Climate change issues have been significant for many years, but Paris 2015 created high awareness of green dimensions to knowledge gaps. The finance only purpose of the firm is being challenged, and major green changes are being made in financial firms and their impact on GHG emissions and global warming.

Practitioners, regulators, the EU and UN, have sought to develop a body of 'knowledge of practice' to enable financial firms to respond to climate change. *This includes* Principles of Responsible Banking (2017-2019); TCFD (Bank of England, 2017); UNEP SDGs and Paris 2015 aims; Green taxonomy (EU, 2020); and GFANZ (2021). However, practitioners still face knowledge problems. It is difficult to develop a holistic view due to the rapid and complex climate change processes, and problems of explaining and managing change in financial firms as complex systems (Mathews, Net Zero Finance Conference, 2021).

A major academic knowledge gap remains. Despite the extensive criticism of finance theory post GFC (Gendron et al, 2013), there is very limited research by traditional finance academics on matters of substantive change in areas of public policy such as climate change (Diaz-Rainey et al, 2017; Hong & Scheinkman, 2020). Finance academics have yet to adapt the dominance of finance theory and financial aims to reflect changes in purpose and function in finance. Finance

theory does not reflect the major changes in finance phenomena concerning climate change, biodiversity, and corporate social responsibility in post GFC era.

The paper argues the gap for 'knowledge of practice' is partially solved by conducting field and archival research to explore empirical phenomenon on how financial firms are 'going green'. The 'academic knowledge' gap is partially solved by using relevant theory and literature sources in an interdisciplinary approach (Knights and Willmott, 1997; de Bakker et al, 2019). This is used to interpret the field based 'green' empirical insights, thus aligning knowledge changes in fields of practice and academe.

These approaches are combined in a *green oriented* 'Behavioural theory of the financial firm'. This knowledge strategy (Zack, 1999) directly addresses issues of uncertainty and complexity by closing the knowledge gap (Zack, 1999, Holland, 2010) between, what academics and practitioners know about financial firms, and what they need to know. This holistic narrative approach has potential 'to make a difference' in; learning, researching, thinking, and believing about desirable responses to climate change (Shiller, 2019; King and Kay, 2020).

Section 2 on research methods outlines sources of data and use of qualitative methods to understand green oriented change in financial firms. Section 3 presents a conceptual framework or 'green behavioural theory of the financial firm' (Green BTFF) as integrated empirical and theoretical narratives. Section 4 outlines the conclusions and explores how the approach in the paper has potential 'to make a difference' when facing complexity and uncertainty arising from climate change.

## **2 Research methods**

The paper uses qualitative research and theoretical interpretation to explain how financial firms can go green. In this research, "field-based stories" or "empirical narratives" (Golden-Biddle and Locke, 2007) are based on empirical findings about financial firms as they changed for sustainability reasons. Two sources of data are used. *Firstly*, public sources are used to develop detailed cases of change in six major financial firms in the period 2010-2021. These include three banks (NatWest/RBS, Lloyds, Wells Fargo), and three fund managers (Schroders, Baillie Gifford, Blackrock). *Secondly*, the author attended eleven major practitioner conferences to gauge change across many financial firms. The practitioner conferences are at the heart of the practitioner and policy debate about change

in green finance. They included Green Finance Summits (2017 to 2021); Ethical Finance Summits, (2018 to 2021), and many others. The data was based on firms committed to sustainability and Net Zero aims (GFANZ, 2021). Presentation of the paper at academic conferences provided many ideas from the academic community. The change narrative covers periods of rapid change, and major problems and crisis from 2010 to 2021 with an emphasis on climate change. Covid-19 pandemic (2020-21) was a novel source of insights. Data processing sought to identify core empirical themes and their connections in wider patterns. This was the basis to develop an 'empirical narrative' (Golden-Biddle et al, (2007) revealing links between common themes identified for financial firms, and stakeholders. The themes concerned; changes in structure, mechanisms, process and interactions, internal working conditions, behaviour, decisions, communication and reporting actions and outcomes; as well as consequences and feedback. The 'empirical narrative' was interpreted using relevant literature to develop an equivalent 'theoretical narrative' and form a 'green behavioural theory of the financial firm' (Green BTFF).

### **3 A Green Behavioural theory of the financial firm (Green BTFF)**

This section shows how the Green BTFF is based on a combination of insights from an "empirical narrative" interpreted within a "theoretical narrative" (Golden-Biddle and Locke, 2007). The narratives reveal the mutual, reciprocal nature of organisational dynamics: between contextual resources (structure and knowledge, control mechanisms, technology), interactions and conditions, and decisions; during change dynamics and operational activities. Financial firms are seeking a subtle combination of, *'What we are (becoming) and what we are for, affects what gets done'* and *'What gets measured gets done'*.

#### **3.1 Financial firms as complex systems**

The empirical evidence in the cases shows that financial firms and their stakeholder networks, operating in financial markets and changing environment, form complex systems made up of core elements and connections, purpose, and dynamic processes (Mumford, 2000; Mitleton-Kelly, 2003; Barile et al, 2018; Holland J. H, 2014). In broad metaphor terms (Morgan, 1997) the financial firm socio-technical system consists of 'Head', 'House', 'Community', and 'Machine' elements. The core elements concern: top teams and purpose ('head'); contextual

resources ('house'); interactions and conditions (in 'community' of employees and others); and a financial 'machine' of connected financial decisions. The clusters of factors form the relatively invisible system which influence how people 'live' and operate in top teams and other teams in financial firms. Dynamics involve many purposeful and multidimensional interactions between employees and with stakeholders. These arise at the top, in the 'house' and in 'communities' (internal, external). The mutual reciprocal interactions involve shared thinking and actions in the firm and external networks. The emphasis is on 'doing the right thing' defined by an explicit green oriented and socially responsible purpose.

These interacting socio-technical resource elements and financial resources are integrated in purposeful ways in **business models**. Firms seek to integrate areas such as green purpose, with changes in firm wide areas such as culture, technology, and control systems, as the basis for success. This integrated system of non-financial and financial resources is the basis for transforming the inputs, through business activities, into outputs and outcomes in a 'financial machine' that aims to fulfil the organization's strategic purposes (IIRC, 2013).

### **3.2 The change narrative**

The above aspects of the complex system are the focus of change dynamics outlined in the cases. Changes in one part of the system such as organisation structure or product design will have an impact on other parts such as culture or customer relations. The financial firm is an open system responding to many change pressures (Holland, 2019). These systems have emergence properties whereby the action of the whole is greater than the sum of the actions of parts (Holland J. H, 2014). As Mitleton-Kelly (2003) argues, change and the evolutionary process moves all the time between micro behaviours and emergent structures and mechanisms, each influencing and recreating each other

Thus, the whole system and its changes must be viewed together during change processes to increase the chances of success. Integrated thinking skills, avoidance of silos, and shared understandings at all levels, are required to align everyone in the firm whole system to pursue desired outcomes. These changes must have strong anticipatory and environmental scanning elements based on quantified scenario analyses and qualitative 'envisionment' perspectives (Mikes, 2012) of future risks. The latter include connected climate change risks, biodiversity, social, and financial risks for long term (2050), medium term (2030)

and short-term horizons (say from one year to 2025 ahead). They include scenario analysis for physical and transition risks and how they can interact and lead to 'tipping points'.

The following subsections includes succinct summaries of insights from four major parts of the integrated 'empirical change narrative'. Each part of the empirical change narrative is supported by a brief theoretical interpretation.

### **3.3 Changes in strategic thinking and top teams (the 'head')**

*The first part of the strategic 'change narrative' starts with change pressures and learning at board and executive team levels. Case firms such as NatWest and Schroders and members of specialist financial sector (Net Zero) alliances (GFANZ, 2021) are making changes to firm purpose, function, and planning. They are changing leadership, and composition and governance of board and executive teams, to create the capabilities to deal with climate change risks. This leads to strategic choices about the green purpose and orientation of the firm, and to performance metrics about Net Zero outcomes. The above changes in top teams - drive co-ordinated changes to contexts, mechanisms, and technology - throughout the financial firm - to achieve sustainability and financial aims.*

*The theory and literature view of the above views case financial firms as a 'learning organisations' (Pedler et al., 1997). This explains how top teams learn how to make strategic choices about new enabling infrastructure and enabling conditions with new sustainable advantages and resilient dynamic capabilities in their firms as complex systems. Top teams "look in" at organisation and knowledge, and "look out" and learn about markets and stakeholders (Pedler et al., 1997). They use learning to think about creating resilience and dynamic capabilities (Teece, 1997) in contextual resources, interactions, conditions, and decisions.*

### **3.4 Changing context as adapted infrastructure and mechanisms**

*The second part of the strategic empirical 'change narrative' explains how firms make green oriented changes in; 'enabling infrastructure' or 'soft' 'socio-technical' contexts (Mumford, 2000; Mitleton-Kelly, 2003) in the existing financial firm 'house' and 'community'. Climate change leads to **three** major clusters of strategic change to firm socio-technical infrastructure. The first cluster includes*

changes to: firm wide social structure, culture as 'organising' means, and to knowledge resources; at both macro and micro levels. The second cluster concerns green changes to control and influence mechanisms. These include communications and storytelling, top team behaviour, training, incentives ('soft' and 'hard' ), formal control systems, as well as changes in culture as a means of controlling and influencing. 'Culture' is used in cases to connect ideas of social organisation and social means of control and influence. The third cluster involves green changes to technology and impact on knowledge and social process.

The *theoretical analysis* of the above discusses how the case firms use their top team learning and planning capability to promote green organisational change in the socio-technical infrastructure in the three clusters throughout the firm. This uses *organisational* literature and theory sources such as Burnes, (2004); Lewin, (1947); Cyert and March, (1963). Schein's (2004) ideas of culture as an important learnt and evolved property of organisation life, plays a role in explaining behaviour and change. From a *system theory* perspective, the firms develop a green orientation to their 'Socio-cultural and technical' elements (Mitleton-Kelly (2003) or soft', technology, and measurement parts of the firm complex system.

Green knowledge resources concern knowledge of climate change risks, social organisation, green finance, and design of new green products. They form intellectual capital (Meritum, 2002) or human, structural, and relational capital. The green oriented influence and control mechanisms form additional ways of organising and integrating firms and enabling behaviour and actions (Gond et al, 2012) . New technology is a key factor in creating new socio-technical systems and conditions (Mumford, 2000). These changes to the socio-technical infrastructure create economic advantages in behaviour and information production. They lead to green changes in transforming risk, return and liquidity of financial resources (financial intermediation) (Buckle, et al 2011; Holland, 2019) and in delivery of financial services.

Thus, all non-financial and financial parts of this complex system are the focus of change. The above analysis explains how the full set of integrated and green oriented socio-technical infrastructure factors embed green change (Lueg & Radlach, 2016) in financial firms. These integrated social and knowledge factors, influence and control mechanisms, and technology, are means to prevent the dominance of financial values and avoid the 'tragedy of the horizon' (Carney, 2015). They are means for financial firms to create incentives for their employees and their customers to place a value on the climate and nature and to act to

protect these (Dasgupta, 2021). They are systematic and connected means for financial firms to control 'crowding out' pro-social behaviour (Bénabou, Tirole, 2006) at a time when a new perspective is required. They are means to promote 'sustainability orientation' and environmental pro-activity (Ditillo & Lia, 2016) in financial firms, their employees, and customers. For example, combining environmental consciousness from green oriented 'soft' context and mechanisms to 'hard' financial incentives such as pay, is critical to changing behaviour of managers and employees to pursue sustainability aims (Narayanan et al, 2021) in their financial decisions.

### ***3.5 Using 'people' interactions –to mobilise mechanism within context – to influence conditions***

*The third part* of the strategic empirical 'change narrative' concerns core dynamics in the change process involving many connected factors and process.

The narrative explains how these resources are mobilised, how changes are enabled and driven by organisation processes (Cyert and March, 1963) as purposeful interactions at individual, team, firm, and network levels. The interactions concern top-down processes such as setting a green 'tone from the top', and promoting green oriented culture (Schein, 1989). They involve individual and teams (and their social and knowledge characteristics) interacting with each other in multidimensional ways (through bottom up, lateral, and network interactions), within green oriented organisational structure and network contexts.

The multidimensional social interactions are the primary means to mobilise the socio technical infrastructure and firm wide controlling and influencing mechanisms, to create desirable or green oriented working conditions. These include emotional enabling conditions such as trust, desire to co-operate, sense of ease of communications, shared sense of purpose, and buy-in to the change narrative. The narrative shows how the case firms create desirable decision and working conditions based on; understanding of climate change risk, the ability to create green information about fund users and suppliers, and to control their own behaviour relative to sustainability and financial aims. The change to working conditions are made to improve each decision team's focus on risk and opportunities relative to Net Zero (GFANZ, 2021) and financial aims. They are

used to change economic advantage and behaviour, and create information for financial decisions.

Thus, new socio-technical structure and organisational process *shape* changes in decision behaviour in teams. Purpose led mechanisms (for control and influence) and purpose led 'people' interactions (multidimensional) *drive* the financial firm 'community'. Collectively, they influence 'ongoing engagement' with employees, customers, and stakeholders, as well as the delivery of new green products.

The *theoretical analysis* of the above uses literature to interpret the mutual reciprocal interactions and co-evolution (Mitleton-Kelly, 2003) in the dynamic system. A select group of significant sources are chosen including Bourdieu, (1990), Schein (1989), Weick, (1995), Boyce, (1996), Statman, (1999), Stones (2005). These explore **how** multidimensional social interactions by employees (top down, bottom up, lateral, and network) within the new green socio-technical infrastructure, are used to mobilise influence and control mechanisms. They are used to exploit change in these social and knowledge structures and mechanisms, and shape and drive new behaviours. The changes and interactions influence interpretation of external events and stimuli, to guide behaviour and decision action. These mutual reciprocal interactions during everyday activities play a role sustaining social and knowledge structures (Bourdieu, 1990; Stones, 2005), and in stimulating further change and evolution over time.

### **3.6 *Changing economic conditions and financial decisions in a financial 'machine'***

The *fourth part* of the strategic empirical 'change narrative' highlights how changes to the non-financial context and working conditions, supports new economic conditions and ways to deliver new financial decision activities and products. The latter concern creation of new green oriented financial assets and liabilities (and derivatives of) in each firm's specialist domain. The new working conditions improve each decision team's focus on risk and opportunities relative to Net zero and financial aims. They change the way financial resources are used in operational activities and financial decisions. They change financial decisions to save, lend, invest, or insure to reduce harm of GHG emissions. They are means to deliver green financial services and functions required by customers, employees,

shareholders, citizens, and other stakeholders in their pursuit of Net Zero outcomes.

The *theoretical analysis* of the above makes use of theory of the firm (Barney, 1991; Hart, 1995; Teece, 1997) and theory of finance (financial intermediation) (Scholtens and van Wensveen, 2003; Holland, 2019).

The existential threat of climate change and regulatory pressures means that top teams seek to create co-operative advantages with their sector peers in other financial firms (GFANZ, 2021) and with client firms in the real economy. In this co-operative context they pursue sustainable co-operative and competitive advantages to create superior financial performance that supports shared climate change aims. Thus, **the resource-based view of the firm** (Barney, 1991; Hart, 1995; Teece, 1997) reflects both co-operation and competition.

Literature from the 'Behavioural finance' perspective (Statman, 1999) indicates that the case financial firms seek to use their new green context, process, and capabilities to reduce behavioural biases in firm employees when making decisions. They can exercise control over behavioural biases in others that lead to increased GHG emissions.

**Theory of finance**, especially financial intermediation, (Scholtens and van Wensveen, 2003) are used to explore how the changes to; 'soft' infrastructure, co-operative behaviour, and competitive advantages; are means reduce major information asymmetries (Holland, 2019). This creates opportunities to source and allocate green funds and make green oriented changes to the provision of 'hard' financial products and financial functions. The 'socio-technical' elements, and co-operative advantages in the firm are necessary means to mobilise use of financial resources in conventional financial intermediation in pursuit of sustainability aims (Holland, 2019).

## 4 Conclusions

The aim of the paper has been to answer the research question *How can financial firms go green?* This involved change in complex systems. It was explored through empirical narratives and theory narratives (Golden-Biddle and Locke, 2007). These formed a conceptual framework as a Green 'Behavioural theory of the financial firm' (green BTTF).

The green BTTF directly addresses issues of uncertainty and complexity. It is part of a knowledge risk management strategy (Zack, 1999; La Torre, 2020) to

understand the complex system and respond to uncertainty (Bratianu, 2020). It is a means to close the **knowledge gap** (Holland, 2010) in both in practice and academe, between, what the firm and others know, and what they need to know (Zack, 1999), when making decisions during rapid change with potential for severe crisis. This is a basis to develop integrated thinking and promote holistic change and actions.

This reduction of knowledge risks (La Torre, 2020) goes beyond conventional knowledge risks concerning financial intermediation, and regulation of financial risks (Holland, 2010); to risks with knowledge of non-financial aspects of firms. This complements financial intermediation theory (Buckle et al, 2011; Holland, 2019) by explaining the role of intangibles in transformation of financial capital and risks and delivering specialist financial functions in economies.

The green BTTF has many potential uses 'to make a difference' in **learning, thinking, and actions**, by financial firms, and by co-operating and competing agents in the finance system and wider society. Agents include 'top teams', the rest of financial firm, advisory policy bodies, legislators, and regulators. They include civil society organisations (CSOs), customers, employees, citizens, and academics. The changes are means to realign value in financial markets with values of wider society (Carney, 2020). They are ways to align financial firms; their suppliers and users of funds (companies and customers); with net zero aims.

Such integrated thinking offers many potential ways 'to make a difference' in **actions** in financial firms, finance system and wider society. In **firms**, the green BTFF is used to argue that firms must clarify the key components, connections, and dynamics in these changes. It is used to argue that significant co-ordinated changes are required in 'deep' or hidden aspects of financial firms and in their specialist roles, to make them 'green oriented' and responsive to the problems. In **markets and society**, the green BTFF provides a shared means for advocates of differing change mechanisms such as *voluntary co-operation, mandatory law, competition, and the 'invisible hand' of markets*, to think how to collectively use them to transform financial firms to go green.

The green BTFF as part of an extended knowledge risk management strategy involving many wider system agents. In Shiller's (2019) terms, it has the potential to limit contagion of uniformed or oversimplified ideas about climate change and the response of financial firms. This reflects Shiller's (2019) call for 'narrative economics' which has the potential to improve the collective ability (in markets, and wider society) to predict, prepare for, and lessen the damage of climate

change as well as financial crises, recessions, depressions, and other major economic events. This reflects King and Kay's (2020) argument that in the face of uncertainty decision makers should rely more on robust and resilient reference narratives, in which uncertainty is embraced as a source of creativity and benefit.

### Abstract

The aim of this work is to carry out a mapping of existing literature on "Intellectual Capital (IC)" and "Performance" and relationships between them with a focus on knowledge organizations, including universities, but not limited to them. We propose an *enriched*

systematic review approach, in order to analyze what we know about the relationships between IC and the performance of knowledge organizations and which indicators have been proposed and are adopted by knowledge organizations to assess their performance.

**Keywords** – Intellectual Capital, Performance, Knowledge Organizations, Multidimensional Assessment, Meta-choice Problems

**Paper type** – Academic Research Paper

## 1 Introduction and contribution of the paper

Knowledge, and in particular Intellectual Capital (IC), represents the main wealth of organizations, especially in turbulent times such as the current ones. Due to the relevance of the topic there has been a rich interest and scientific production on the topic recently collected in several surveys, including Petty and Guthrie (2000), Serenko and Bontis (2017), Dumay et al. (2015) and Garanina et al. (2021).

On the other hand, measuring the contribution of knowledge to the overall performance of knowledge organizations is anything but simple and straightforward. Some authoritative scholars already raised specific challenging issues like the assessment of the productivity of knowledge workers and the sustainability of knowledge strategies (Drucker, 1999). The performance of knowledge organizations has a multidimensional nature and requires a benchmarking based on multiple Key Performance Indicators (KPIs). In addition, the assessment of performance of knowledge organizations is related not only to the IC in its three dimensions of *Human Capital*, *Structural Capital* and *Relational Capital*, but also to other financial and non-financial dimensions. On top of this, as we have shown in Daraio et al. (2020), performance evaluation, including knowledge and IC, is affected by the so-called three-dimensional *meta-choice problem*. This problem refers to i) the conceptual dimension of the performance evaluation model (underlying *theory*); ii) the *methodologies* of analysis that are applied and to iii) the *data* used to calculate the indicators of reference.

The aim of this work is to carry out a mapping of existing information and relationships between “Intellectual Capital” and “Performance” with a focus on knowledge organizations, including universities, but not limited to them. To answer the question “What do we know about the relationships between IC and the performance of knowledge organizations” and “which indicators have been

proposed and are adopted by knowledge organizations to assess their performance, including IC", we propose an *enriched* systematic review approach.

Our aim is:

- (i) provide an updated and complete mapping of IC and performance,
- (ii) identifying a rich set of indicators which integrate the existing literature both published in international peer-reviewed papers and in the *grey literature*, e.g. practical-based reports, produced within knowledge-intensive firms.

## 2 Methodology

We follow the PRISMA statement for systematic review (Moher et al. 2009), a standardized approach for documenting the survey and allowing its replicability in its current version (Page et al. 2020). Nevertheless, considering the topic of our investigation, a typical managerial and complex issue, namely investigating the relationships between IC and performance of knowledge organizations, we appropriately adapt the PRISMA methodology to the typical characteristics of the topic of our analysis, following Tranfield et al. (2003) and Petticrew and Roberts (2006). Tranfield et al. (2003) showed the usefulness of systematic literature reviews in the management area to develop evidence-informed decision support systems. Petticrew and Roberts (2006) illustrate the specificities of systematic reviews applied in the social sciences including management.

For the analysis, the Bibliometrix R package (Aria and Cuccurullo, 2017) and VOSviewer (Van Eck and Waltman, 2017) softwares will be used for mapping the existing knowledge on IC, its components and performance dimensions, and investigate the existing links among them. Existing knowledge will be mapped considering the main contributors and the evolution of the cognitive maps over time. A detailed grid will be developed to collect and empirically investigate the existing knowledge according to the three dimensional framework introduced in Daraio et al. (2020), based on theory, methodology and data dimensions.

Our survey is "enriched" because, differently from many existing reviews, we consider not only published papers in refereed journals but also the rich *grey literature* produced by knowledge-intensive firms on intangible assets and their measurement, not indexed in existing databases (e.g. Sveiby, 1996 and 2002; Brembo, 2007; Leoni, 2018).

### 3 Intellectual capital and performance: Systematic review

To perform a systematic survey, we follow the PRISMA model (Moher et al. 2009). As a first step in the PRISMA model, the eligibility criteria for the papers to be analyzed were identified. In our case, all Journal articles, conference proceedings and book's chapter written in English were considered.

In a second step, we selected the information sources, namely SCOPUS (<https://www.scopus.com/>) and Web of Science (<https://www.webofknowledge.com/>).

In a third step, we identified the search strategy through the PICO model (Shea et al. 2007). This model allows us to select the search strategy, and to construct the queries to be executed in the selected databases, see Table I.

Table I. PICO (Adapted) Model for systematic review Search.

	Population	Intervention	Comparison	Outcome

AND TITLE-ABS-KEY ( ( perform* ) OR ( productiv* ) OR ( efficienc* ) OR ( technical AND efficienc* ) OR ( inefficienc* )
OR ( rank* ) OR ( multicrit* ) ) )
AND ( LIMIT-TO ( LANGUAGE , "English" ) )

After performing the searches and collecting the results derived from the queries (specifically, the results were downloaded in .bib format) we obtained:

321 records in Scopus

256 records Web of Science.

In the next step, we proceeded to merge the results derived from the search in Scopus and WOS. The merging of these papers was performed using the Zotero software (Amhed et al. 2011), which also allowed us an initial elimination of duplicate records.

After obtaining the dataset of merged results, we proceeded to the screening of titles and abstracts of the papers through the Rayyann platform (Ouzzani et al. 2016) and Mendeley Desktop Software (Reoswog 2010), which in addition to the support of the screening phase, allowed us to eliminate additional duplicate papers not identified in the previous steps.

The number of duplicate papers identified by the various software is 144.

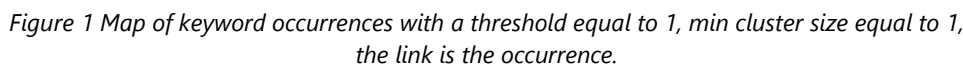

From the screening of abstracts and titles, the obtained results are:

Papers of interest to the work: 119 records

Papers not of interest for the work: 270 records, they were discarded.

In 270 cases identified, the word "university" was present in the abstracts as it identified the university to which the authors belonged, but it was not a keyword related to the content discussed in the paper. Hence, these cases were excluded.

The first analysis relates the co-occurrences of the keywords of the selected papers using VosViewer software.

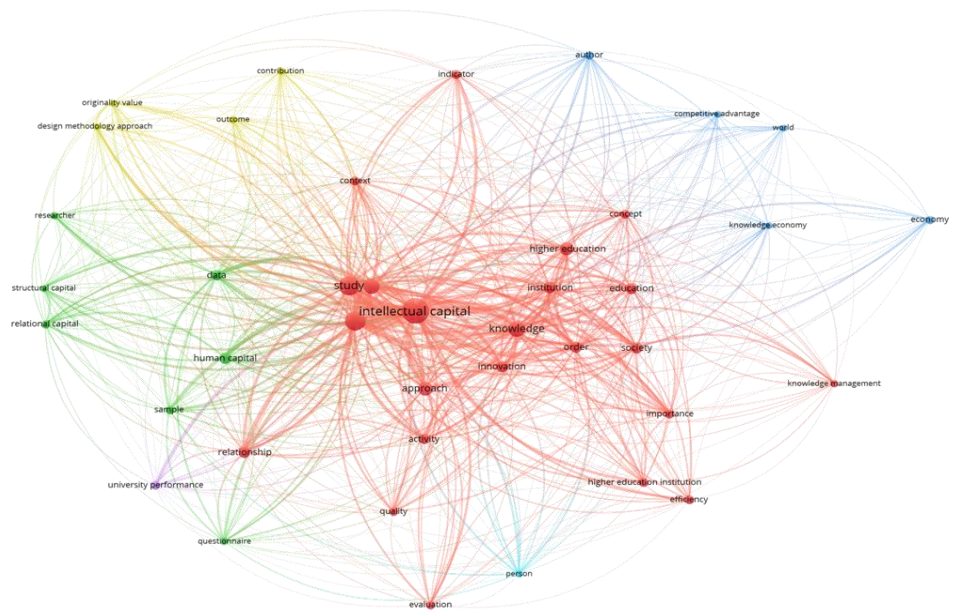

32

cluster models). In conclusion, it can be seen that in many works intellectual capital is analyzed according to the structural-human-relational capital approach.

The second analysis relates to the text mining of the keywords and abstract of the selected papers using VosViewer software through which co-occurrence maps can be created.

The text mining analysis highlights 4 main clusters (coloured red, blue, yellow, and green). These clusters identify groups of words that are often used together and can be traced back to concepts such as:

- Red cluster: words that identify the main themes addressed by the papers (intellectual capital, HEI, etc...)
- Green cluster: in-depth themes about the approach and data used
- Blue cluster: themes related to the link between intellectual capital and the knowledge economy
- Yellow cluster: words related to the contribution of the work in the scientific landscape

*Figure 2 Map of co-occurrences using text mining techniques. the first 50 values appearing 8 times are shown. the threshold is 1. The minimal cluster size is equal to 1. The link is the occurrence.*

The third and final analysis is to map the co-words using dimensional reduction techniques. This type of analysis allows mapping the conceptual structure of a

network using the co-occurrences of words in a bibliographic correlation (in our case the author keyword). The analysis was performed by adopting the Multiple Correspondence Analysis (MCA, Abdi et al. 2007) dimensionality reduction technique. This technique is used for nominal categorical data and is used to detect and represent the underlying structures in a dataset. This analysis was performed with the R package bibliometrix.

The results obtained are reported in Figure 3. In Figure 3 we clearly see that the keywords of the papers selected in our review can be distinguished into 3 main groups which can be related to the three-dimensional meta choice framework based on theory, methodology and data dimensions.

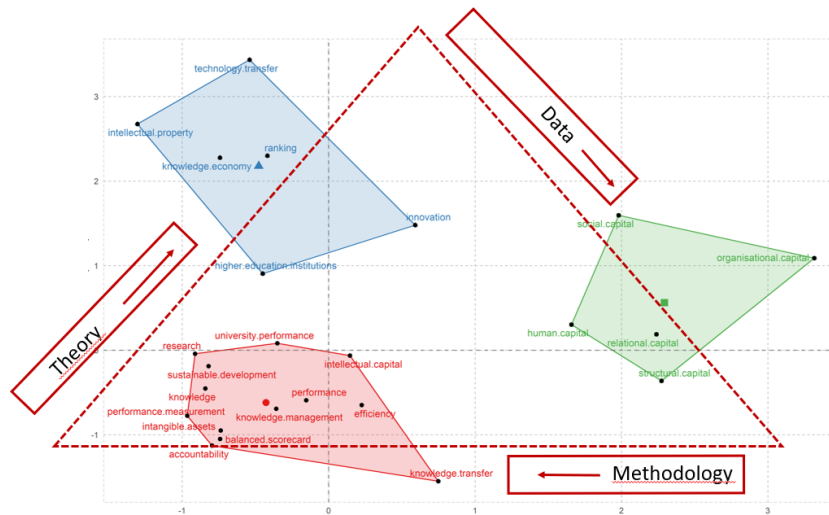

Figure 3 Conceptual Map. MCA (Multiple Correspondence Analysis) results and relationship to the 3 meta choice dimensions of Theory, Methodology and Data.. Number of terms considered 24, Number of clusters obtained is 3.

#### 4 Grey literature on Intellectual capital and performance

In order to “enrich” the systematic survey described in the previous section, we consider the rich *grey literature* produced about knowledge-intensive firms on intangible assets and their measurement, not indexed in existing databases.

Over the years, intangible assets have assumed considerable importance for companies; therefore the academic research collaborated to identify different methodologies to measure them. There are several methods to measure the value of intangible assets (Edvinsson & Malone, 1997; Roos et al., 1998; Sveiby, 1997;

Kaplan & Norton, 1992); the literature offers some classifications of the most used methodologies (Sveiby, 2001). Sveiby (2001 and 2010) provides an overview about the main methods for measuring intangible assets. In particular, starting from the classifications suggested by Luthy (1998), Sveiby (2001) proposes four categories of measurement approaches each of which has advantages and disadvantages:

- **Direct Intellectual Capital methods (DIC):** Estimate the \$-value of intangible assets by identifying its various components. Once these components are identified, they can be directly evaluated, either individually or as an aggregated coefficient.
- **Market Capitalization Methods (MCM):** Calculate the difference between a company's market capitalization and its stockholders' equity as the value of its intellectual capital or intangible assets.
- **Return on Assets methods (ROA):** Average pre-tax earnings of a company for a period of time are divided by the average tangible assets of the company. The result is a company ROA that is then compared with its industry average. The difference is multiplied by the company's average tangible assets to calculate an average annual earning from the Intangibles. Dividing the above-average earnings by the company's average cost of capital or an interest rate, one can derive an estimate of the value of its intangible assets or intellectual capital.
- **Scorecard Methods (SC):** The various components of intangible assets or intellectual capital are identified, and indicators and indices are generated and reported in scorecards or as graphs. SC methods are similar to DIC methods, except that no estimate is made of the \$- value of the Intangible assets. A composite index may or may not be produced.

The set of methodologies is summarized in the following Figure 4.

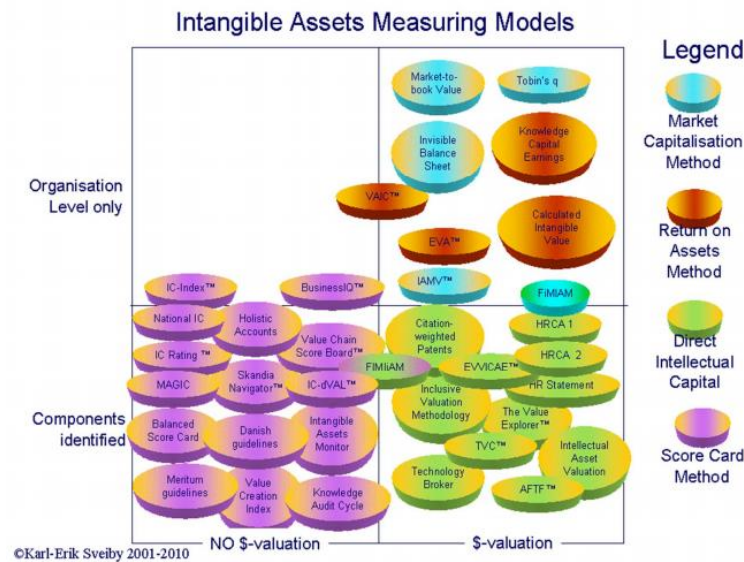

Figure 4. Intangible Assets Measuring Models. Source: Sveiby (2001).

Beyond the methods that each company chooses to adopt to measure intangible assets, the company's goal is to create an *Intellectual Capital Report*. The intellectual capital report is a tool for measuring intellectual capital, useful for internal management and company knowledge management. In practice, this report takes the form of the identification of a series of indicators, not necessarily financial ones.

In line with the purpose of the article, a sample of knowledge-based companies that have presented the intellectual capital report over the years was analyzed and the most recurrent indicators were identified. See Tables 1A and 2A, which summarize the available information, reported in the Appendix.

Anyway, the research highlighted the emerging need of companies to include, in addition to the three known components of intellectual capital, also an aspect related to the environment and the social impact of companies. This has shifted the focus from the intellectual capital report to the *Sustainability Report*; so corporate sustainability reporting is now a mainstream business practice (Ernst & Young, 2014; KPMG, 2013; PricewaterhouseCoopers, 2014, 2018). The sustainability report is a tool to inform investors and other stakeholders about sustainability activity of the company. Companies retain significant flexibility to disclose relevant information in the way that they consider most useful; In this respect, a variety of frameworks can be applied (e.g. European Commission, 2009;

ISO 26000, 2010; United Nations, 2011; OECD, 2018; COP, 2019), however, corporate reports based on GRI-Global Report Initiative (GRI, 2015) represent the main framework applied by organisations to communicate clear standardised information related to their environmental, social and economic performance to all their stakeholders.

But the following two questions arise:

- (i) what is the relationship between the sustainability report and the intellectual capital report?
- (ii) what is the relationship with company performance?

To answer the first question, we analyse the sustainability reports of a sample of knowledge-based companies and the indicators used there. In particular, we used the database "United Nations Global Compact" (available at <https://www.unglobalcompact.org/>) and we considered only companies about sector "Support Service", "Software & Computer Services" and "Financial Service".

The comparison of the indicators shows that the elements of greatest convergence are found in human capital. For instance, Lim et al. (2010) analysed the importance given to 15 human capital indicators in the investment decision-making processes of fund managers; Cinquini et. al (2012) analysed a sample of sustainability report and they found nine of these indicators, and specifically "staff satisfaction index", "ratio of value added per employee", "number of percentage of full-time", "part-time, contract or temporary staff ", "quarterly, half-year and yearly staff turnover", "average years of experience", "average age of management and operational staff", "average years of service with the company", "average educational level of workforce at each functional level" and finally "workforce competency profile".

After all, there are also some aspects related to structural capital, such as the enhancement of investments in R&D or the development of new products. The analysis of intellectual capital facilitates the measurement of the company's social relations; Therefore, we find some points in common with relational capital, such as customer growth and, somehow, the brand image and reputation of the company. Cinquini et. al (2012) offer a list of intellectual capital items on sustainability report, summarized below.

Table 1. List of intellectual capital items on sustainability report. Source: Cinquini et al. (2012, p.543)

<b>Human Capital</b>	<b>Structural capital</b>	<b>Relational capital</b>
Employees characteristics	Intellectual property	Distribution channels
Employees training	Information systems	Business collaborations
Employees skills	Corporate culture and management philosophy	University and research centre collaborations
Employees wellness	Management processes	Company reputation
	Research and development	Customers
		Suppliers
		Financial relations

In our study we have identified the indicators most used by knowledge-based companies, organized according to the three elements of intellectual capital.

**Human capital**

*Training and education:*

Average hours of training per year per employee  
Program for upgrading employee skills and transition assistance programs  
Percentage of employees receiving regular performance

*Diversity and equal opportunity:*

Diversity of governance bodies and employees  
Ratio of basic salary and remuneration of women to men

*Non- discrimination:*

Incidents of discrimination and corrective actions taken

*Human rights assessment:*

Operations that have been subject to human rights reviews or impact assessments  
Employee training on human rights policies or procedures  
Significant investment agreements and contracts that include human rights clauses or that underwent human rights screening

*Employment:*

New employee hires and employee turnover  
Benefits provided to full-time employees that are not provided to temporary or part-time employees  
Parental leave

*Occupational health and safety:*

Occupational health and safety management system  
Hazard identification, risk assessment, and incident investigation  
Occupational health services  
Worker participation, consultation, and communication on occupational health and safety  
Worker training on occupational health and safety

	Promotion of worker health Prevention and mitigation of occupational health and safety impacts directly linked by business relationships Workers covered by an occupational health and safety management system Work-related injuries Work-related ill health
<b>Structural Capital</b>	Purchase of intangible assets and property, plant, and equipment Software licence Software support Research and development
<b>Relational capital</b>	<i>Customer privacy:</i> Substantiated complaints concerning breaches of customer privacy and losses of customer data <i>Socio-economic compliance:</i> Non-compliance with laws and regulations in the social and economic area <i>Market presence:</i> Ratios of standard entry level wage by gender compared to local minimum wage Proportion of senior management hired from the local community <i>Procurement practices:</i> Proportion of spending on local suppliers

Let's now answer the second question. The sustainability report is composed by three dimensions: social, environmental and economic. Obviously, the economic component is the one that most involves the aspects of company performance. Both human capital information and human capital investment decisions are linked to firm performance, reputation and information asymmetry (Wyatt and Frick, 2010) and firms should therefore communicate this kind of information to increase their transparency (Cormier et al., 2009).

Some studies found that intellectual capital plays a critical role between corporate social responsibility and financial performance. In particular, Nikolaou (2019) explains the relationship of corporate environmental and financial performance highlighting the significance of some mediators such as social and environmental responsibility, intellectual capital, innovation and competitive advantage. Trevlopoulos et al. (2021) identified a positive link between intellectual

capital and corporate financial performance. Some performance indicators, found in the sample analyzed, are listed below.

---

***Economic performance***

---

*Economic:*

- Direct economic value generated and distributed
  - Defined benefit plan obligations and other retirement plans
  - Financial assistance received from government
  - Ratios of standard entry level wage by gender compared to local minimum wage
  - Proportion of senior management hired from the local community
  - Financial implications and other risks and opportunities due to climate change
- 

**5 Discussion and conclusion**

In this paper we have carried out a mapping of existing information on the relationships between “Intellectual Capital” and “Performance” considering in particular knowledge organizations. The questions we addressed relate to the investigation on (i) the relationship existing between “Intellectual Capital” and “Performance” and to (ii) identify the indicators proposed and are adopted by knowledge organizations to assess their performance, including IC. From the mapping exercise we have found that the relationship between intellectual capital and performance can be enclosed within the three dimensional *meta-choice* framework which refers to i) the conceptual dimension of the performance evaluation model (underlying *theory*); ii) the *methodologies* of analysis that are applied and to iii) the *data* used to calculate the indicators of reference.

It appears from our analysis that the performance of knowledge organizations has a multidimensional nature and requires a benchmarking based on multiple dimensions and indicators. In addition, the assessment of performance of knowledge organizations is related not only to the IC in its three dimensions of *Human Capital*, *Structural Capital* and *Relational Capital*, but also to other financial and non-financial dimensions including *sustainability* dimensions.

Companies have shifted their focus from the intellectual capital report to the sustainability report, with the aim of also including environmental and social aspects. Our study investigated the presence of intellectual capital in sustainability reports, in order to offer a set of indicators useful for measuring it.

In the future development of this research, we will provide an accurate screening and a content analysis on the selected full papers identified in the

systematic review to collect the different indicators adopted in this “official” literature. The resulting indicators will be integrated with the rich set of indicators identified in the grey literature summarized in the paper with the aim of offering a complete and updated set of indicators to managers and policy makers interested in monitoring the connection of Intellectual Capital and Performance of Knowledge Organizations and their evolution over time.

# Performance Improvement in the Business of Knowledge Production: a Natural Experiment from Higher Education

---

Biagio Ciao

Department of Business and Law  
University of Milano-Bicocca  
Via R. Bicocca degli Arcimboldi, 8  
20126 – Milano - Italy

## Abstract

A natural experiment from a university's teaching context shows that the internet diffusion of the class valuations from the students increases the teachers' performance. Internet allows a high level of transparency. Organizations can leverage the diffusion power of internet to increase the performance. A very high level of transparency as the one guaranteed by the publication on internet restrains the Agency Theory's moral hazard.

**Keywords** – Moral hazard, agency theory, strategy execution, natural experiment, higher education

**Paper type** – Academic Research Paper

## 1 Introduction

'In 1966, Roethlisberger and William Dickson published *Counseling in an Organization*, which revisited lessons gained from the experiments. Roethlisberger described "the Hawthorne effect" as the phenomenon in which subjects in behavioral studies change their performance in response to being observed' (Zaleznik, 1984). The possibility of people observation has been increased in the last decades terrifically. Today behaviors and their outputs can be showed to all the public through internet. Then, what does it happen when organizations share people job performance with everyone by internet? Is the Hawthorne effect valid in the modern context of the internet diffusion of people behaviors?

## 2 Theoretical Background

According to the Dalton et al.'s (2007) review an important root of the Agency Theory is the Smith's work. The prominent author was concerned about the efforts which agents would have put in managing companies owned by principals. These efforts could not be the same of the owners. Dalton et al. (2007) of course acknowledge the work from Berle and Means and mention the central point of their agency approach: the rise of the public companies owned by many shareholders with a small quote of the capital and the targets divergence between shareholders and management. Eisenhardt (1989) recalls the name of this interest divergence: moral hazard. The author also recalls the role of the information systems which shed light on the agents' behaviors and allow the principal to control them. If you can track the firm's activities you can define rules driving the right behaviors. If you can define the outputs of the activities you can fix targets leading towards effective actions. The first form of control is the bureaucratic control, the second form is the market control. You can also inspire correct behaviors by emphasizing the usefulness of them. This is the clan control which needs a community of people (Ouchi, 1979). Actually, a literature review focused on field experiments shows that monetary incentives are not the only ones to increase employees' performance. It identifies other mechanisms: a meaning assigned to a task or social recognition which the organization can manifest, for instance, by awards, praise or showing gratitude; reciprocity because when employers are generous with employees, the latter ones will be more productive to give the favor back to the former ones; social ties which, for instance, prevent employees from running actions damaging friends; the work organization such as working from remote (Levitt, Neckermann, 2014).

This does not mean that the traditional incentives lose their validity (Lee, Puranam, 2017) even though they can be moderated by other factors (Tenhiälä, Laamanen, 2018; Oxley, Pandher, 2016; Feldman, Montgomery, 2015; Chng, Rodgers, Shih, Song, 2012). In particular, a rigorous field study in the agricultural industry shows that a contract guaranteeing a larger percentage of crop for the tenant generates positive effects in terms of tenant's risk propensity and in terms of investments from the tenant. Those effects are the channels through which the production principal-agent sharing increases the level of the production itself with more outputs (Burchardi, Gulesci, Lerva, Sulaiman, 2019). An auto glass company replacing the old payment system based on the hourly wages with a

new one based on the number of installed pieces was the perfect context to run an experiment which shows a positive effect of a pay for performance method on the productivity (Lazear, 2000). In the education industry the role of incentives for teachers is controversial: some do not find evidence of effects on the students' performance (Fryer, 2013) others do. Students' performance based-incentives for instructors create positive effects on students' performance within the context of college education (Brownback, Sadoff, 2020). Schools can reduce teachers' absenteeism and increase children's performance by adopting two leverages together: a camera system controlling teachers' presence and monetary incentives. Children's performances are measured with the test scores and the chances to access the next level of education which the government provides. In this experiment monetary incentives depend on attendance (Duflo, Hanna, Ryan, 2012). Also, when monetary incentives depend on students' achievements, they generate better results in terms of achievements themselves (Lavy, 2009). Students' achievements are short-run benefits coming from the pay for performance interventions which also create long-run benefits measured by the level of employment and the level of wages (Lavy, 2020). In addition, monetary incentive for teachers seems a more efficient policy than the one investing in empowering the teaching services for students. The former policy's benefits in terms of students' results relative to the costs are bigger than the ones from the latter policy (Lavy, 2002). Incentives policy allows a higher students' performance/investments ratio than other policies which provide funds to buy school materials or to hire one more contract teacher. In addition, the incentives policy does not generate negative outputs but it generates complementary positive results (Muralidharan, Sundararaman, 2011). Incentives assigned to students, teachers, and administrators for the same goals generate better performance than the situation where just students or just teachers are rewarded (Behrmann, Parker, Todd, Wolpin, 2015). Accountability does not generate positive effects for all the students. Only the performances of students whose scores really allow the schools to improve their ranking benefit from the introduction of the ranking itself (Deming, Cohodes, Jennings, Jencks, 2016).

Transparency is considered to be the cause of many phenomena. If companies allow customers to visualize the organizational activities, companies contribute to increase utility for both the customers and the companies themselves, particularly for the companies' employees (Buell, Kim, Tsay, 2017). Posting on the web the wages generates salaries reduction in public sector (Mas, 2017). A larger

transparency level defined by a performance feedback including a comparison with their peers reduces the students' performance but the reduction lasts for a short time, it also increases the satisfaction for the courses, perhaps as a positive reaction to the satisfaction for their own relative performance (Azmat, Bagues, Cabrales, Iriberry, 2019). Firms can generate pressure on workers by informing them about their colleagues' relative performances. Performances are expressed in terms of rank-order position which represents an effective managerial tool. It rises the productivity without negative spillovers such as damaging effects on the product quality (Vidal, Nossol, 2011). Firms can implement a policy that informs workers about their colleagues' performances and their own performances. Such a policy helps to improve the performances themselves only if the organization adopts a top-down organizational structure where the power is concentrated at the top which leads the lower levels inspired by egoistic targets. Instead, empowering the bottom with flat organizational structures where a collaborative philosophy is applied dissolve the positive effects of the performance communication on the performance itself. In addition, those effects occur only if the company communicates the name of the worker along with the level of her/his performance. Using an identification code, the effects disappear (Blader, Gartenberg, Prat, 2020). Middle managers are not interested in the historical trend of their performances, they are interested in the peers' performances which push middle managers to generate strategic changes if the peers' performances relative to their own performances become higher (Tarakci, Ateş, Floyd, Ahn, Wooldridge, 2018).

The methods adopted to solve the agency problem are the same mechanisms allowing the strategy execution (Simons, 2014): Management can improve performance by the traditional mechanism which assigns targets to employees and rewards the employees with monetary prizes when they achieve their targets (Corgnet, Gómez-Miñambres, Hernán-González, 2015). Strategy execution is an essential process to benefit from effective deliberate strategies and to trigger strategic learning for improvement (Lee, Puranam, 2016). Its methods belong to the family of the management tools whose importance in terms of economic impact for organizations is proved by rigorous studies (Bloom, Eifert, Mahajan, McKenzie, Roberts, 2013; Bloom, Lemos, Sadun, Reenen, 2015; Bloom, Sadun, Van Reenen, 2012). Management tools help organizational effectiveness which is not strategy because competitors can reproduce it by replicating the imitable management tools themselves (Porter, 1996). 'Competitive strategy is about

being different. It means deliberately choosing a different set of activities to deliver a unique mix of value' (Porter, 1996: 39). At the same time large datasets show that management tools provide competitive advantage which does not disappear in the short-run. Operational effectiveness is something to pursue along with a precise competitive position with the same target: to get superior financial performance (Sadun, Bloom, Van Reenen, 2017). A field experiment examines the flight captains' reactions to management practices. The experiment contributes to the organizational economics by exploring a high professional context and specific managerial practices. An after-before research design shows that monitoring increases productivity. A difference-in-differences design shows that productivity also increases because of target assignment and by informing captains about their performance. Instead, it is not affected by the charity support which the corporation provides to the society if the captains achieve their targets. The monitoring effects last over time, the target assignment effects and the feedback effects tend to disappear. Positive effects on productivity are not balanced by negative spillovers such as delays or safety alterations. Finally, captains' reactions are heterogeneous, the experiment uses several measurements of productivity but the productivity effects do not depend on a group of captains raising the productivity measurements all together. Some captains are able to improve some productivity measurements, other captains affect other productivity measurements (Gosnell, List, Metcalfe, 2020)

Non-financial measurements such as the ones of the balanced scorecard help organizations even beyond the attempt of better shaping the interplay between the principal and the agent, actually they help: (1) to communicate the strategic intentions to the members of the organization, (2) to let them know what the strategy execution means within their specific responsibilities and tasks, (3) to generate reactions from managers and employees which turn unexpected events into a dynamic aligned to the strategic goals and to the organizational values (Gibbons, Kaplan, 2015).

### **3 The Setting**

The fact that also operational effectiveness is central seems true in the higher education industry where competitiveness is measured by international rankings such as the Shanghai ranking which weights the following indicators:

1. 'the total number of the alumni of an institution winning Nobel Prizes and Fields Medals'
2. 'the total number of the staff of an institution winning Nobel Prizes in Physics, Chemistry, Medicine and Economics and Fields Medal in Mathematics'
3. 'the number of Highly Cited Researchers selected by Clarivate Analytics'
4. 'the number of papers published in Nature and Science between 2015 and 2019'
5. 'total number of papers indexed in Science Citation Index-Expanded and Social Science Citation Index in 2019'
6. 'the weighted scores of the above five indicators divided by the number of full-time equivalent academic staff' (<http://www.shanghairanking.com/ARWU-Methodology-2020.html>)

In order to get a better position in the ranking a school needs to improve along the above dimensions which are the same for any organization in the industry. If school leaders aim to get a higher position they have two options: they can try to do something unique or they can increase the level of the operational effectiveness (Porter, 1996; Sadun, Bloom, Van Reenen, 2017). The first choice seems suitable to jump from a low position to a high position over the long-run improving along the first indicators radically. Instead the second choice seems the right one to gain few positions over the short-run improving the last indicators incrementally, particularly the indicator number 5. Then, it seems interesting to examine the tools which implement the strategy and affect the operational effectiveness in the higher education context.

#### **4 Research Design**

Making information public on internet provides an effective treatment to figure out the effects of the transparency on other variables through a natural experiment (Perez-Truglia, 2020).

In 2014 the University of Milano-Bicocca made the results of the courses valuations from the students public. This policy represents a valuable occasion to understand the effects of the personnel valuations' internet diffusion on the performance. Actually, it allows to conduct a natural experiment by dividing the classes' performance into two groups:

1. a group treated by the internet diffusion of the valuations from the students
2. a group untreated by the internet diffusion of the valuations from the students.

The first group corresponds to the performance after the 2012/2013 academic year and the second group corresponds to the performance before. Mathematically:

$$Y = \alpha + \beta X$$

Y= performance

X = personnel valuations diffusion (treatment)

X is equal to 1 for the treated group (after the 2012/2013 academic year) and 0 for the untreated group (before).

This paper adopts a before-and-after research design (Vidal, Nossol, 2011; Perez-Truglia, 2020; Bandiera, Barankay, Rasul, 2007). The dependent variable corresponds to 'customer satisfaction', measured through surveys for the course evaluation from students (Azmat, Bagues, Cabrales, Iriberry, 2019).

## 5 The Dataset

The dataset is pulled from the University of Milano-Bicocca's report on the "Didactic Valuation. Program of Monitoring of the Didactic Activities Academic Year 2014/2015" (Nucleo di Valutazione, Università degli Studi di Milano-Bicocca, n.d.). The report shows the percentage of the positive scores got for each field:

1. "Economics - Statistics"
2. "Law"
3. Medicine
4. "Psychology"
5. "Science"
6. Humanity
7. "Sociology".

The survey for the students includes four levels of satisfaction: "No for sure", "more no than yes", "more yes than no", and "yes for sure" (Nucleo di Valutazione, Università degli Studi di Milano-Bicocca, n.d.: 7). The last two levels are considered to be positive scores in the report. The report shows 11 dimensions of the performance. Those dimensions correspond to the questions in the survey formulated for the students. The dimensions are:

1. Adequacy of the knowledge acquired from the requirements
2. Student's efforts commensurate to the credits
3. Material suitability
4. Exam's format
5. Punctuality
6. Teacher's ability to rise the students' curiosity
7. Clarity in teaching
8. Usefulness of other activities different from the class
9. Availability of the teacher to better explain the content of the class
10. Interest on the class's content
11. Overall satisfaction on the classes (Nucleo di Valutazione, Università degli Studi di Milano-Bicocca, n.d.).

We have four waves: 2011/2012 academic year, 2012/2013 academic year, 2013/2014 academic year, 2014/2015 academic year.

## 6 Findings

The following table (table 1) shows that the treatment increases the performance. The coefficient is highly significant. The treatment increases the performance by almost 2.7. Because of the treatment the students evaluating positively their classes increase by 2.7 per cent.

In this regression we control for the dimensions of the performance (the questions in the survey). This control variable should isolate the effects of the treatment from the fact that we measure the performance with different measurements (i.e. dimensions of the performance/questions in the survey).

Table 1: Results of the Internet Diffusion Policy on the Performance

VARIABLES	Performance
Treatment	2.695*** (0.408)
Constant	75.02*** (0.706)
Observations	308
R-squared	0.670

Standard errors in parentheses

\*\*\* p<0.01, \*\* p<0.05, \* p<0.1

## 7 Discussion

This paper confirms that the Mayo's Hawthorne effect (Roethlisberger, William Dickson, 1966 as cited in Zaleznik, 1984) works. It acts if the personnel behaviors can be observed publicly by showing the work performance on internet.

The Agency Theory's divergence between the principal's targets and the agents' behaviors (Smith, 1776 as cited in Dalton et al. 2007; Berle, Means, 1932 as cited in Dalton et al. 2007) can be reduced by the public diffusion of information about the agents' performance. Moral hazard (Eisenhardt, 1989) is restricted by the diffusion power available for the organizations in the modern environment.

It is a form of control which leverages information systems (Eisenhardt, 1989). It combines the traditional market control measuring the outputs and the social dimension of the clan control (Ouchi, 1979) without the traditional financial incentives (Lee, Puranam, 2017). Information systems measure the outputs and make them visible to all the people who generate a sort of social pressure on the agents reacting by improving performance.

This form of control can help strategy execution which is always productive because it generates learning and it allows to implement promising deliberate strategies (Lee, Puranam, 2016) differentiating firms for a long run competitive advantage (Porter, 1996). This form of control also can increase the operational effectiveness, another source of competitive advantage (Sadun, Bloom, Van Reenen, 2017). Our experiment contributes to the stream of literature which demonstrates that managerial practices are relevant in economics because they improve performance (Bloom, Eifert, Mahajan, McKenzie, Roberts, 2013; Bloom, Lemos, Sadun, Van Reenen, 2015; Bloom, Sadun, Van Reenen, 2012). This paper's results encourage organizational leaders to leverage the internet diffusion power as a managerial practice which improves performance.

Studies on management practices remark the importance of two aspects:

- 1) It is useful to focus on professional positions with huge skills, a strong sense of responsibility, a clear idea of their role and a strong commitment to the credo of their organization. People think that those positions do not need managerial practices which might be rejected and unproductive but the literature has not studied those positions too much (Gosnell, List, Metcalfe, 2020). Particularly the literature researching the incentive effects targets workers with

modest duties but today many jobs are pretty complex (Levitt, Neckermann, 2014)

- 2) Previous literature demonstrates that the management practices improve performance but they run experiments which implement several management tools all together. Little is known about the effects of each single tool (Gosnell, List, Metcalfe, 2020).

An experiment treats professionally advanced positions: the captains who have the features mentioned above. Those features are similar to the features of other professionally advanced positions such as the ones of doctors or researchers. The experiment finds that the managerial practices increase the productivity in the context of captains (Gosnell, List, Metcalfe, 2020). Our study confirms that the managerial practices improve the performance of professional advanced positions because the experiment treats university professors in the context of the higher education. The experiment confirms the effectiveness of the managerial practices in another specific context with other professionally advanced workers.

The experiment on captains shows the effectiveness of specific practices such as the goals assignment by disentangle a practice from the others (Gosnell, List, Metcalfe, 2020). This paper focuses on a different specific practice which makes the workers' performance public through internet. This paper finds that this specific practice is effective because it increases the performance.

Most of the models employ students' performance (Brownback, Sadoff, 2020; Lavy 2009; Lavy, 2020; Lavy, 2002; Muralidharan, Sundararaman, 2011) or productivity (Burchardi, Gulesci, Lerva, Sulaiman, 2019; Lazear, 2000; Vidal, Nossol, 2011; Gosnell, List, Metcalfe, 2020) as dependent variables to figure out the effects of the management practices in the organizations. This paper adopts a wide measurement of customer satisfaction which is the dependent variable. The measurement captures several aspects of teaching and this paper finds a positive effect of the managerial practice on the customer satisfaction: students get happier for their teachers' work because of the implemented management practice.

Non-financial measurements help to push employees toward the implementation of the deliberate strategy because the employees learn which goals they should achieve within their own task to contribute to strategy implementation. Non-financial measurements also stimulate employees' reactions to changes and those reactions adjust the firm's dynamic in such a way that the strategic targets will be achieved despite the changes (Gibbons, Kaplan, 2015).

This paper tests the effects of transparency on the effectiveness of non-financial control system which measures non-financial performance. The paper shows that transparency makes this system more effective because what the system measures improves. If firms show the results on internet the system works better.

Many studies evaluate the effects of teachers' incentive policies by measuring the students' performance as a reflex of the teachers' effectiveness (Brownback, Sadoff, 2020; Lavy 2009; Lavy, 2020; Lavy, 2002; Muralidharan, Sundararaman, 2011) even though the policies target the teachers' behaviors rather than the students' behaviors. Instead this paper measures the target of the policy itself: the teachers' behaviors which are measured by the evaluations from the students. Because this paper focuses directly on the effects targeted by the policy, it seems less likely that the dependent variable variation is due to other variables different from the policy itself. Instead in the other studies it is more likely because they focus on students' performance which are hit indirectly: through the channel of the teachers' behaviors. It is more likely that students' performance comes from other independent variables affecting teachers' behaviors also.

Transparency is an important lever to improve many aspects such as the value for both the company and the customers (Buell, Kim, Tsay, 2017), the levels of the salaries in the public sector (Mas, 2017). It also improves behaviors of workers (Vidal, Nossol, 2011; Blader, Gartenberg, Prat, 2020) and middle managers (Tarakci, Ateş, Floyd, Ahn, Wooldridge, 2018) when they learn their relative performance: how they perform in comparison with their peers (Azmat, Bagues, Cabrales, Iriberry, 2019; Vidal, Nossol, 2011; Blader, Gartenberg, Prat, 2020; Tarakci, Ateş, Floyd, Ahn, Wooldridge, 2018). Particularly, a study suggests that only a high level of transparency increases performance: if the performances are not associated with the name because they are associated just with a code, the positive effects of their communication to the workers are cancelled (Blader, Gartenberg, Prat, 2020). The level of transparency matters. The transparency increases professors' performance in our experiment also, but our experiment tests the highest level of transparency, actually professors know the performances gotten in their organization but the school also shows the performances to all the public posting them on internet. Our experiment administers the strongest dose of transparency to increase performance and it apparently works.

In addition, transparency about the relative performance seems to work only in organizations based on hierarchical structures, it does not produce positive effects if it is applied in flat organizations (Blader, Gartenberg, Prat, 2020). Instead,

a stronger dose of transparency showing performance on internet allows to improve performance in flat organizations also. Our experiment treats university professors who work with a high level of autonomy. They do not need to follow strict guidelines and rules coming from the top.

Studies on social comparison seem controversial. On the one hand, social comparison is supposed to downsize the performances (Ashraf, Bandiera, Lee, 2014; Azmat, Bagues, Cabrales, Iriberry, 2019). On the other hand, social comparison is supposed to make performance higher (Vidal, Nossol, 2011). Fine-grained analyses seem to reconcile those two opposite results by deeply investigating the specific practices used for social comparison in specific contexts. A reconciliation is possible by showing which tools work and which do not or it is possible by showing where they work and where they do not. It might be that only some practices work or it might be that they work only in certain contexts. This could explain the controversial results from general studies. Deeper analyses show:

- 1) The positive effects of the social comparison using the name of the workers versus the null effects of the comparison using the codes (Blader, Gartenberg, Prat, 2020)
- 2) The positive effects of the social comparison within hierarchical structures versus the null effects of the comparison within flat organizations (Blader, Gartenberg, Prat, 2020).

Also this paper makes an attempt to reconcile the two opposite results with a fine-grained analysis which explores what happens with a particular practice in a specific context. The paper finds the positive effects of the social comparison using the powerful tool of posting the performances on internet in the specific context of the higher education. Farther analyses could examine specific tools for social comparison in specific organizational contexts to figure out if those tools work in those contexts.

In higher education professors are free to choose how to teach and how to improve their performance. As in the case of middle managers, transparency stimulates emergent strategies (Tarakci, Ateş, Floyd, Ahn, Wooldridge, 2018) because in higher education students' satisfaction increase comes from the professors' ideas and it comes from their independent initiatives which are formulated at the bottom of the organization. In addition, professors autonomously implement those initiatives in classes, at the periphery of the firm.

Ranking improves performance but only for a group of students if only that group contributes to affect the ranking with its performance (Deming, Cohodes, Jennings, Jencks, 2016). A selective mechanism which restricts the performance evaluation within a certain group restricts the positive effects within the group itself. A wider mechanism such as the one adopted in our experiment does not restrict the performance evaluation within a certain group of people and the mechanism seems more effective because it does not limit the positive effects also.

On the one hand, we have managerial practices which absorb less resources than the financial incentive policies: prizes and gratitude for instance (Levitt, Neckermann, 2014). On the other hand, comparing investments with results, the incentive policies are more efficient than other policies such as the ones which: (1) improve the teaching services (Lavy, 2002), (2) allow to use more materials or (3) provide another teacher (Muralidharan, Sundararaman, 2011). Posting performance on internet seems a very efficient policy even more than the incentive policies because its costs are very low. The incremental costs are almost equal to zero because the policy just shows already available data.

## **8 Limitations, Alternative Explanations and Future Development**

On the one hand, the downside of the research design is that we have just two groups: before and after. We do not have four groups: treated, untreated, before and after.

On the other hand, the research design's upside is the context whose boundaries are very definable. This study is limited to the University of Milano-Bicocca's classes over four years. In this context it is very challenging to think of unobservable variables because we cannot see other 2014 interventions able to affect teaching performances.

Nevertheless, we identified other schools which were treated before 2014 or they were not treated at all. Then, hopefully we can collect data to run a placebo test on schools which were not treated (Perez-Truglia, 2020) or to run the same experiment with other schools treated in a different year. Those robustness checks should help to make the results more rigorous.

## Knowledge Governance in Higher Education Research

---

Isabel Pinho

Govcopp  
University of Aveiro  
Campus Santiago, Aveiro, Portugal

### Abstract

This paper aims to presents an exploratory map of Higher Education Research. Using science mapping approach can help to locate a scientific domain of our own interest, and can be a starting point for a deep understanding of themes and subthemes of areas of research activities, and identifying the dynamics of knowledge networks that link institutions, researchers and publications. Instead of considering islands of specialized knowledge we can use maps to link and integrate knowledge and identify gaps. Future developments of this work will provide potential avenues for new studies that will provide answers to the questions that have emerged.

**Keywords** – Knowledge Governance; Higher Education Research; Mapping; Research

**Paper type** – Academic Research Paper

### 1 Introduction

By taken a knowledge Governance approach (Pinho et al., 2019) we can focus on a specific context (Higher Education Research) to begin mapping this field. Higher Education Research (HER) is developed from a complex process with its own dynamics. As a concept HER is not easy to define because it is associated with a sense of belonging and identity, namely that which relates to the communities of researchers who receive and contribute to a multi and interdisciplinary field (Brew et al., 2016; Kehm, 2015; Tight, 2004).

From current literature and using Biglan model of disciplines classification Biglan (1973) we locate each position of diverse academic disciplines along scales based on the dominant paradigm (Chynoweth, 2009).

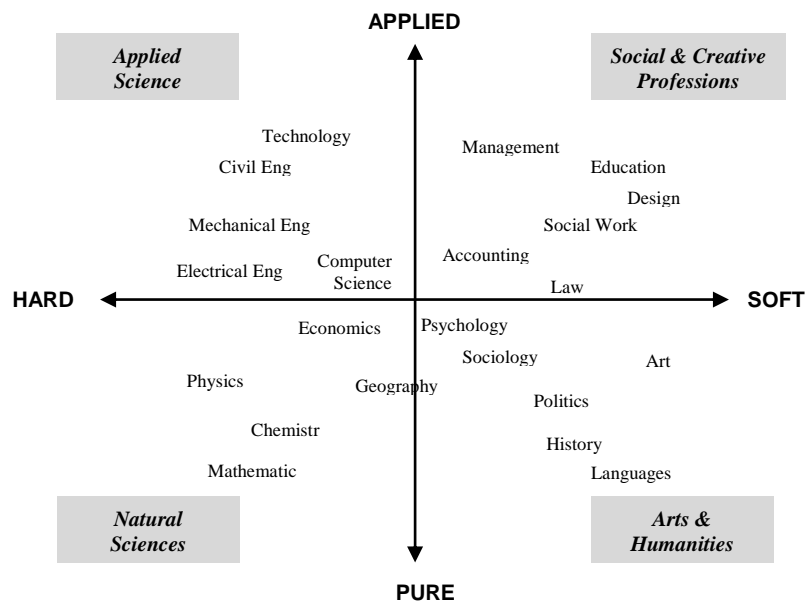

Figure 1- The location of the scientific fields according to the Biglan model  
Source: build from Biglan (1973)

Each discipline has a relative position inside a matrix structured in two axes: the horizontal axis defines a space across "hard" and "soft" scale, while the vertical axis use "applied" and "pure". Scale. Thus, four quadrants are defined where the different disciplines are positioned: Natural Sciences, Applied Sciences, Social and Creative Professions, and Arts and Humanities. Education appears in the upper right quadrant (soft-applied), that is, located in Social and Creative Professions (see Figure 1).

## 2 From isolated islands to knowledge networks

The research agenda in the scientific field "Higher Education" can be structured in a dichotomous taxonomy; we can divide the HER studies into two main areas: a) Policies and b) Teaching and Learning. Each of these areas includes various categories or research themes (see Figure 2).

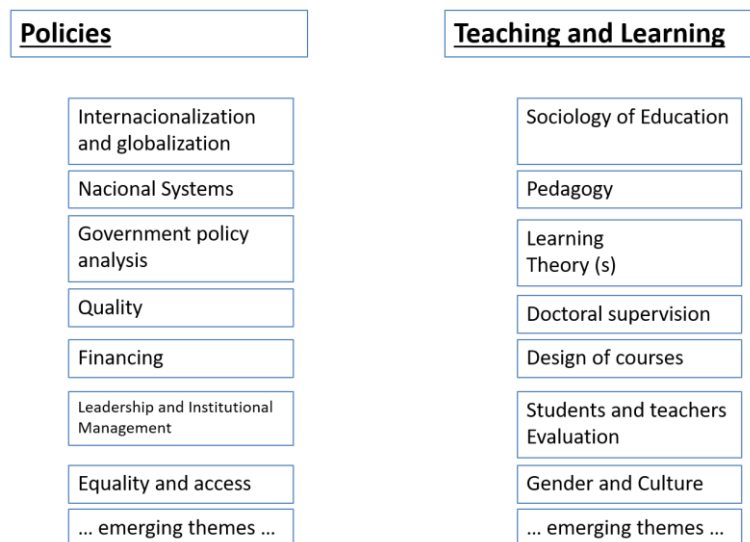

Figure 2 - Main Areas and Topics of Higher Education Research  
Source: build from Tight (2004)

This type of dichotomous taxonomy comes from the idea of working in silos or looking at research areas as isolated and close knowledge spaces (Tight, 2004).

In fact, it may be more elucidating to present Higher Education Research by mapping its themes, methods, and theories as a structure of the field. Using the archipelago metaphor, HER can be seen as "archipelago" formed by islands relatively positioned in two great thematic clusters (Macfarlane, 2012). But, we see these "islands" interconnected through the intersection between themes, models and theories not only within this scientific field as of other fields building networks. Thus networks of knowledge, researchers, and subjects are formed in a dynamic way, sometimes dependent on the demand of society and the very life of Higher Education Research (see Figure 3).

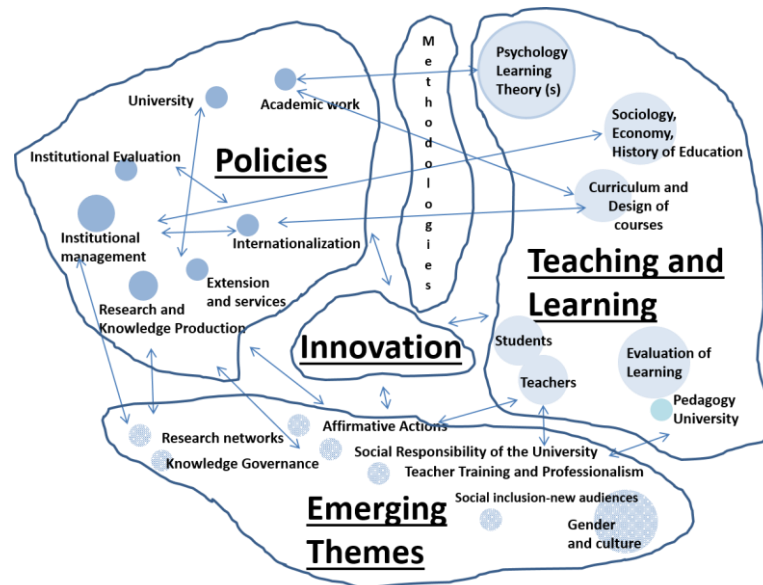

Figure 3 - Networks and Themes in Higher Education Research

Motivated by X SIES debate with relevant HER researchers (International Seminar on Higher Education at Porto Alegre, Brazil in 2017), we assign Emerging Themes to MacFarlane design by creating a new island (Leite et al., 2019; Sérgio et al., 2019). This is a collaborative process by sharing knowledge, by using maps to build and understand the research trajectories of research groups and to facilitate design research agendas (King et al., 2014; Prosser, 2011).

In organizing the design, we visualized symmetries among the themes, some provoked by the research and collaboration networks, and the archipelago, in gathering the themes, acquired the form of a dynamic system. As in the human body, we find the respiratory system, two great lungs - Policies and Teaching-Learning are placed side by side of Methodologies and supported in Emerging Themes. At the center of the system, the 21st-century version breathes with the theme of Innovation, technology and, also, pedagogical.

In short, Higher Education Research is an multidisciplinary field of study, that encompasses studies that focus on the understanding of all aspects of Higher Education and which we can located in four major areas: a) Policies; b) Teaching and Learning, c) Innovation and d) Emerging Themes. The Methodologies constitute the structuring column that legitimizes HER as a consolidated area. Inside Policies area we can classify some subthemes, like Internationalization,

Institutional Evaluation, Institutional Management and Research and Knowledge Production. We can add Education System, National Policies, Comparative policy studies and Funding.

Teaching and Learning area can be considered the core of HER because here we can find its main actors (students and teachers) and the main processes (Curriculum and Design of courses, Learning Evaluation, Pedagogy and Research academic work).

Linking Policies area and Teaching and Learning area is the challenge because sometimes actors work isolated. Teaching and Learning is the social space for the implementation of policies. Innovate ways of teaching and learning, new evaluation approaches, new ways of implementing and monitoring policies can facilitate this link; these themes can be part of the Innovation area, which is at the centre of Figure 3.

Methodologies area, also at the center of Figure 3, is a structural element of HER that need to be improved. There are variations in the popularity of method approaches between the disciplines that perform research on HER, such as surveys and multivariate analyses, documentary analyses and interview-based studies (Tight, 2013).

At the bottom of the Figure 3 we draw the "Emerging Themes" area where some subthemes are located, such as Research Networks (Leite & Pinho, 2017), Knowledge Management (Rego et al., 2009), Affirmative Actions (Silva & Skovsmose, 2019), Social Responsibility of the University (Giuffré & Ratto, 2014), Teacher Training and Professionalism (Carvalho & Santiago, 2015), Social Inclusion (Araujo et al., 2020), new audiences (Pinho & Diogo, 2018) or Gender and Culture (Jordão et al., 2020).

The HER tends to be robust discipline with an international and theoretical background and increasingly performed in a collaborative way (Forsberg and Geschwind, 2016). These studies tend to be interdisciplinary studies and their themes result from the intersection and contribution of traditionally separate fields (Forsberg & Geschwind, 2016).

Emerging themes, such as knowledge networks, co-authorship and collaboration in research (Leite *et al.*, 2014a) show the evolution of HER to a research agenda concerns linked with: a) syntheses local and global application and b) connection of theory with practice (Ertmer & Glazewski, 2014; Pinho, 2018). An example of this research agenda development is the evaluation of collaborative research networks (Caregnato *et al.*, 2018; Leite *et al.*, 2018a; Leite *et*

*al.*, 2014b; Leite & Pinho, 2017; Leite *et al.*, 2018b). As Denise Leite and Isabel Pinho wrote "the global context of science, it is possible to observe changes in its landscape, particularly in terms of new patterns of production (Leite & Pinho, 2017, p. 103). Knowledge production processes involve thinking and rethinking about what researchers do, how they do research and how they publish and create knowledge. Knowledge production processes are enriched and potentiated by the collaboration of multiple researchers. Researchers create collaborative networks that seek to integrate diverse knowledge and expertise. For Katz and Martin (1997, p. 7) "research collaboration is the working together of researchers to achieve a common goal of producing new scientific knowledge". Taken this collaboration view it is possible say that higher education research is an interdisciplinary field of research in which multiple communities of practice operate (Tight, 2004).

### **3 Conclusions and future developments**

Taking the visual metaphor of islands to locate themes in a sea of disciplines that explicated tribes and territories can facilitate the understanding how researchers work and specialize in research (Becher & Trowler, 2001).

The main output of this exploratory study is the map (Networks and Themes in Higher Education Research). This result is a starting point to Reflection-on-action that involves taking the opportunity to draw on the professional knowledge base more explicitly (Thompson & Pascal, 2012). This map can be used to: (1) develop our understanding further; and (2) test and develop the knowledge base.

This exploratory study is the first cycle of our research. By questioning we will start a new research cycle. Next we follow to a process of developing the conceptual framework for exploring relevant literature.

This future study aims to answer some questions at higher education research scope, such as:

- What has been investigated and inherently what are the gaps?
- Who is undertaking this research, and from what institutions or disciplinary locations?
- How is higher education being researched?
- What methods and methodologies are being used?
- What theoretical perspectives are being applied to this research?

- What are the most important scientific clusters formed in the historiographical map of HER publications indexed in WoS or Scopus during 2001-2021?

- What are their subject areas?

- What are the international research trends in the HER and each of its sub-domains in the last ten years?

-What are the patterns of relationships between HER Researchers?

-What are the knowledge networks patterns of relations inside each cluster?

Looking research as an iterative or cyclical process, we need combining qualitative and quantitative methods to give relevant answers (Denton, 2019).

One of the studies that we are going to develop is based on bibliometric analysis the HER main themes to answer research questions, exploring the analysis of keyword co-occurrence networks and document co-quotations. In the case of citation relations, an additional distinction can be made between direct citation, co-citation and bibliographic coupling (Moresi et al., 2021). Another way can be the systematic review that can is a block to build a framework of analysis. If we look at Literature Review as a qualitative research we can use content analysis as a tool to identify relevant literature; those papers can be read and analysed with support of digital tools (Fornari et al., 2019; Pinho & Leite, 2014). Additionally, qualitative content analysis of the relevant publications based on the clustering results can be used.

Both the novice and the experienced researcher can use mapping to locate themselves in the field of research. Research centers can build their Research Strategies and perform their research agendas in a structured and integrated way.

### **Abstract**

It's the changed that education made and the introduction of Informatic Technologies (ICT), gave in a drastic way to get ahead with external healt factors such as the pandemic (COVID-19)

It's important to say that the University of Guadalajara has a project named B-learning, this with the objective that the students can work and study at the same time, they have to go only twice a week.

In 2019 it was a pilot test, that became a reality, but the problems came up because here in Mexico we are used to go to school and have classes face to face and also we use ITC just for social media and we don't use it for learning or educational tool.

Early January 2020 this project had a lot of competitive advantages for the University of Guadalajara and now all this projects are being structured, this just for the purpose to support all the students.

Previously the University had inverted classes, this means the student explain all the topics for the class and the professor help with all doubts.

In another aspect, courses were taught as they were previously called mixed and today with the name of hybrid education.

This research are the results of the investigation we did on February 2020 to December 2020, we tried to explain how evolve hybrid education at the University of Guadalajara.

The most important is doing the cultural change in the education of Mexico, we tried to explain that it's possible to make hybrid education and we can make the entire student more competitive. Beside all those closed companies, we think in alternatives for new jobs and strategies to maintain business.

**Keywords:** ITC, Competitiveness. B-Learning, Hybrid Education

**Paper type** – Academic Research Paper

## 1 Introduction

This research is the result from February to December 2020 with the occurrence from the Pandemic (covid-19) and the transformation of education – learning of students from University of Guadalajara, Mexico, CUCEA Marketing and International Business department. How were the changes, strategies that each professor made and all the results from the students from a face to face learning to a hybrid education?

ICT needs more recognition as a learning tool and not just for social media.

In Mexico we have lots of deficiencies which we needed to overcome and this way we could change classes in hybrid education.

On the other side, we need to see the results from graduating students with this new education two semesters and the results of their competitiveness and knowledge are shown in the graduated exam from the University.

Analyze this result to have better students that started the University on February 2020A and 2020B they didn't have face to face classes, they had hybrid education 100%.

We are waiting for the pandemic to stabilize and we could return to the classroom and we could take classes face to face and hybrid at the same time. The changed that all the signature programs had to face because some classes are obligated to be face to face, advertising workshop or international business.

### **1.1 Justify**

One of the conflicts is to educate students that ICT's technologies are not only for social media, they are also educational consultation, research, complication for all kinds of activity. Both for business and the growth of them or the disappearance of them as happened.

For lack of external factor strategies that the world faces.

Based on this contingency the University of Guadalajara saw the need for each of the professors and students to acquire technological skills for development and not a stagnation in higher education.

Another of the problems that we have in Mexico, here we don't have the infrastructure of the internet for the population or the confidence to make purchases online or the use of digital banks. But for the contingency (Covid- 19) increase up to 50% of its use.

An important factor, it's that students don't have the resources for a computer, tablet or smart phone.

This was one of the first problems we had. The University of Guadalajara starts to help the students by lending equipment and giving to them internet.

In Mexican families are made up of at least 3 students of different levels in which they need a computer and internet.

What we can say from hybrid education it's that we were adapting to each of the students to reach a standard and be able to give the sessions together with platforms, multimodal communication for learning.

## **2 Problem, Hypotheses and Rationale of the Study**

In this research, we are waiting for the results from the graduated students that made the exam and another factor are the students that haven't been in face to face classes this 2020 the question it's, their knowledge was appropriate?

### ***Research questions.***

Did the use of hybrid ICT really work?

What are the adequacy of hybrid education and ICT we must change?

### ***Specific questions***

1. - Which platforms were most suitable for hybrid education at the University of Guadalajara, Mexico in CUCEA in the department of International business and Marketing?

2. - Is the use of moodle safer for hybrid education with the application of ICT?

What was the learning of the two semesters compared to 2020A and 2020B with hybrid education?

3. - Teachers who compare can be given with their hybrid education and ICT's?

### ***General Objectives***

Does hybrid education and ICT show good results with the application of the graduate exam?

### ***Specific Objectives***

Determine which factors influenced with hybrid education for students?

What strategies does the University of Guadalajara, Mexico take to train their professors with ICT?

What were the deficiencies of students with the graduate exam this year of pandemic 2020A – 2020B?

### ***Hypothesis***

1. Determine which factors influenced with hybrid education for students?
2. What strategies does the University of Guadalajara, Mexico take to train their professors with ICT?
3. What were the deficiencies of students with the graduate exam this year of pandemic 2020A – 2020B?

### **Congruence chat**

<b>Problem</b>	<b>Questions</b>	<b>Specific questions</b>	<b>Objectives</b>	<b>Hypothesis</b>
In our research we hope await the results of the graduates in the department of International business and Marketing. Those who applied. Another factor: students who have not had a face-face class. The result of your learning is correct.	Did the use of hybrid ICT really work? What are the adequacy of hybrid education and ICT we must change?	1.- Which platforms were the most suitable for hybrid education in the Universidad de Guadalajara, Mexico, in CUCEA en el in the department of International business and Marketing? 2.- Using Moodle is safer for hybrid education with application of ICT's? 3.- Which it was the result hybrid learning 2020A y 2020B 4.- The teacher who results had with the hybrid education and the ICT's	The hybrid learning and ICT's have good results for graduates?	1. The greater the use (e-mail, WhatsApp), the greater the learning result.  2. Having videos recorded by teachers gives students more knowledge  3. The more contact with videoconferences, the more learning.

### **3 Literature Review**

*Education. Microsoft.com 2020*

Virtual environments are those created through the use of information and communication technologies, in order to provide educated people with resources that facilitate their learning process, within these ICT can be quoted the computer, cannot a virtual classroom, the use of the internet where they can access blogs, discussion forums, chat, specialized pages in which young people find fun activities, such as solution to crossword puzzles, puzzle, etc.

Which well employees contribute greatly to the acquisition of learning by the students. Duarte, J. (s.f)

Educative strategies that can be included, Garcia, L (s.f)

The strategies are:

- Collaborative learning
- Simulations
- Elaborations of conceptual maps, mind maps
- Practices in laboratory or workshop
- Conferences
- Demonstrations
- Learning problems.
- Playful activities

In the case of the use of Information Communication technology: The use of internet, e-mail, discussion forums

Classroom plan Lopez; R

It said that some authors said they are 3 steps:

1. - To whom? (students)

What, when, how and why?

2. - What, curriculum content and technology

Curriculum content:

Objective

Learning

Technology content:

Skills to help students

Which type of technology for learning

Which ICT we need

And which digital resources.

3. - How (strategies and actions)

Strategies and actions

Time

### **3.1 Resources**

With this contingency professors are changing their role, now they are not only education mediator they are also tutors for the students.

Taking as a basis that in some subjects it was implemented in making videos and gave a competitive advantage to students who could review the material (video) as many times as they wanted and be able to understand the subject.

In some others, lean on video since they are on some platforms and some companies apply them.

The time came when the teaching- learning was on both sides to understand everything related to ICT and their applications for both professors and students.

According to Marzano (1998) explain on his work named "The five dimensions of knowledge", he mentions that the first dimension is about to the student's attitudes and perceptions and what does it refer to?, he grounds that the students could get a success knowledge, the classroom climate must be taken into account, that is affective factors influence, such as being accepted by their peers, as well as space-infrastructure, refers to feeling comfortable in the phsycial plant.

With this new modality it was hard to apply the five dimensions of Manzano (1998) and this just with the situation of each student and the different factors.

1. - Computer equipment. (How many?)
2. - Cellular
3. - Tablet
4. - Internet service in their home.
5. - An Internet plan.
6. - How many people in their home receive classes at the same time?
7. - A special place to take the classes.
8. - Their camera really work ( complication for the students to know each other)

The mentioned will help us to organized appropriately the teaching – learning process, currently the scenarios have changed, not forgetting that today we can make use of classroom, real and virtual ones, the last one now it's called " new learning environment"

According to UNESCO , for this global pandemic has been affected more than 861.7 millions of kids and young people in 119 countries, that it has occurred this year. Million of families in America have been enrolled at homeschooling with

more than 1.1 million kids. Here in Mexico where the Secretary of Public Education (SEP) has extended the holiday period from March 23 to April 17 2020.

According to World Economic Forum, around 60% of the world population have access to internet. Generating that many institutions seek provisional solutions to this crisis, such as the Mexican educative system, outside private schools or private University, public school didn't have the online learning. Digital divide continue expanding as students in vulnerable sectors keep lag behind in their learning.

### ***3.2 Students through the pandemic***

In almost all the world, a big amount of students have been affected in so many ways. The cancellation of face to face classes and now they should take online learning, a bad organization and not enough time has generated lots of difficulties and it has increased all the process of exclusion and migration. UNESCO said that the world hasn't ready for an educational disruption like this, suddenly schools and Universities around the world should close their doors, thinking quickly of solutions for an online learning and long distance education and continue with the education.

In this global emergency context, Latin America is not an exception, barely 1 of 2 homes has full internet service, without emergency plans to face the change from face- to face model to a distance education model, this has impacted all the people who are involved at high education (Maneiro, 2020).

Marion Lloyd present a specific information about Mexico, in the Latin America context.

In both situations, Mexico has a bad reputation. On 2016, Mexico ranked at the 87<sup>a</sup> place in the world and the 8<sup>a</sup> place in Latin America at the access of ICT, behind Uruguay, Argentina, Chile, Costa Rica, Brazil, Colombia and Venezuela, in this sequence, according to indicators of the international Telecommunication Union (UTI), based in Switzerland. Also exist a big digital opening inside the country, only 45% of the Mexicans count with a computer and 53% count with internet access in their home, according with Nacional polls about disponibility and Information Technology use at home (ENDUTIH), 2018. As expected, this access is not distributed equality, only 73% of the urban population has an internet access, compared with 40% of rural population. Even more worrying, only 4% of the rural residents count with internet in their home. (Lloyd, 2020, p.6)

And emphasizes that in the high education case, exist strong inequalities according their socioeconomic condition of the students. For those who are from families with deficit of income, 55% doesn't count with internet nor computer in their home, meanwhile for those with a big amount of income, the number barely are up of 2%, according with National polls about availability and Information technology use at home (ENDUTIH), 2018, it means, that there exist a digital divide of 25 to 1. On average, 18% of University students public or private both of them don't have an internet access. For the medium level, however, it's more significant the difference, 81% of the most poor people don't have internet nor computer, compared with 3% of the richest or average, 40% don't have access of the ICT in their home (Lloyd, 2020, p.6)

In the conditions described between the decisions that students have been taken all around the world, some of them have to cancel their scholarship and other kind of support, this was a need of leave the school, such as a postpone or cancel plans of studies outside the country (QS, 2020, p.8).

According UNESCO students are the ones who has been more affected on their face - to face activities, leaving IES with learning impact. The follow graphic allow to compare results between Iberoamerica and the rest of the world

*The main difficulties of higher education students during the pandemic according to UNESCO*

*Fuente: Encuesta de la UNESCO a las cátedras UNITWIN (2020).*

In Iberoamerica, however, the order of concerns is somewhat different since UNESCO chairs place, above the others, only three priorities: internet connectivity,

financial issues and schedule problems, that maybe can associate in some way with learning and knowledge from school that do not applied the self- learning.

This inequality is reflected in the high dropout rates and not continue with the higher education: on average, only half of the people between 25 and 29 years who were enrolled did not complete their studies, either due they dropping out or because they are still studying. Of those who drop out, half of them did it at the first year (Ferreyra, Avitabile, Botero Álvarez, Haimovich Paz, & Urzúa, 2017).

It's difficult, on the other hand, to anticipate the multiple differential effects that are felt in different profiles of students, regardless of their socioeconomic background, starting with gender.

### **3.3 Supports from the University of Guadalajara, Mexico gives support to students**

The University of Guadalajara launches a program named "from Home", this program lend computers to their students.

"32% of the students at the University of Guadalajara do not have a computer, therefore, we must be sensitive with our students. To reduce this gap, an equipment loan program will be launched for high school students and University centers, so our students can follow up on their training from home" said Rector General, Ricardo Villanueva Lomelí. Gaceta UDG (2020)

With this program, they give 500 iPad and a thousand laptops will be distributed and schools with the greatest number of students without access to a computer will be privileged, both from regional and thematic university centers as well as from Sistema de Educación Media Superior (SEMS) y UDGVirtual.

*Foto: José Díaz*

Laptops will be distribute as follows: 520 computers for the Guadalajara Metropolitan Area (AMG) campuses and 480 for the regional high school.

In order to applu and find out if you can benefit from this program, go to: <http://www.gaceta.udg.mx/desde-casa/>, to consult the institutional directory of the areas responsible for loans in your educational establishment.

The call will be available until July 20, 2020.

### ICT's Technologie- Social impact

During their introduction and establishment, ICT have a double effect, since they transform organizations and people and cause the distancing of those who cannot or do not want to use them.

Among the imbalances produced by technological renovation, we can identify the following points:

Social gap: caused by lack of training during youth or low economic capacity.

Accessibility gap: caused by a lower sensory or cognitive capacity.

Technology gap: outdated caused by the lack of interest in what is new.

Technological bifurcation point: age in which it is considered unnecessary to resort to new technologies.

With this information can be observed what could be classified as a series of opportunities and threats, both general and specific, which are indicated below in the following table, which was obtained from the following address.

Social opportunities and threats

OPORTUNIDADES Y AMENAZAS SOCIALES
<b>Son oportunidades generales</b> <ul style="list-style-type: none"><li>• El aumento cuantitativo de la formación tecnológica a todos los niveles de la población.</li><li>• La creación de iniciativas empresariales en el mercado de los servicios sociales basados en tecnologías de la información.</li><li>• La capacidad de investigación y desarrollo local en áreas industriales.</li><li>• Desarrollar una comunidad tecnológica en TIC, que incluya acciones simultáneas sobre las tres brechas.</li></ul>
<b>Son amenazas generales</b> <ul style="list-style-type: none"><li>• La lentitud en la adopción de nuevas políticas educativas innovadoras y de formación masiva a la población en y con TIC.</li><li>• La consideración de la brecha de accesibilidad como único problema.</li><li>• La alta dependencia tecnológica en TIC y sus costes.</li><li>• La evolución tecnológica rápida y el aumento de la edad de la población.</li></ul>
<b>Oportunidades específicas</b> <ul style="list-style-type: none"><li>• Personalización del uso de la tecnología. Avances en accesibilidad, movilidad, seguridad.</li><li>• Aumento de las ayudas técnicas (brecha accesibilidad) y diseño universal (WAI).</li><li>• Desarrollo de tecnologías que se adecúan al entorno y reducción del tamaño de los dispositivos.</li><li>• Aumento de los modos de comunicación persona-ordenador.</li><li>• Entorno multilingüe y lenguaje natural.</li></ul>
<b>Amenazas específicas</b> <ul style="list-style-type: none"><li>• Aumento de la dependencia de otros por la brecha tecnológica (falta de sensibilización).</li><li>• Formación centrada sólo en el uso básico de la tecnología (falta de competencias personales y profesionales en TIC).</li><li>• Diseño tecnológico ausente de los colectivos afectados por las brechas citadas.</li><li>• Separación de colectivos sociales (tecnificados/no tecnificados).</li></ul>

## 4 Analysis of Results

### 4.1 Methodology

Populations of 300 students were asking about their hybrid education. It will be quantitative and qualitative, using the confiability of 90 and 95% to obtain the results. And we are going to use questioner with Likert scale.

Section	Items	Concept to size
A	6	General data
B	6	Class hybrids
C	6	Recursos, Plataformas (classroom, Videos, Moodle, Meet y Zoom, Otros)
D	6	Resultados de examen de egresos

Note: Measuring instrument. Own elaboration.

We used Likert scale with five options which they were list to 1 to 5, 1 is lower value and 5 higher value.

#### Statistical reliability

Alfa de Cronbach	No. items
.812	30

Nota: Alfa de Cronbach.

Kaiser reports a KMO evaluation scale:

0,90 < KMO <= 1	Very good
0,80 < KMO <= 0,90	Satisfactory
0,70 < KMO <= 0,80	Media
0,60 < KMO <= 0,70	Moderate
0,50 < KMO <= 0,60	Bad
KMO <= 0,50	Unacceptable

Where:

n= sample size , 250 students

Z= Confidence Level (95%)

P= Probability that the event occurs (50%)

Q= Probability that the event does not occurs (50%)

E= Acceptable Error (5%)

Degree modalities at University of Guadalajara

- Global theoretical exam. ...
- General Professional Certification Exam (CENEVAL) ...
- Professional training exam. ...
- Reply verbal or in writing. ...
- Educational package.
- By Diploma

The first two, academic excellence and titulation by average, the students have to do the general profesional certification exam (CENEVAL), this exam help the University of Guadalajara being ranked as one of the best University together with other National or International University.

	<b>F</b>	<b>Sig</b>
1. - Which platforms were most suitable for hybrid education at the University of Guadalajara, Mexico in CUCEA in the department of International business and Marketing?	<b>3.21</b>	<b>0.03</b>
2. - Is the use of moodle safer for hybrid education with the application of ICT? What was the learning of the two semesters compared to 2020A and 2020B with hybrid education?	<b>2.121</b>	<b>.035</b>
3. - Teachers who compare can be given with their hybrid education and ICT's?		

In order to continue with this research, an informative development will continue citing the documentation and research that complete all our problems statement, since it is necessary to know why this issue is a problema located within the population mentioned in the point of the approach of the problem and obtain as much knowledge as posible regarding this problem, which affects the development of ICT. The research method will be mixed, quantitative and qualitative research. Use of particular statements and results of observation, experimental and the use of a checklist.

In the qualitative part with the use of the interview instrument and observation to obtain all the data from the research, in the quantitative part, the measurement tool is the survey.

## **4.2 Results**

The degress in the 2020 A calendar were 10% for contingency and 2020B 25%. But where it was the increase for qualification was the modality by diploma that is just take 6 modules and they are virtual groups of 15 students increased to 40 or 45 students.

The response of the students is to be able to understand and confirm their knowledge that they took courses with the virtuality and hybrid modality.

The results of our hypotheses.

## **5 Conclusions**

Determine curriculum improvements and ICT use. To face the changing that the world is facing in the education changes and we could be more competitive with our students with this pandemic and then we could be more prepared to keep going with the hybrid education for the internalization.

## **6 Proposal for future research**

Mexico needs to solve their connectivity, the acceptance of long distance learning and not only face to face learning, but being more competitive and to get better results. We are going to do another comparative research this year 2021A- 2021B to know the result of the new students that haven't being in a classroom and waiting for the graduated result

This results will help us to know which levee the University of Guadalajara are at National and International level, this for the academic exchanges, on high grade like University, master or PhD grade.

### **Abstract**

With the advent of the Digital Transformation, Healthcare Systems have switched from paper to electronic health records (EMR). However, there are few critical issues related to data governance (e.g., transparency of data, traceability, immutability, privacy and security) that need to be addressed in the upcoming years. Blockchain (BT) is a decentralized digital ledger and an innovative technology with the potential to address such issues.

A pivotal role when implementing a blockchain-based solution, in healthcare as in other fields, is played by the stakeholders involved in the digitalization process, and in their

respective readiness, that can be defined as the availability and capacity of the various stakeholders to adopt the new technology, both individually and collectively.

Readiness represents a factor that affects the correct implementation of blockchain-based solutions and is commonly declined in the literature by means of different dimensions: motivational readiness, engagement readiness, technological readiness and structural readiness.

Readiness is particularly important for those stakeholders who are nodes of the blockchain network, as they have the fundamental role of keeping and exchanging the information necessary for its operations.

However, in the literature we have not encountered any work analyzing the differences between stakeholders that are nodes and those that are not-nodes of the BT network, not only in terms of type but also in readiness.

This work aims at identifying what is the difference between the readiness dimensions of stakeholder-nodes respects stakeholders-non-nodes in BT-based projects applied to EMR and how readiness impacts blockchain-based projects, especially when it concerns the stakeholders that are nodes of the BT network and those that are not.

The chosen methodology is the multiple case studies; three different projects have been selected that use BT in different ways to manage EMRs.

Through semi-structured interviews, it was possible to identify the stakeholders interested in these projects, determine which of these represent nodes of the network and which non-nodes, and identify the different dimensions of readiness that characterize them.

**Keywords** – Blockchain, Electronic Medical Records, Healthcare Organizations, Digitalization

**Paper type** – Academic Research Paper

## 1 Introduction

Digital technologies represent a possible tool to achieve a better healthcare quality (EUR-Lex, 2020). The results of "Digital Transformation: Shaping the future of European healthcare" research performed by the Deloitte Center for Health Solutions (2020), highlighted that the most used technologies in healthcare are connected to the electronic medical record (97% in the Netherlands, 74% in Portugal, 69% in Italy) and the electronic prescription systems (97% in the Netherlands, 13% in Germany, 67% in Italy). Data is, in fact, the core element of this digital transition, which revolutionized economy, society, and health [4]. Through digitalization, healthcare organizations can integrate and improve care, increase quality and make data flow more accessible.

Although there are significant differences among the requirements and objectives of the different digital health systems, there are three main criticalities characterizing most of them.

First, the health structures often use non-homogeneous application architectures, even within their operating units. Moreover, the data extracted from different devices are often heterogeneous and hard to integrate with each other automatically. In this context, obtaining a complete picture of the complete health history of a patient is challenging, and the resulting fragmentation generates inefficient coordination of care, lack of interoperability and potential lack of essential information in case of emergency (Yaeger *et al.*, 2019; Zhang *et al.*, 2018).

Secondly, patient information is generally contained in electronic health records, mainly organized within centralized systems and, for that reason, vulnerable to a single point of failure and information loss, due to natural disasters or information thefts following cyber-attacks (Yaqoob *et al.*, 2021). It's worth recalling that last September, ransomware attack caused a network failure at the University Hospital of Düsseldorf (UKD), which also caused the death of one patient (Ciampanu, 2020).

Finally, current data management systems cannot ensure transparency, reliable traceability, immutability, audit, privacy, and security when managing EMR (Yue *et al.*, 2016).

Blockchain Technology (BT) has the potential to address those issues (Chen *et al.*, 2019; Gordon, 2019; McGhin *et al.*, 2019; Farouk *et al.*, 2019). It is an extremely innovative technology, able to aid the simplification of health data management operations: on the one hand, it allows unprecedented efficiency and reliability in data management (Islam *et al.*, 2016; Chukwu, 2020; Syed *et al.*, 2019; Esposito *et al.*, 2018), on the other, it offers a wide range of important integrated functions, such as data access flexibility, security, privacy, decentralized storage, transparency, immutability, authentication, disintermediation, verifiability, programmability, interconnection (Omar *et al.*, 2018; Hasselgren *et al.*, 2020).

BT is, indeed, a decentralized digital ledger that offers the opportunity to record and share information (Hussien *et al.*, 2019). This data is held on the network through a series of nodes. Any entity connected to the blockchain can be classified as a node. Nodes are a critical component of the infrastructure of a blockchain because they act as further validation for the ledger, allow anyone to transparently view transactions/data conducted or held on the network and their

connection is described by blockchain architecture (Hussien *et al.*, 2019). If the nodes involved in blockchain are already known to the network, then the blockchain is referred to as permissioned, such as Hyperledger Fabric (Androulaki, 2018). When a system is open to the public, any individual or organizational node can be a member of the network; hence, this blockchain is referred to as public, such as Ethereum (Founder *et al.*, 2018) and bitcoin (Nakamoto., 2008; Hussien *et al.*, 2019).

Because of these characteristics, BT seems to be the leading solution to address the healthcare critical issues described above. Nevertheless, it is worth noting that the introduction of new and emerging technologies in any sector can give rise to some problems and challenges (Khan *et al.*, 2021).

The literature unison confirms that blockchain requires a strong synergy among the stakeholders (Lee *et al.*, 2012): not only clinical staff, patients, management, but also suppliers and BT experts, need to be put in place. Therefore, when implementing a BT project, it is essential to assess the stakeholders' readiness, i.e., the availability and capacity of the various stakeholders concerning the adoption of the new technology, both individually and collectively (Savage *et al.*, 2010). Specifically, the literature shows that four dimensions of stakeholders' readiness play a pivotal role: motivational readiness, engagement readiness, technological readiness and structural readiness (Balasubramanian *et al.*, 2021).

However, to our best knowledge, the literature has neglected one important difference between stakeholders: all nodes can be stakeholders, but not all stakeholders are nodes. This means that not each readiness dimension may be as important for every stakeholder and hence that not necessarily all the stakeholders should score high whatever the readiness dimension is analysed. To put it differently, for implementing a BT project, it is important to distinguish if there are differences between nodes stakeholders and not-nodes stakeholders in terms of readiness dimensions. This is indeed our paper's objective, which we deem extremely important in a BT project, in order to avoid assessing readiness dimensions whose role is not critical for a specific type of stakeholder. On this regard, the research questions underlying this research are the following:

1. What is the difference between the readiness dimensions between stakeholders-nodes and stakeholders-non-nodes in BT-based projects applied to EMR?

2. How does nodes-stakeholders' readiness and non-nodes stakeholders' readiness affect the implementation of BT-based projects applied to EMR?

## 2 Background

The fundamental basis of BT is the nodes that constitute its network and that orchestrate all the information necessary for its operation. In the literature, the nodes of the projects implemented with BT are usually referred to as stakeholders or as interested and involved actors on various levels. The distinction between node and stakeholder is not clear and thoroughly defined; very often, it is not even considered that if it is true that all the nodes of the BT network are stakeholders, not all stakeholders are nodes.

Previous studies in the healthcare field have highlighted a plurality of relevant stakeholders for implementing BT-based solutions. For instance, patients (Patel, 2019; Siyal *et al.*, 2019, Yoon, 2019, Khatoon, 2020; Tandon *et al.*, 2020) and Governments (Bell *et al.*, 2019; Dhagana *et al.*, 2019) have sometimes been included as stakeholders. Moreover, business entities (Radanovic and Likic, 2018), regulatory bodies (Nugent *et al.*, 2016), and service providers (Kuo *et al.*, 2017) have been included as actors with a stake in the BT system development.

Hence, the literature, while recognising the diversity in terms of type and interests between the involved actors, identifies a wide spectrum of actors as stakeholders, without taking into account if they are nodes or non-nodes of the blockchain network. For example, in a patient-centric project aimed at improving clinical record management, both the patient – i.e., the owner of clinical data - and hospitals – i.e., data managers - are undoubtedly stakeholders and nodes of the blockchain network. Conversely, the Government, even if recognisable as stakeholder aiming at both ensuring the privacy of its citizens and improving the efficiency of the process, is not necessarily a node in the network.

Savage (2010) and many others explain that when a BT project is implemented, the stakeholders' readiness, i.e., their availability and capacity of adopting a new technology, is important; and it is important in all its four dimensions: motivational, engagement, technological and structural (Balasubramanian *et al.*, 2021; Li *et al.*, 2012). The achievement level of each of the above different dimensions of readiness is an important element that impacts the BT implementation (Balasubramanian *et al.*, 2021).

Motivational readiness is necessary to appropriately address the changes concerning an existing service or circumstance - for instance, in clinical data management, the need to overcome problems related to the quality of service or privacy. Motivational readiness presents strong and different relationships with the stakeholders involved; end-users who receive assistance below expectations, regulatory bodies interested in providing an adequate service to their citizens, corporate entities that, by offering assistance, face the inefficiency of the health system daily.

Engagement readiness refers to the knowledge of new solutions and the explicit recognition of their benefits and potential challenges. For blockchain technologies, this includes knowing how to achieve results, the potential risks to current systems, the potential benefits, the difficulties associated with development costs, and the risks of failure.

Technological readiness is the individual or organizational predisposition to embrace new technologies. Factors contributing to this type of engagement include, for example, the availability and compatibility of existing hardware, software, networks, applications, and other information and communication technology (ICT) resources that facilitate the new technology. Technological readiness regards all the stakeholders, as it refers to the propensity to welcome new technologies and make integration with previous ones possible.

Structural readiness refers to the availability of non-technical resources - financial and human - to be invested in adopting new processes or technologies. Indeed, implementing BT requires valuable resources, such as time, money, and personnel. For the implementation of blockchain, a high level of structural readiness is essential both for government bodies and for the health and blockchain service providers who invest in these projects, but also for end-users, as consumers, regarding the availability and ability to use computers, smartphones and the Internet for daily activities.

We are adamant to claim that the above difference between node and non-node stakeholders within the network play a role when determining the factors that influence the possibility of implementing BT, as in the specific case of readiness in all its four dimensions.

The relationship between readiness and types of stakeholders involved in the implementation of BT-based projects - if nodes or not-nodes - is important to properly assess to what extent the single stakeholder is ready for adopting a new technology. However, the scientific debate does not provide indications. More

specifically, we encountered only three studies about blockchain readiness assessment (Ozturan *et al.*, 2019; Vlachos *et al.*, 2019; Balasubramanian *et al.*, 2021), and only one of them (Balasubramanian *et al.*, 2021) involved healthcare. Furthermore, to the best of our knowledge, no work on readiness assessment has been published that considers the difference between the stakeholders in terms of node or non-node of the blockchain network.

### **3 Methodology**

#### **3.1 Case studies**

We present here a multiple case study: as blockchain-based solutions in healthcare are a new phenomenon and there is a lack of quantitative data, we have chosen a qualitative approach.

We used the database provided by the Blockchain & Distributed Ledger Observatory of the Politecnico di Milano, which mapped the reality of the blockchain worldwide, to identify the state of the art of blockchain initiatives in the healthcare sector and to select the case studies to be analyzed in detail.

Starting from the database containing all the projects, we applied these selection criteria: the level of maturity of the project and their relationship with the medical record, such that we would include only cases with a close relationship with the medical record. The information availability and the general characteristics of the case contributed to the inclusion in the selected group.

The selected case studies are the following:

1. SAFE– [2020; Operating]
2. Medicalchain with the Groves Medical Group - [2018; Operating]
3. Hypertrust X-Chain - [2018; PoC]
4. Toronto Hospital Project - [2020; PoC]
5. IBM Canada project - [2019; PoC]

Following a detailed projects analysis and an initial contact with their respective representatives, aimed at verifying their availability to participate in the interviews, we selected SAFE, MedicalChain and HyperTrust X-Chain.

SAFE was born from the “MedTech Accelerator”, the flagship program of Mayo Clinic, and Arizona State University Alliance for Health Care. Its initial goal was to diagnose and monitor COVID-19, sexually transmitted diseases and some common ailments, such as flu.

The platform, currently used for COVID-19, connects patients, doctors and test providers through HealthCheck, an advanced smartphone and desktop application, which also allows verification of vaccination status. To ensure trust between all stakeholders and independently verify the accuracy of the information reported while keeping privacy intact, SAFE has relied on Hedera Hashgraph, a distributed ledger technology evolving from blockchain, which offers the same benefits as BT, but without its limits. The app includes voice / video telemedicine, services to allow the review, almost in real-time, of diagnostic tests and the option to request tests through interfaces / partnerships with Quest, LabCorp, and Mayo Clinic Labs and ePrescribing, through SureScripts.

Medicalchain is a platform, built in 2018, that allows the exchange and the use of medical data in a safe and fast way, without compromising the privacy of patients, thanks to asymmetric encryption. Healthcare professionals, doctors, hospitals, laboratories, pharmacists, and insurance companies can request permission to access and interact with medical records. Each interaction is verifiable, transparent, and secure, and recorded as a distributed ledger transaction. The platform is based on the Hyperledger Fabric architecture and, through permissions, allows different access levels, with the patients directly controlling who can access to which records and for how long. A smart contract is activated on this platform, which those entitled can allow third parties (e.g., doctors or other health professionals) to remotely access their medical reports through. Access can be granted in a limited form to specific files. Doctors can record, as ledger transitions, notes, scans, and lab results, and, likewise, pharmacists can add medications provided. Medicalchain also offers an innovative way to connect researchers and patients by sharing their data (anonymized), rewarding patients with personalized incentives (MEDTOKEN).

Eventually, with Hypertrust X-Chain, the CAMELOT Consulting Group offers a blockchain-based, patient-centered solution, particularly suitable for personalized treatments, which many stakeholders are involved in, such as in the case of self-transplant therapies. Hypertrust X-Chain orchestrates a distributed manufacturing process using a series of smart contracts, which act on a custom workflow model, stored on the ledger.

The system provides an end-to-end solution to automate, streamline and secure the supply chain for customized treatments, and inform interested parties about upcoming auctions. The system can be easily configured to manage the supply chain steps for autologous cell therapies such as patient enrolment,

apheresis, and treatment appointments planning and monitoring, hospital pick-up appointments planning and monitoring, among others. Hypertrust X-Chain enables safe, efficient, and transparent workflow management for the entire autologous cell therapy process, with far-reaching benefits for pharmaceutical companies and all other stakeholders in the supply and data chain.

The research protocol was drawn up in a semi-structured way, in order to allow the interviewees to speak freely about their projects, stimulate thoughts and opinions on the topics related to the study.

### 3.2 Cross-case analysis

The three case studies and the analysis of the literature allowed us to categorize the main actors involved in blockchain-based projects into four broad categories: governments and regulatory bodies, health service providers (hospitals, health professionals, pharmaceutical companies, laboratories, etc.), blockchain-based solution providers, and end-users.

The case studies confirmed that not all stakeholders are nodes. In fact, all three interviewees identified the same stakeholders, but the substantial difference between the three projects is to be found in the number and type of nodes that make up the BT network; in SAFE, the network's nodes are mainly represented by patients and doctors, in MedicalChain, hospitals are included as well, while in Hypertrust, the network becomes even more extensive, incorporating a series of further actors that concern, for example, the drug supply chain (Table 1).

Table 1: Stakeholder vs Node

MAIN ACTORS		CASE STUDIES					
		SAFE		MedicalChain		Hypertrust	
		Non-nodes stakeholder	Node stakeholder	Non-nodes stakeholder	Node stakeholder	Non-nodes stakeholder	Node stakeholder
Governments and regulatory bodies		✓		✓		✓	
Health service providers	Hospitals	✓		✓	✓	✓	✓
	Doctors	✓	✓	✓	✓	✓	✓
	More	✓		✓		✓	✓

Blockchain-based solution providers		✓		✓		✓	
End-users	Patients	✓	✓	✓	✓	✓	✓

The interviews highlighted the differences between the readiness dimensions relating to stakeholders, both nodes and non-nodes, of each case considered (Table 2).

End-users (patients) are nodes in all three cases and they all agree in assigning greater importance to their motivational readiness, because the drive for change involves the realization of problems pertaining to poor service or the violation of patient privacy.

Regarding health service providers, doctors are nodes for all three cases, hospitals are nodes only for Medicalchain and for HyperTrust, and other entities - such as pharmaceutical companies and transport service provider- are nodes only for HyperTrust. As for doctors, hospitals, and other entities, the motivational readiness and the structural readiness are considered essential; having the awareness of the critical issues related to data management becomes necessary to explore the possibility of using BT as well as expressing any fears or concerns about the use of the technology.

As for the non-node stakeholders identified by all three cases, SAFE and Medicalchain agree on the importance of engagement readiness for the governments and regulatory bodies while, SAFE and Hypertrust agree on technological readiness relevance for the BT- based solution providers, and the importance of structural readiness for both.

The importance of governments' readiness for involvement is related to knowledge, awareness of new initiatives, and a clear recognition of their benefits and potential challenges that drive regulators to change legal frameworks. Structural readiness refers to the availability of financial and human resources that governments invest in the adoption of new processes or technologies.

Regarding BT solution providers, the importance of technological readiness is linked to the availability, ability, and deep-in knowledge of existing hardware, software, networks, applications, and other information and

communications technology (ICT) resources and BT. Structural readiness, on the other hand, is linked to the availability of resources that would make it easier to implement BT.

Table 5 Readiness

CASE STUDY	STAKEHOLDERS AS NODES																											
	Governments and regulatory bodies				Health service providers						End-users				Blockchain-based solution providers													
					Hospitals		Doctors		More		Patients																	
SAFE							✓				✓																	
Medicalchain					✓		✓				✓																	
HyperTrust					✓		✓		✓		✓																	
CASE STUDY	READINESS																											
	M	R	E	R	S	R	T	M	R	E	R	S	R	T	M	R	E	R	S	R	T	M	R	E	R	S	R	T
SAFE			✓		✓							✓		✓												✓		✓
Medicalchain			✓		✓			✓				✓		✓						✓						✓		✓
HyperTrust							✓				✓		✓		✓				✓								✓	✓

The case studies have, therefore, highlighted that the assessment of readiness (with a different specific weight depending on the type of stakeholder and the

type of readiness) of both nodes and non-nodes is an essential variable for the implementation of blockchain.

On the contrary, only the stakeholders who are also nodes play a fundamental role in technological choice (Table 3). In fact, the technological choice depends on the ability of the nodes to send and validate transactions. If all nodes participating in the network can do this, a permissionless platform must be used, as in the case of SAFE, otherwise, if authorization is required to execute a transaction, a permissioned platform is used, as in the cases of Medicalchain and HyperTrust X-Chain.

Tabel 3 Technological Choice

Project name	Platform name	Permissioned/ Permissionless	Private/ Public
SAFE	Hedera Hashgraph	Permissionless	Public
MedicalChain	Hyperledger Fabric	Permissioned	Private
Hypertrust	Hypertrust X-Chain (supported BT: Hyperledger Fabric, Multichain, Quorum, Ethereum (private networks) and Hyperledger Indy)	Permissioned	Private

#### 4 Discussion and conclusions

The goal of this study was to fill a gap in the literature related to the weight that stakeholders, nodes and non-nodes, have in the implementation of BT and the importance of their respective readiness.

We have then shown that the importance of readiness for the implementation of BT projects was confirmed by our qualitative analysis. Using blockchain for secure data access and sharing is effective and reasonable if all parties involved in the process use it; indeed, BT is not owned by a single independent entity and all stakeholders must be part of the chain with a defined role.

The case studies revealed the existing relationship between each stakeholder, node or not-nodes, and between each type of readiness. This step is essential

because it clarifies what factors need to be considered when implementing such solution and how stakeholders could facilitate or hinder the building of BT-based projects.

In this paper, it was also discussed the fundamental importance of nodes for technological choice, and the case studies clarify that from the SAFE project to Hypertrust, there is an increase in the complexity of the network in terms of actors involved, data exchange, and BT functionality. On this imagined scale, one can think of placing SAFE at a low level of maturity of technology adoption, Medicalchain at a medium level, and Hypertrust at a higher level (Figure 4).

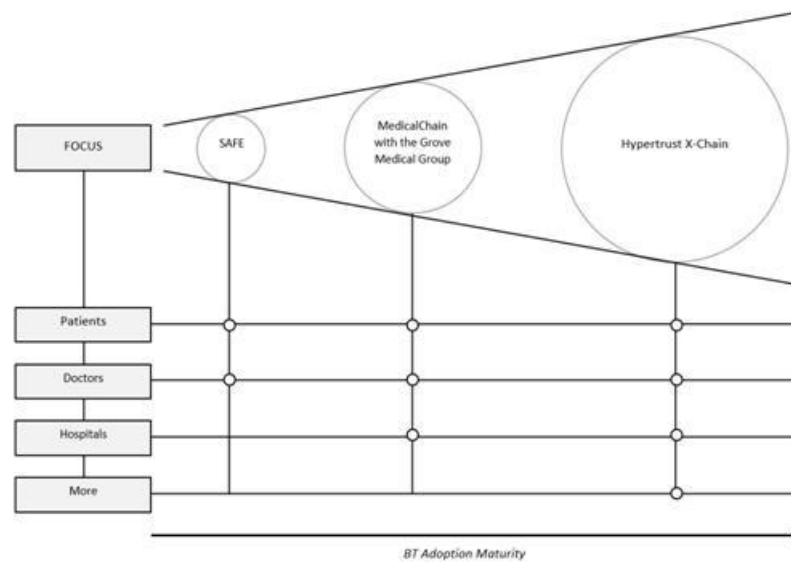

Figure 4 Adoption Maturity

However, a blockchain-based solution can evolve over time, as a consequence of the number and the type of the nodes joining the network, of stakeholders' need, and of the evolution of the external context. Taken together, our study shows that decisions about the BT form need to be taken not only during the startup phase of implementation, but also along the actual implementation and evaluation phases of the project.

Hence, it can be useful:

- to identify, *a priori*, the best solution for starting the implementation;

- to verify, *in itinere*, whether the initial form is still adequate or, according to the evolution, it should be modified;
- to evaluate, *a posteriori*, whether the chosen mode is adequate to the needs and characteristics of the collaboration.

It can also be useful for researchers and academics the *a posteriori* analysis because it may stimulate organizational learning within healthcare organizations and a better understanding of the complex phenomenon of blockchain-based solutions.

The analysis described in this research study is qualitative. We expect that with the increasing popularity and maturity of BT, novel data will be available for quantitative studies and further research should increase the rationality and the objectivity of our study.

For instance, during the selection of the case studies, two other cases were identified which are in the operational stage, as far as we know:

- The UAE Ministry of Health launches the Blockchain platform for medical data
- The HHS obtains ATO for a blockchain-based acquisition system.

It could be interesting both to broaden the investigation, analyzing these cases listed above, and gather more information with other interviews from the cases analyzed in this study.

### **Abstract**

The past decade has witnessed a surge of research interest in social entrepreneurship organizations (SEOs). This has resulted in important insights concerning the role of SEOs in fostering social challenges. The crisis of both public and private profit-driven models meet the arising of new initiatives designed to meet the minor and often abandoned cultural heritage consumption need. Drawing on the domain of SEOs and social bricolage framework, these initiatives are able to pursuing the social and the economic mission together and not in a sequential way. This paper aims to analyse how SEOs that use strategies of social bricolage can improve the development and diffusion of social innovation. In this first phase of our research we carried out a comparative case study of fifteen cultural SEOs in the South of Italy. First results show that SEOs in the domain of minor cultural heritage adopt an innovative business model and unravel organizational dimensions falling into the social bricolage. The relation between social bricolage dimensions and social business model criteria produces outcomes in which social innovation can be expressed. Our study enhances current understanding of the social dimensions of business model involved in social innovation production of cultural SEOs.

This research aims to be a benchmark of the social innovation initiatives in the field of minor cultural heritage management.

**Keywords** – social bricolage, social business model, minor cultural heritage, uncertain contexts, social innovation

**Paper type** – Academic Research Paper

## 1 Introduction

Social entrepreneurship is one of the most discussed issue in management literature (Dacin, Dacin & Tracey 2011; Mair and Martì 2009, Zahara et al. 2009; Di Domenico, Haugh & Tracey 2010; Janssen, Fayolle & Wuillaume 2018). As well known and established in the literature (e.g. Mair and Martí 2006; Marshall 2011; Van de Ven et al. 2007; Zahra et al. 2009; Seelos et al. 2011; Mair, Battilana & Cardenas 2012) social entrepreneurship is an umbrella-term that encompasses a variety of organizations pursuing innovations and aiming at diverse social and environmental challenges. Social entrepreneurship is characterized not exclusively by the pursuit of economic goals but also by the pursuit of social and environmental objectives (Dees 1998; Mair, Battilana & Cardenas 2012). This has resulted in important insights concerning the role of social entrepreneurship organizations (SEOs) in fostering social challenges and in creatively and innovatively coping with resource-constrained environments.

SEOs have been identified as a form of social entrepreneurship at community level, an alternative and/or a complement to the action of States, governments, and private actors to address unmet social needs and/or poverty-related social needs.

In the last two decades, several streams of studies have focused on SEOs. A first one have examined their role as significant organizational players in market economies, exploring their contextual and structural dimensions and the sustainability of their economic and social outcomes (Moss et al., 2011; Bacq & Janssen 2011; Zollo et al. 2016).

A second stream has analysed the hybrid forms of SEOs to be innovative (Austin, Stevenson & Wei-Skillern, 2006; Zollo et al. 2016; Zollo et al. 2018). The hybridization of SEOs is basically anchored in the approach of bricolage (Lévi-Strauss, 1967; Janssen, Fayolle & Wuillaume 2018; Davies & Doherty 2019; Ciambotti & Pedrini 2021) that represents a significant opportunity to address

emergent social needs and to offer inclusive services to the communities. Nicholls (2009) argues that the problem-solving attitude of social entrepreneurs, characterized by a continuous generation of innovations, particularly fits with the bricolage behavior. According to Janssen et al. (2018), SEOs and bricolage share important characteristics that make them very close one to another.

Bricolage in social entrepreneurship (also called entrepreneurial bricolage, e.g. Zollo et al. 2018) allows to identify unserved markets in need (Gundry et al. 2011; Bacq et al. 2015) where to develop new contents, to capture new opportunities (Baker & Nelson, 2005), to advance novel approaches, to attract and use relevant resources. Moreover, several scholars (Gundry et al. 2011; Linna 2013, Desa & Basu 2013; Desa & Koch 2014; Bacq et al. 2015) have highlighted that the ability of SEOs to develop social innovation and to produce social change directly depends on their bricolage strategies and bricoleurs' behavior. In particular, we draw on its social dimension and on the model of social bricolage, as "*ad hoc*" theorized by Di Domenico, Haugh & Tracey (2010).

A third important stream of managerial and entrepreneurial studies stress that SEOs' social bricolage engender their business models innovation (Zott & Amit, 2008; Guo et al., 2016; Servantie & Rispal, 2018) and the interdependence between social, cultural and economic outcomes to produce social innovation (Nicolopoulou et al. 2017; Gasparin et al. 2021).

So far, relatively little attention, however, has been paid to the business model innovation of SEOs that use social bricolage. Only a few studies have analyzed which business models SEOs can adopt to combine both economic and social mission by producing social innovation (Mair & Marti 2009; Gundry et al. 2011; Desa & Basu 2013; Gasparin et al. 2021), and how the social bricolage approach influences their business model in order to be sustainable (Desa & Basu 2013). Moreover these studies are mostly focused on BoP markets (Linna 2013; Angeli & Jaiswal 2016), and on transitional and developing economy contexts (Guo, Su & Ahlstrom 2016; Desa & Koch 2014; Gasparin et al. 2021).

This gap in the literature is surprising mainly because SEOs are at the forefront of social innovation, as they attempt to balance a distinct social mission with a strong market orientation (Desa & Kotha, 2006; Koch & Caradonna, 2006). SEOs produce social innovation by innovating content, structure, and governance of transactions and taking advantage of new opportunities, offering adapted products and services (Gundry et al., 2011). Therefore, defining a specific

approach to business model is crucial for sustaining the long-term growth of organizations that develop social innovation.

Drawing on the constructs of social bricolage, social innovation and innovative business model (Bhattacharyya et al. 2010; Yunus et al. 2010; Di Domenico et al. 2010; Zollo et al. 2017; Gasparin et al. 2021) we aim to fill this gap. Our study aims to analyse how SEOs that use strategies of social bricolage can improve the development and diffusion of social innovation.

Much of the previous research into the role of bricolage in SEOs has explored how this process is developed (Di Domenico, Haugh, & Tracey 2010), how it helps SEOs to achieve their social mission (Mair & Marti 2009), and how it affects the development of social innovation (Linna 2013). There are strong and recent calls in the literature for the understanding of the optimization of scarce resources in an innovative way in SEOs (Desa 2012; Desa & Basu 2013; Bacq et al. 2015; Molecke & Pinkse 2017) and their organizational models that make it possible to respond to an unsatisfied social need (Ciambotti & Pedrini 2019; Gasparin et al. 2021).

Moreover there is an interesting call for the application of these concepts in different socio-cultural contexts with multiple case studies and narrative analysis, especially in economically developed countries (Di Domenico, Haugh, & Tracey 2010; Janssen, Fayolle & Wuillame 2018).

In the present study, we draw on the special issue of *Entrepreneurship & Regional Development* of 2018, on the studies of Di Domenico, Haugh, & Tracey (2010), Zollo et al. (2018) and of Gasparin et al. (2021) for the analysis of business models of SEOs.

We see that SEOs using strategies of social bricolage are able to produce social innovation by adopting innovative social business model, in terms of organizational and entrepreneurial choices for social value creation and for emergent social challenges in complex contexts (Angeli & Jaswal 2016; Micheline 2012; Yunus et al. 2010).

We explore our aims by addressing a main research question: "How do SEOs adapt their business model to develop social innovation?"

Employing in-depth multiple comparative case studies and narrative analysis (Czarniawska 1997; 2004), we enhance current understanding of the social dimensions of SEOs and the innovative business model involved in social innovation production.

We focus on the minor cultural heritage in the South of Italy, because in last decade, SEOs play an increasing crucial role in the enhancing of minor and often abandoned (from both the State and private-market actors) cultural heritage sites, restoring them for the communities, generating economic and social value and employment opportunity (Consiglio & Riitano 2015). Moreover, cultural and Third Sector SEOs used to play a crucial role in the South of Italy marked by a socio-economic-structural weakness, intervening in severe situations of social distress being close to the most fragile people, using culture (Borzaga 2020; Consiglio & D'Isanto 2020). Their social infrastructures and their capacity for innovation demonstrated in facing moments of recession, economic difficulties and, currently, the pandemic are essential for the strengthening of communities and therefore for social and economic development.

Our study aims to contribute to the academic debate in several distinctive ways.

Building on these considerations, first, we contribute to the SEOs literature by exploring the main features of cultural SEOs and their social dimensions (Johnson et al., 2008; Yunus et al., 2010; Michelini, 2012).

Second, we extend and enrich studies on social bricolage (Di Domenico Haugh & Tracey 2010; Fisher 2012; Zollo, Pellegrini & Ciappei 2016; Molecke & Pinkse 2017; Zollo et al. 2018). We intend to offer new insights for the study of social bricolage and innovative social business model together for the development of social innovation (Gundry et al., 2011) and optimization of scarce resources in an innovative way. Moreover we further refined the studies by capturing the peculiar industry of cultural heritage in the South of Italy.

Third, by combining three crucial approaches: social bricolage, social innovation and social business model, we try to offer a novel strategic framework for the study of SEOs, where social and cultural goals, as well as the paths to market and economic outcomes, are equally prioritized by them to produce social innovation.

The remainder of this article is organized into four sections. The first section describes the background and framework connecting our three approaches. It analyzes SEOs and social bricolage behavior, examines the role of SEOs in the production of social innovation and develops the concepts of SEO's business model innovation in the literature. The second section introduces the research design and the study site, explaining the criteria for analysis, methodology and procedures for data collection. The third section discusses and compares the

cases and narratives, developing a strategic framework for SEOs in the management of minor cultural heritage. We conclude with a final section discussing contributions and conclusions. We acknowledge the limitations of our research which open up avenues for future studies in the area of SEOs, social innovation and business model innovation.

## **2 Background and framework**

### **2.1 SEOs and the entrepreneurial opportunity of social bricolage**

Social entrepreneurship signals the imperative to drive social change, and it is that potential payoff, with its lasting, transformational benefit to society, that sets the field and its practitioners apart (Martin & Osberg, 2007). Following the definition of Mair & Martí (2006, p. 37), social entrepreneurship is *"the process involving the innovative use and combination of resources to pursue opportunities to catalyze social change and/or address social needs"*.

In so doing, processes of social entrepreneurship often overcome established conventions: span sectorial boundaries (Austin et al., 2006), experiment with different ways of organizing (partnerships, alliances, and joint ventures) (Di Domenico et al., 2009; Seelos & Mair, 2007), and use a range of legal forms including for-profit, not-for-profit, and hybrid legal statuses (Dorado, 2006).

Building on recent literature, we follow the definition of social entrepreneurship, as a field of action involving different kinds of actors where individuals or groups use entrepreneurial tools to solve social challenges (Mair & Martí, 2006; Martin & Osberg, 2007; Zahra et al., 2009; Seelos et al., 2011; Mair, Battilana & Cardenas, 2012).

Yunus (2007) claims that social entrepreneurship is a broad concept about creating innovation measures that can help people in need. Dees et al. (2002, p. 5) have pointed out that *"social entrepreneurship is not about starting a business or becoming more commercial. It is about finding new and better ways to create social value"*.

In this domain, SEOs represent an innovative melting pot of social entrepreneurship combining two traditionally distinct models: on the one hand, a social welfare model that pursues its societal development mission, and on the other side a revenue generation model that pursues profit through commercial activities (Battilana et al., 2012). SEOs can adopt a for-profit or a non-profit legal

form in specific industries, such as, education, healthcare, young/women/migrants inclusion, cultural heritage and in the general field of Third Sector (Mair & Marti, 2006; Seelos & Mair, 2005; Leadbeater, 2007; Seelos et al. 2011; Mair, Battilana & Cardenas, 2012; Mintzberg and Azevedo, 2012). Following Lisetchi & Brancu (2014, p. 90), associations, foundations, cooperatives, social enterprises, mutual organizations and commercial enterprises with a social purpose (e.g. work integrating social enterprises), are "*outputs of the social entrepreneurship process*". According to the European Commission (2020), the concept of social enterprise has been refined over the last decades through relatively intense legislative activities designed to regulate this new type of SEOs.

The scarcity of resources accurately describes the environment in which SEOs evolve. Most SEOs face difficulty acquiring the resources they need to start and growth (Zahra et al., 2009; Austin et al., 2006). In social entrepreneurship literature, bricolage appears to be the dominant approach identified for understanding social entrepreneurship behaviours (Servantie & Rispal, 2018). Desa & Basu (2013) and Mair & Marti (2009) suggest that bricolage is appropriate in social entrepreneurship. Much of the previous research into the role of bricolage framework in SEOs explores how this process is developed (Di Domenico et al., 2010) and how it helps SEOs to achieve their social mission (Mair & Marti, 2009).

Bricolage in SEOs encompasses a set of actions driven by the pursuit of existing and often scarce resources that can be combined to create innovative and valuable solutions that bring positive social change to markets and communities (Gundry et al, 2011).

Building on previous works (Janssen et al., 2018; Desa & Basu, 2013; Mair & Marti, 2009; Baker & Nelson, 2005; Lévi-Strauss 1966), bricolage in SEOs could define as "the making do" with any resources "at hand" to provide innovative solutions for social needs that traditional organizations fail to address in an adequate way.

Indeed, within constrained environments, SEOs may engage in bricolage as a means to discover new and novel ways of solving social problems and meeting needs; access human and financial capital to implement the selected ideas; and remedy any strategic weaknesses that obstruct their pursuit of desired social improvements (Anthony et al., 2008).

In light of these assumption, bricolage has traditionally represented one of the most adopted option used by SEOs (Desa & Basu, 2013; Linna, 2013).

Starting from Di Domenico, Haugh and Tracey (2010), the literature recognizes the “social bricolage” as a concept in its own right and conceptually distinct from other forms of bricolage. The authors extended the constructs of bricolage to define social bricolage as a set of six processes. In addition to the traditional constructs of making do, refusal to be constrained by limitation, and improvisation, they identified three further processes in social entrepreneurship context namely:

1. social value creation, with skills development, social capital and community cohesion;
2. stakeholder participation, with governance structures and engagement in respond to social needs
3. persuasion, which describes the process of persuading other actors to leverage acquisition of new resources and support.

These further processes are closely related to the main dimensions of SEOs analysis. The conceptual framework of social bricolage in the context of SEOs combine to form a contextualized set of social action capabilities that can be leveraged by social entrepreneurs in their effort to create social value (Di Domenico et al., 2010).

Already in the previous literature, it is interesting to note that SEOs tend to adopt behaviors from social bricolage. Zahara et al. (2009) underline that three types of SEOs exist, that differ in how they address social need, how they acquire resources and how they recognize opportunities. The first type is called social bricoleur. Social bricoleurs have intimate knowledge about the local environment and the locally available resources to address small-scale local social needs. Their scope might be restricted, and they might not aim to scale up their ventures. They draw on local experiences and connections to the community. From a wider perspective, social bricoleurs share the common features of social entrepreneurs, namely skillful management of unexpected opportunities, spontaneous innovation, improvised risk, resources differently rearranged to social value creation (Zollo et al., 2017; Bacq & Janssen, 2011; Peredo & McLean, 2006).

Therefore (Di Domenico et al., 2010; Desa, 2012; Desa & Basu, 2013; Bacq et al., 2015; Zollo et al., 2017; Janssen et al., 2018), the concept of social bricolage is an entrepreneurial opportunity to address emergent social needs, in contexts characterized by scarcity of resource, high levels of uncertainty in economic

environments and the seasonality of activities (Langevang et al. 2012), such as that one of minor and abandoned cultural heritage.

Hence, social bricolage behaviors can be found in SEOs' organizational processes, especially in their early start-up stages, but according to Zollo et al. (2017) this approach does not guarantee in the long term the necessary efficiency and sustainability.

However, social bricolage is a suitable solution when adaptability, improvisation and resilience are more important than structural efficiency (Di Domenico et al., 2010). Hence, we stress the importance of the social bricolage processes because relational capacity, network implementation, spontaneous cooperative activities are the main features of the minor culturale heritage field where operating cultural SEOs. These social aspects of bricolage aims at social value creation.

As a consequence, recent scholars argue that the use of bricolage can affect the diffusion of social innovation (Gundry et al., 2011; Desa, 2012; Desa & Basu, 2013). In this sense, it is possible to highlight that the SEOs' use of social bricolage impact on their ability to produce social innovation.

## **2.2 SEOs and social innovation**

SEOs are closely linked to social innovation, however it is important to point out differences and similarities (Phills et al., 2008). The more critical research in social innovation points out that a gap has opened up between the classic social scientific theories of change, which also address social innovation, and the new social innovation analysis, in which the market economy represents an important framework for understanding the phenomenon, and in which social entrepreneurship is one of the principal tools for generating social innovation (Dacin et al., 2011).

Social innovation spans boundaries between different fields (Rao-Nicholson et al., 2017) with the aim of developing "*a novel solution to a social problem that is more effective, efficient, sustainable, or just than existing solutions and for which the value created accrues primarily to society as a whole rather than private individuals*" (Phills et al., 2008, p. 39). Social innovation can be products, services, production processes, technologies, principles, ideas, legislation, social movements, interventions, or a combination of these that address gaps generated by the State and the market failure of public goods (Phills et al., 2008, p. 39). The

goal of social innovation is to create social value beyond the capacity of the existing system (Adams & Hess, 2010) and must be a systemic change. This involves the interaction of social movements, law and regulations, data and infrastructures, business models and entirely new ways of thinking and doing things.

An important characteristic of social innovation is its capacity to involve in the generation of solutions different actors from all sectors and according to the social, economic, environmental, institutional, and cultural context where it takes place.

According to Mulgan (2007), a major difference between social innovation and social entrepreneurship is that *"whilst social innovation certainly occurs through social enterprise and social entrepreneurship it also happens in many other contexts. Conversely, although social entrepreneurship often involves innovation, only a small minority of social entrepreneurs create new models that can then be scaled up, and that process of scaling up often involves governments and larger businesses"*.

Following the European Union/Young Foundation (2010), these definitions aim at highlighting the main differences between the two concepts. Social entrepreneurship *"is used to describe the behaviors and attitudes of individuals involved in creating new ventures for social purposes, including the willingness to take risks and find creative ways of using underused assets"* (p. 15).

Social innovation is a much broader concept than social entrepreneurship, and as the European Union/ Young Foundation note, it will often encompass SEOs: *"... although it will often include one or both of these"* (p. 16).

From a literature overview, social innovation studies include the social processes of innovation itself, particularly those innovations which have a social purpose. It focuses on the process dimension of innovation, on how innovation and change take place, on how they are adopted and spread, and how they can be scaled-up, to address social problems. The social entrepreneurship perspective focuses on understanding the characteristics of individuals that create new solutions to solve social problems (or needs) and create social value.

Therefore, SEOs are seen as agents of social innovation in the society *"who help find solutions to social challenges, through creative and innovative products and ideas"* (Waasdorp & Ruijter, 2011, p. 72).

In summary, social innovation refers primarily to processes of system-building whilst social entrepreneurship is a way of understanding behaviors and

orientations of the individuals who lead that process (Cunha, Benneworth, & Oliveira, 2015).

Gundry et al. (2011) study the impact of social entrepreneurs' use of social bricolage on their ability to develop social innovation. SEOs are constrained to combine existing and limited resources in a creative way in order to tackle social problems (Gundry et al. 2011). In this perspective, bricolage allows developing novel approaches to attract and use relevant resources, identify markets in need and offer adapted products and services (Gundry et al. 2011). In this way, the ability of the social entrepreneurs to provide social innovative solutions directly depends on the extent to which they use bricolage (Gundry et al. 2011).

According to Zollo et al. (2017), recent scholars argue that entrepreneurial bricolage may be interpreted as the way modern entrepreneurs "catalyse" social innovation by effectively 1) combining available resources in an ingenious fashion and 2) entering new markets that are ignored by their competitors and seizing the latent profitable and attractive opportunities (see Desa & Basu, 2013; Kickul, Bacq & Garud, 2013; Bacq, Ofstein, Kickul & Gundry, 2015). In this sense, Zollo et al. (2017) assess that the "*ephemeral social entrepreneurship bricolage strategies*" emerge when SEOs look for sustainable solutions to emergent social problems (Johannisson & Olaison, 2007; Di Domenico et al., 2010; Desa, 2012) and resources mobilization (Bacq et al. 2015).

### **2.3 Business model innovation for SEOs**

SEOs must constantly cope with resource-constrained environment and to persist in designing sustainable business models to overcome these constraints (Linna, 2013).

SEOs pursue an innovation process of their business model to create a greater social value while achieving economic sustainability. This process requires SEOs to develop new knowledge resources to innovate their business model.

Several scholars have explored the business model innovation concept (e.g. Osterwalder and Pigneur, 2010; Yunus et al., 2010), in order to overcome limitations of the traditional frameworks in analyzing new forms of business where the social component is relevant. SEOs, as entrepreneurship organizations, need to define the three main elements of their business model (Zott and Amit, 2008; Osterwalder and Pigneur, 2010): 1) their value proposition that describe the value the company creates for its customers and partners; 2) their value

architecture that explains how they create and deliver products or services, and thus, how the value is generated; 3) their sustainable revenue model.

When coping with businesses endowed with strong social implications, Yunus et al. (2010) argued that business model should be characterized by a consistent view of how an organization generates revenues and profits. Indeed, there are some specific aspects of SEOs' business models (Dees et al., 2002; Seelos and Mair, 2005; Austin et al., 2006; Santos, 2009) that differ from business models of commercial entrepreneurs and business models of traditional non-profit organizations.

The SEOs value proposition is typically linked to address the core of a social need in order to creating a systemic change and providing a sustainable support (Seelos and Mair, 2005).

The SEOs value architecture often engages customers/beneficiaries and partners in the creation of products or services. SEOs build these relationships on shared objectives arising a bond of trust. This can serve two purposes. First, it is an innovative resource mobilization strategy that overcome restrictions caused by resource limitations. Second, the stakeholder participation is based on empowerment and co-creation process and develop a sense of responsibility, belonging and identity in the involved resources. Moreover, the involvement of the stakeholders can be a precondition to the sustainability of the value proposition.

The SEOs revenue model try to generate profit in order to self-sustainability. Maximizing profits is not a priority, financial surpluses are reinvested in the business. They are funded by different sources but usually prefer earned income strategies to reduce dependency of outside funding. Since increasing social value is at the core of SEOs business model, they use price differentiation and cross-subsidization to provide access to customers who could otherwise not pay for the product or service offered.

All these core features described let us to identify the SEOs business model as a social business model. Social business model is useful to organizations that aim to solve social problems by using business methods. These business activities should be undertaken in a way that is self-sustaining, and if some surplus is generated, it should be used to improve the level of attainment of social goals (Yunus et al., 2010).

In last years several studies have offered various perspectives of the social business model concept, highlighting different components (Martin and Osberg, 2007; Yunus et al., 2010; Michelini and Fiorentino, 2012; Michelini, 2012).

Austin et al. (2006) showed the social value proposition as a core concept that enables the exploration of the differences and similarities between traditional and social ventures. The social value proposition focuses on the opportunity '*to create social value by stimulating social change or meeting social needs*' (Mair and Marti 2006, p. 37).

Martin and Osberg (2007) stated that the critical distinction between entrepreneurship and social entrepreneurship lies in the value proposition itself.

Yunus et al. (2010) have identified four components of a social business model: value proposition (stakeholders and product / service); social profit equation (social profit and environmental profit); value constellation (internal value chain and external value chain), and economic profit equation (sales revenues, cost structure, and start-up capital or employed). Yunus et al.s' social businesses are employed by entrepreneurs sharing a social mission with an image of business-like discipline, innovation, and drive.

Michelini (2012) has developed the social value equation that describes the process by which the business could generate a social benefit.

Therefore, drawing on the different explanations of the social business model framework provided by literature (Austin et al., 2006; Martin and Osberg, 2007; Osterwalder et al., 2010; Yunus et al., 2010; Michelini and Fiorentino, 2012; Michelini, 2012; Cicellin et al., 2019) we use four main identification criteria to inform our analysis:

1. social value proposition (i.e. the benefits offered by the business model through products and/or services);
2. social value equation (i.e. the way the business model generates social benefit, in terms of risks and benefits);
3. social profit equation (i.e. how the business model manages the revenue surplus, whether to reinvest or distribute dividends);
4. start-up capital (i.e. the way in which the venture is funded, including through venture capital or start-up capital, and the nature of the entrepreneurship).

Through our comparative case studies and narrative analysis, we will suggest that the combination of the three approaches: social bricolage, social innovation

and social business model innovation, extends and enriches the concept of social bricolage in SEOs for producing social innovation.

### 3 Research Design

#### 3.1 Research setting. The Italian minor cultural heritage context

A great part of the enormous and heterogeneous Italian cultural heritage lacks a careful management and enhancement processes. The inadequacy of the public model and the non-profitability of the private one in the management and protection of the minor cultural heritage has triggered many organizations trying to defend and manage this heritage against from neglect and make it usable and accessible.

Despite the crisis of both public and private profit-driven models, in the last years, new and hybrid initiatives arose, and new projects are designed to meet this social need, drawing on the domain of social entrepreneurship.

The spectrum of social entrepreneurship in Italy includes both legally recognised and de facto social enterprises, as illustrated in Figure 1.

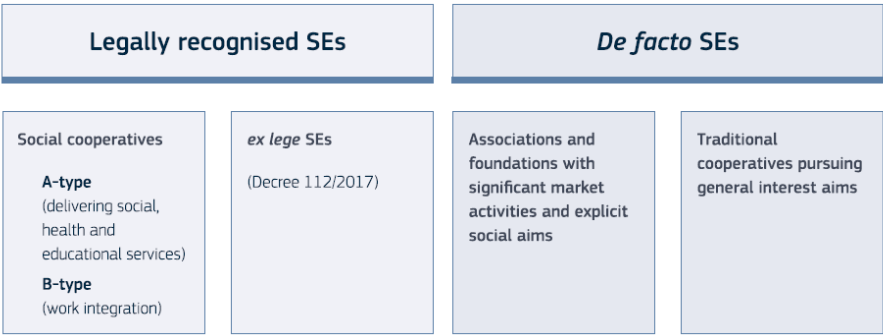

Figure 1. Spectrum of social enterprises in Italy  
 Source: European Commission, 2020.

The societal challenge of the SEOs in the minor cultural heritage field lies in proactive social change processes activated by many and different social innovators, public actors, religious institutions, private organizations and PPPs, citizens that shift from clients to key players resulting in new forms of bottom participation, community relations and work (Consiglio & Riitano, 2015). In this domain, SEOs are able to respond to the social need for a broader cultural

heritage consumption, to make abandoned sites available to citizens and tourists, filling a welfare gap (Pol & Ville, 2009; Murray et al., 2010; Caulier-Grice et al., 2012).

In particular, in the last ten years in the South of Italy we observe a flourishing of organizations that have launched social innovation projects applied to the management of minor and abandoned cultural heritage (Consiglio & Riitano, 2015).

Following these studies, in this paper we selected a deliberately restricted field of observation on the Mezzogiorno of Italy, with the aim of analyzing best practices of a part of the world we belong to, not only from a geographical point of view, but also from a political, human, cultural ones.

### **3.2 Methodology**

Our empirical analysis aimed to investigate the innovative social business models and the strategies of social bricolage of cultural SEOs for social innovation production.

This analysis is part of a wider research project targeting SEOs and Third Sector in different industries in the South of Italy and their ability to develop social innovation. This emerging field of research lacks an adequate theoretical basis, so we chose a qualitative method based on an inductive and interpretative research approach (Eisenhardt, 1989; Eisenhardt & Graebner, 2007). We employed a comparative case study method to provide a structured approach through an in-depth study.

We considered cultural SEOs that have taken one or more sites of historical, cultural and archeological landscape interest and that:

1. manage the cultural sites (e.g. churches, catacombs, historical buildings, villages, marine protected areas, gardens, etc., publicly, privately, ecclesiastical or PPPs owned) previously in a state of neglect and decay, through activities of recovery, promotion and enhancement by the community;
2. guarantee public use;
3. have defined a sustainable business and organizational model, going beyond the only voluntarism.

Special attention has been given to topics such as community engagement, stakeholder participation, and maintaining external legitimacy, all within the

particularly resource-constrained area of cultural SEOs (Gundry et al., 2011a; Gundry et al., 2011b).

Table 1 provides a brief description of the fifteen cultural SEOs from which we gathered data from informants. The organizations were selected to represent different geographical locations within the South of Italy (Campania, Puglia, Basilicata, Sicilia Regions) and a range of different activities in the cultural domain. The cases include SEOs in urban and rural locations.

Table 1 - Main characteristics of selected cases

Cases	Founded in	Legal form	Life cycle phase	Business orientation	Start up capital
#1	2006	Social cooperative A)	Consolidation	Not for profit	Private grant
#2	2012	Foundation	Consolidation	Not for profit	Private grant
#3	2004	Association	Growing	Not for profit	Own capital
#4	2017	Social cooperative A)	Growing	Not for profit	Own capital
#5	1998	Association	Consolidation	Not for profit	Own capital
#6	2005	Foundation	Growing	Not for profit	Public capital
#7	2013	Foundation	Consolidation	Not for profit	Private capital
#8	2008	Social cooperative A)	Consolidatio	Not for profit	Public grant
#9	2010	Association	Consolidation	Not for profit	Own capital
#10	2012	Foundation	Growing	Not for profit	Own capital
#11	2005	Foundation	Consolidation	Not for profit	Own capital
#12	2012	Social cooperative A)	Growing	Not for profit	Private grant
#13	2003	Association	Consolidation	Not for profit	Private grant
#14	2013	Social cooperative	Growing	Not for profit	Public grant
#15	2010	Association	Consolidation	Not for profit	Own capital

Source: our elaboration

We believe that this is a valid way to show events surrounding the emergence of the businesses under scrutiny, their intended scope and the motivation of their founders. This approach of explicit comparison enabled us to go beyond the specificities of a single case in order to identify similarities, commonalities and differences through careful abstraction (Yin, 2003; 2014), providing a coherent and integrated framework to answer our research questions.

The cases were purposefully selected in virtue of being information rich, revelatory and unique (Stake, 1995). We recall that generalizations in qualitative comparison are of a theoretical rather than a numerical kind (Palmberger & Gingrich, 2014).

Drawing on the bricolage framework (Johannisson & Olaison 2007; Zahra et al., 2009; Mair et al., 2007)) we use their main identification criteria to inform our analysis and to select the cases, that are:

1. making do;
2. refusal to enact limitations;
3. improvisation;

and then with the further criteria supported by the construct of social bricolage and empirically identified by Di Domenico et al. (2010):

4. social value creation;
5. stakeholder participation;
6. persuasion.

To collect the cases, we proceeded in stages. First, we started with initial desk analysis to obtain an overview of the cultural SEOs in the Italian context. We mapped all the Italian cultural SEOs that meet the first three criteria above mentioned (p. 17) and then we focus on those located in the Regions of the Southern Italy. This first sample of SEOs was used to identify common behaviour patterns, similarities and differences in the stories, in the organizational and the decision-making processes.

Secondly, we examined the organizations focusing on their social outcome, using the four criteria explained above of the social business model and the processes of bricolage and social bricolage (pp. 19-20). This allowed us to identify organizations that both maximize profit and respond to the unmet social need for cultural fruition.

Thirdly, we selected fifteen suitable cases also based on their willingness to participate and to be involved in our research. Our aim in presenting our cases was to show how cultural SEOs situated within environments that are *de facto*

resource poor justifies an investigation of social entrepreneurial actions organized to counter these constraints and to produce social innovation. Moreover through our case study analysis we want suggest that the strategies of social bricolage enable SEOs to create, extend and strengthen social innovation. This can be traced in the adoption of specific innovative business models creating social and economic value.

### ***3.3 Data collection and procedures***

We analysed empirical material collected, to identify actual experiences in the SEOs in the cultural domain. Data collection used two main methods, all consistent with the theoretical framework:

1. document analysis;
2. semi-structured interviews.

Triangulation allowed us to ensure case studies validity. Normally, data collection methods are triangulated (many methods are combined), but in addition to this, investigators were also triangulated (Denzin, 1978). Issues emerged from the data rather than the data being fitted to predetermined categories. Fieldwork was carried out between January and June 2021.

### ***3.4 Document analysis***

To better contextualize raw data emerging from the field, the author not directly involved in the interviews collected and reviewed information from a series of supplementary sources including organizational charts and further structural elements (in particular, workforce breakdown), annual reports, partnerships, budgets, business plan, social responsibility statements, newsletters, internal communications shared by the organizations, emails, archival material, press review, websites and social networks.

### ***3.5 Semi-structured interviews***

We carried out in-depth interviews with informants from each social enterprise. The choice of the informants interviewed is in line with the qualitative narrative-style approach (Czarniawska, 2004), hence we focused on well-connected and informed respondents, to get an in-depth understanding of a specific and new phenomenon. The first interview at each organization was with either the

Founder, the President, the CEO or the senior manager, and this was followed by further interviews with other informants identified as important by the first interviewee, such as founding members. This approach gave us the access to multiple individuals from each SEO.

All interviews were conducted by two of the three authors which took responsibility for organizing them, through a skype call. In addition to the interviews, site visits and observations have been used to add depth to the case studies. Each interview lasted between 90 and 180 minutes and was carried out between May and June 2021. Interviews were based on an open, wide-ranging, protocol (Holloway, 2005), shared one week in advance, and were guided through a semi-structured questionnaire, including questions about the start-up initiative; social innovation projects, public and private partners and actors involved and partnerships activated; business model; recruitment and selection of staff, training and assessment processes; and impact on the local community, possible venture capitalist, donations, call for bids. The protocol aimed to stimulate interviewees' interest in this participative research process, which is crucial when collecting data in this way. At the end of each interview the authors met to listen and discuss what had emerged. Moreover, the authors compared notes and interviews' records with the internal documentations previously analysed. All the interviews were tape-recorded and later transcribed verbatim, and we have used extracts to build the narratives. Using this approach, we were able to focus on statements underlining the social dimension, the social innovation produced and then we linked issues and features emerged to the main elements of social innovation from the literature, the framework of social bricolage and social business model (Nicholls and Murdock, 2012; Hoogendoorn et al., 2010; Di Domenico et al. 2010). To respect the anonymity of our interviewees, their names and those of the SEOs have been allocated a code (as expressed in Table 1).

#### **4 Main results**

We present first insights from the empirical research to propose an integrated conceptual framework that combine the social dimensions that can be leveraged by cultural SEOs to create social innovation. Therefore, the relation between social bricolage dimensions and social business model criteria in cultural SEOs produces outcomes in which social innovation can be expressed.

Our study contributes to the academic debate in two distinctive ways.

First, we provide reflections on new business models in minor cultural heritage management that arise to overcome the inefficiency of traditional management models and respond to a social need.

Second, in examining the social components of using bricolage in social entrepreneurship, we shed light on a partly jagged topic and aimed to extend and enrich literature on the theme, capturing its ability to be a model that respond to the minor cultural heritage issue and produce social innovation.

Our research empirically fills the gap between social bricolage and social business model in cultural SEOs and offers a conceptualization of the social components that inform new business model in minor cultural heritage management and produce social innovation.

## **5 Discussion and conclusion**

The present research contributes to the stream of literature on social bricolage and social entrepreneurship. Our study extends the concept of social bricolage in two directions.

First, we explore bricolage phenomenon in a contextualized setting, focusing on SEOs located in Italy and embedded in the cultural field, specifically in minor cultural heritage.

Second, we broaden the existing conceptualization on social bricolage by using the social business model framework. A crucial tenet of our reasoning is that the minor cultural heritage consumption need is hard to meet through traditional business model, which are threatened by socio-economic crises and the related public spending cuts and the failure of traditional models public, private, philanthropic (Consiglio & Riitano, 2015).

This study aims to be a benchmark of the social innovation initiatives in the field of minor cultural heritage management. Furthermore, it will help cultural organizations to rethink their strategies according to skills development to respond to the challenges of social change. From a managerial point of view, the main implication of our work resides in the offering new directions for integrating existing business models by incorporating the "social" dimension.

At the end of this first stage of the research study we can already state that

Until recent years, the leitmotif in cultural domain was that if there already was a steady economic growth, then extra resources could be invested in the management of cultural heritage. In other words, culture was regarded as

something subsidiary in the Italian economy. Nowadays culture management is a powerful engine of change for the regeneration of social environments and plays a crucial role in activating economic processes capable of positively impacting on communities (culture that changes the context). Moreover as a result of social context and economic changes occurring, culture is often itself an object of change (culture that changes itself).

The analysis and the comparison of our cases revealed that the investment in the management of cultural heritage has social returns that strongly contribute to the economic growth of our country and to the production of work.

The SEOs adopting innovative social business models represent an important prerequisite for the development of areas such as those of Southern Italy, which although not belonging to BOP or developing markets, offer important implications from a social point of view. Cultural SEOs in the South of Italy are activator of innovative social and organisational responses, which leverage proximity to communities and territories. Although our cases still are limited and circumscribed and reasoning in an overall approach, they emerge as powerful examples of widespread social entrepreneurship with a significant public function, that generate social innovation.

### **Abstract**

Since late twentieth century, the concept of smart city has been a central topic in public and academic debate. The smart city term is commonly used by local administrators and policy maker to promote and to prepare the cities for the future challenges. There are recent definitions of smart city but is very difficult to define the characteristics that describe how to become a smart city and how a local administration is committed to achieving this goal.

Using a project team with multidisciplinary skills is a popular tool in all types of organizations to respond to complex challenges. In this perspective, the project team can represent a tool for involving people and stakeholders in the Smart cities process.

One way of clarifying a team management structure is to consider the work which needs to be done to manage members. Although the details vary between professions and according to the level of gender, age, seniority, competence, knowledge of the members, in principle someone has to be responsible for the management tasks. Descriptions of

different team management are useful for research purposes, but also help teams and their managers to clarify their structure and the options open to them to make improvements. The aim study is to provide a better understanding of the nature of multidisciplinary project teams, out to investigate the important features of a particular multidisciplinary team and understanding how is led and how its member is managed. Infact, multidisciplinary team' is a term used to describe a variety of different interprofessional working arrangements.

A single case study design was used. The study design is qualitative based on participant observation, in depth interviews, and questionnaires. Data were collected by participant observation and semi structured interviews over a period of 6 months on a multidisciplinary team on smart city project of Catanzaro city. The team was observed through action research.

The results of this study describe the implementation process of a smart city project and characteristics of teamwork project. In particular, extensive reflections are employed on the concepts of orientation, leadership and team coordination as well as the skills employed and knowledge management.

The results offer practical indications to policy makers and local administrators on the development of a smart city project through the analysis and use of multidisciplinary teams.

The framework suggests directions and agendas for smart city research and outlines practical implications for government professionals.

## 1 Introduction

During twentieth century, the concept of smart city has been a central topic in academic and policy making debate. Smart city as term is usually used by local administrators and policy maker to introduce and promote future challenges in the cities. In academic debate, there are recent and various definitions of smart city; but is very difficult to define the characteristics that describe how to become a smart city and how a local administration is committed to achieving this aim. A very popular tool – for achieved this aim – is a project team with multidisciplinary. Multidisciplinary team is a term used to describe a variety of different interprofessional working arrangements. Under this perspective, the project team represent a tool for involving people and stakeholders in the Smart cities process.

One way of clarifying a team management structure is to consider the work which needs to be done to manage members. Although the details vary between

professions and according to the level of gender, age, seniority, competence, knowledge of the members, in principle someone has to be responsible for the management tasks. Descriptions of different team management are useful for research purposes, but also help teams and their managers to clarify their structure and the options open to them to make improvements. The aim study is to offer a better understanding on the nature of multidisciplinary project teams, out to investigate the important features of a particular multidisciplinary team and understanding how is led and how its member is managed.

## 2 Theoretical Framework

In last years, information, knowledge and digital technologies have been recognized as key drivers for the development of cities. In this context, smart city projects represent a new challenge of urban development. In effect, the flows of information and digital knowledge are the basis of a continuous improvement in the functioning of urban environments but are also used to tackle problems related to sustainable development (Komminos and Mora, 2018).

Smart city projects were originally used to support participation and social cohesion through the application of ICT (Anthopoulos and Fitsilis, 2015). Only later did the smart city take on a broader perspective, in fact it was not born only to create business opportunities in urban spaces, but also to install technical devices and sensors throughout the city to be incorporated into everyday objects and activities (Andročec, Novak and Oreški, 2018). Various smart city concepts have been developed, some of which, considered significant for the purposes of this work, are shown in the following table.

Table 1: definition smart city

AUTHORS	DEFINITION
Belissent et al., 2010	Forrester defines the smart city as [...] a «city» that uses information and communications technologies to make the critical infrastructure components and services of a city – administration, education, healthcare, public safety, real estate, transportation, and utilities – more aware, interactive, and efficient
Caragliu et al., 2011	The concept of the «smart city» has recently been introduced as a strategic device to encompass modern urban production factors in a common framework and, in particular, to highlight the importance of Information and Communication Technologies (ICTs) in the last 20 years for enhancing the competitive profile of a city

Schaffers et al., 2012	The smart city concept is multi-dimensional. It is a future scenario (what to achieve), even more it is an urban development strategy (how to achieve it). It focuses on how (internet-related) technologies enhance the lives of citizens [...] The smart city is about how people are empowered, through using technology, for contributing to urban change and realising their ambitions. The smart city provides the conditions and resources for change. In this sense, the smart city is an urban laboratory, an urban innovation ecosystem, a living lab, an agent of change
Yin et al., 2015	Smart cities emphasize the integration and connection of the physical, ICT, social, and business infrastructure in a city
Sepasgozar et al 2018	a smart city can be characterized as a complex ecosystem that stresses the application of ICT to make cities a more attractive and a unique place for innovation and entrepreneurship

Source: our elaboration

An improvement in the level of the quality of life is a fundamental part for the main actors in cities, people. (Niu, Dong, Niu and Deng, 2017). Furthermore, smart cities can become sustainable cities with a citizen-centered focus, which could play a critical part within the same project (Albino, Berardi and Dangelico, 2015). The existing literature notes that the smart city not only includes the application of ICT but also has the ability to integrate people, information and technology in building an efficient, sustainable and resilient infrastructure that provides high quality services and promotes the quality of life.

The implementation of smart city projects undoubtedly brings advantages, first of all a higher quality of life followed by an efficient use of resources. (Ismagilova et al., 2019). From all this it follows those higher levels of technology help the city to become more competitive than others (Juan, Wang, Wang, Leckie and Li, 2011). The implementation of a smart city implies a radical innovation that allows the development of a new technological sector in the urban economy and new forms of specialization (Malecki, 2014).

## **2.1 Multidisciplinary Project Teams**

Competitiveness and globalization have led organizations to face increasingly dynamic environments in which survival requires the adoption of flexible measures and structures.

In accord with Hoegl & Parboteeah, (2006) project teams are seen as a resource to respond to these challenges. According to Chiocchio et al (2009),

project management involves pooling and leveling human resources over time, space and organizational boundaries, in order to reduce downtime and thus promote the sharing of skills and the transfer of knowledge often through the use of information technology. Project teams are used in many industries ranging from manufacturing to information systems to research and development (Kloppenborg & Opfer, 2002). According to Kloppenborg & Opfer (2002) project teams also serve to manage change within organizations. The study of Chiocchio, et al (2009), underline that the development of individual and group skills are key factors in promoting the success of the project. The effectiveness of the project depends on the solidity and synergy between the members, in fact the project teams must show cohesion (Hoffman et al, 2002).

To be able to respond to the challenges of the new global market, organizations must be not only technologically enabled, but above all "intelligent" in their ability to enter into collaborations with other partner organizations and share different professional and cultural knowledge. The main building blocks of such organizations are precisely the multidisciplinary teams that work from different places and the team members belong to different organizations.

The study of Cuevas et al (2012) multidisciplinary project teams offer multiple perspectives and a wide range of skills to generate unique and creative solutions for solving various challenges. According to Ratcheva (2009) a multidisciplinary team has the ability to successfully execute a project, this is positively associated with the team's ability of relevant knowledge, skills and abilities that could be distributed among the various team members. Multidisciplinary teams represent new tool of information exchange and relationships. Fong (2003) points out that project team members must constantly absorb new technologies and techniques to remain competitive.

The success of an organization will increasingly depend on teamwork rather than individual excellence; working groups that are made up of individuals with different abilities, personalities, priorities. Collaborating and managing multidisciplinary groups becomes important for the enrichment of business processes.

According to Liston et al (2003) by their nature, project teams unite participants from many and varied disciplines using specific information formats, analysis and visualization tools for their specific work.

Knowing how to work in multidisciplinary teams is a skill to be constantly learned, cultivated and implemented.

It is a challenge to combine discipline-specific sets of information and representations to support multidisciplinary access, interaction and decision making. The decision-making process of the project teams is multidisciplinary and must take into consideration heterogeneous information sets.

### 3 Method

This study is based on an observed case. The methodological process developed is based on a qualitative approach, according to the methods and instructions suggested by Yin (2009). The data was collected through participatory observation and semi-structured interviews for a period of 6 months on a multidisciplinary team on the smart city project of the city of Catanzaro.

The team was observed through action research. This research approach is particularly suitable for analysing complex real-life events and helps to understand the meaning of people's experiences (Palmberg, 2010).

The documents considered were open access concerning the introduction of the "Smart City" Plan in Catanzaro. Hence, the authors developed a smart urban development planning framework using an action research approach. This paper presents this methodology and discusses the action research process used. Action research will interest professionals and academics. This document reports the lessons learned during the preparation and planning of the Smart City Catanzaro Plan published in 2020/2021. The results and the methodology presented are of great relevance. Action research included design, data collection, data analysis, reporting of results and action steps.

*Figure 1: Action research study framework.  
Source: our elaboration*

The case presented in this article concerns the development and implementation of a Smart City Plan. The main reasons why we have selected this case are the complexity of the project, the multidisciplinary nature of the project team and the number of stakeholders involved.

We have adopted a five-step cyclical process, which can be described as an ideal example of the original action research formulation (Susman and Evered,

1978) for the development of a Smart City Plan. In the analysis and action-taking phase, the researchers collaborated to actively intervene with stakeholders. The five phases of action research included design, data collection, data analysis, communication of results and action phases. During the first two phases functional operational problems were verified in traffic and designed for network services from ICT (Information and Communication Technology) and IoT technologies for the collection of big traffic data. In the third phase, stakeholders can use basic statistics or additional deep learning methods to solve traffic planning, order and road safety problems. In the fourth and fifth phase, the roles and benefits of the stakeholders participating in the service models were assessed and the problems and knowledge of the entire application process from a technological, economic, social and legal point of view were respectively derived and summarized. From an action research approach, AIoT-based intelligent traffic solutions have been developed and verified that allow the MOTC (Ministry of Transport and Communications) and interested parties to acquire large traffic data to optimize traffic conditions in the application of technology. With its implementation, it will finally be able to take a step towards the vision of the smart city. Derivative service models could provide more advanced traffic services to stakeholders, drivers and citizens and improve political work more efficiently and effectively.

#### **4 The Case Study Analysis**

The results of this study describe the project of change from a traditional city to smart city. Smart cities are the requirements of today's world. In particular, the results of this study observed the implementation of a multi-disciplinary teamwork project.

The observed case study is the project of Catanzaro city. The city of Catanzaro is one of the 100 Intelligent Cities Challenge (ICC) will unite EU cities in seizing the opportunity for green smart sustainable growth, improving the quality of life and fostering new opportunities for citizens. 100 cities will gain expert consultant support on the ground, facilitated sessions at several high-profile multi-city events, and a suite of online tools. In addition, they will benefit from the steering of cutting-edge mentor cities who help small groups of participant cities scale solutions together. The multidisciplinary project team is composed of n°1 General Manager City of Catanzaro propose the project; n°3 private consultants and n°1

project manager who are responsible for promoting the culture of interconnection between citizens, businesses and the public administration, the goal being the first approach to the smart city.

Table 2 - Smart city Team Staff

*Source: our elaboration*

The partners (strategic stakeholders) of the project include: the university; the order of the architects of the city; the trade associations that supported the team in the design and development phase of the project.

The City of Catanzaro have untapped potential, clear aspirations and strong commitment to grow. Cities will be supported to become an intelligent city of the future, today. Through the use of digital and advanced technology, this city will transform this performance, providing a higher quality of life for citizens and improving the competitive environment of businesses.

Smart City team of Catanzaro participated in a series of high-level events where they receive training as a group, learn from peers, and plan together for large-scale change. Along the way, world-class EU and international cities will inspire and orchestrate change. Finally, cities will get exposure to state-of-the-art intelligent city solutions, engage with impactful digital tools facilitating citizen and stakeholder engagement, and on-demand access to a variety of downloadable material.

The team project aims to prepare cities for a transformation, support them through that journey, and grow a community that is larger than the sum of its parts:

1. Phase: Find out **where a city is, where it should go** and who should be involved to get there. Un aspetto importante gestito dal team è stata la regolamentazione della gestione di una Smart City, attraverso l'analisi del contesto urbano con un audit mirato all'analisi di indicatori, in grado di parametrare il livello di inter-connettività, dal quale poi si

sviluppa il progetto dell'infrastruttura o la sua implementazione, dopodiché, misurando l'appeal commerciale e le necessità pubbliche, si è predisposta la proposta. Le giornate dedicate all'ascolto degli stakeholders è avvenuto in più focus Group. L'obiettivo on how to motivate an ecosystem, define a strategy and set a measurable action plan.

2. Phase: Develop a concrete plan to achieve improvements, collaborating with the community, push action with immediate benefits
3. Phase: Get "big moves" **done** and **see results**
4. Phase: Measure success, and commit to **keep connections and improvements going**.

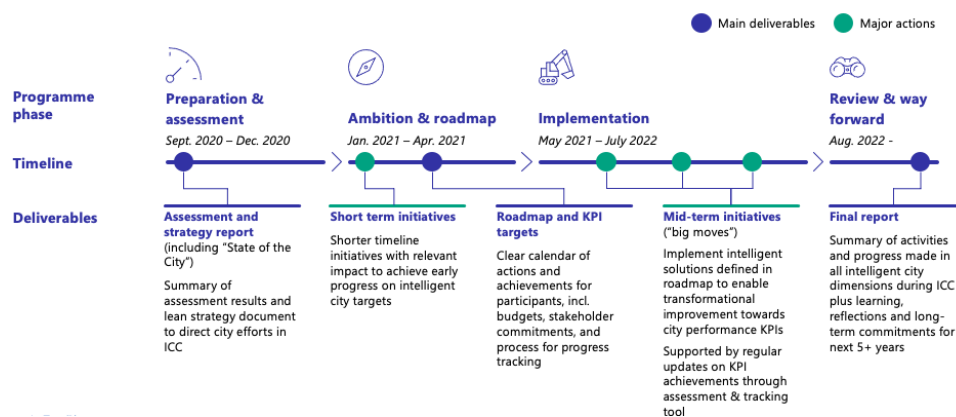

Figure : the programme phase

So, in this moment the City of Catanzaro is situated in the first phase "**Preparation & assessment**". The team chosed a path thematic track and begin the assessment process, drawing on tools including citizen engagement. First, developed an understanding of city needs and possible solutions at a need's assessment workshop. Secondly, understood your maturity of solutions and how your city can grow at the solution assessment and strategy workshop. In parallel, assembled and energise the city's ecosystem with a stakeholder workshop, whit a local launch

## 5 Consideration

This study is a work in progress. In effect the findings of this study are preliminary findings. The aim of this work in progress is not only to provide a ample theoretical framework on this topic, but also to support local governments and public administrations in the effective implementation of smart cities, capable of creating public value and well-being for citizens and environmental sustainability in the urban space.

The ICC is part of a wider EU support contributing to a European Green Deal, an economy that works for people and a Europe fit for the Digital Age. This leads to incorporation of project management in the development of smart cities. This development requires skills and expertise leading to need of project teams. These project team brings lot of challenges with respect to their effective operations. The 2021 is an exciting year for the ICC, starting with the finalization of the preparation & assessment phase and the 2nd city lab and followed by the Ambition & Roadmap phase during the Spring\Summer before we enter the implementation phase.

## Covid-19: Knowledge Workers in Slippers

---

Yasmina Khadir \*

Nyenrode Business Universiteit  
Straatweg 25, 36221BG, Breukelen  
The Netherlands

### Abstract

Knowledge workers are often emphatically introduced in the literature as nearly omniscient super workers. Consequently, it can be reasonably expected that these special employees are particularly agile and adapt very well to unusual circumstances. Let us now consider a context where an organizational design known as Holacracy, a framework where hierarchy is downplayed, where self-organizing team are entitled with authority and decision-making, is developed to support knowledge workers in their endeavours. The outcome of such a combination should be exceptional and coping successfully with exceptional working circumstance such as 'forced to be working from home' should not be much of a challenge. Unfortunately, the reality shows otherwise. The current pandemic-induced situation has created an unprecedented context for studying knowledge workers' behaviour under unusual working circumstances. To better understand the true nature of this knowledge worker and the limits of working-from-home, an empirical qualitative study encapsulating 7 semi-directed interviewed is conducted. The knowledge workers interviewed are part of a large telco and information technology company based in the Netherlands. The results show a contrasted reality; some of the very features that constitutes a knowledge worker and her or his work (autonomy and independence; proactivity; knowledgeable, skilled, and doing meaningful work; importance of teamwork; efficiency gains; self-confidence) are confirmed. Simultaneously, other unusual aspects emerged (better efficiency in office context; decrease in engagement and motivation, poorer quality of communication and relationships with peers; lack of work structure; health issues; unsustainable workload; ergonomic and organizational structure issues). The originality of this paper resides in the fact that most of existing studies about flexible working are about voluntary remote working while this paper investigates a compulsory remote working that not all workers are happy with. The results of this study may benefit practitioners and firms that are considering developing working-from-home, partially or totally in designing their flexible and remote working strategy.

**Keywords** – Knowledge worker; Working-from-anywhere; Holacracy; Covid-19.

**Paper type** – Academic Research Paper

## 1 Introduction

The different lockdowns and curfews implemented in different European countries in 2020 and 2021 to limit the spread of the Covid-19, has dramatically impacted the way work is performed in organizations. This new configuration where employees and employers are required to work from home, is calling for revisiting some of the theories developed about the knowledge worker, his inclination for working independently while being engaged and motivated by his work. Knowledge workers are generally characterized as bright intellectuals, men of skill, knowledge, and judgment (Drucker, 1959). This category of workers single itself out of the traditional worker by the nature of its activity (knowledge work) and her or his employment relationship (Adler, 2007). While this group may appear marginal, Drucker (1992: 89) acknowledged that *"the ruling group will be knowledge workers, knowledge executives, knowledge professionals, and knowledge entrepreneurs who have the insight to allocate knowledge to productive use the way the "capitalists" knew how to allocate capital to productive use"*. More recently, Clemons and Kroth (2010) suggested that knowledge workers are viewed as 'nomadic workers' literally able to work from anywhere and anytime. Subsequent to the pandemic-induced socio-economic and institutional context, it can be reasonably expected that more workers join this dynamic 'road-warrior' group.

While the literature on flexible work design (Koroma *et al.*, 2014, Ojala and Pyöriä, 2015 ), its relationship with employee well-being (Hoeven ter and Zoonen, 2015) or mobility of knowledge workers (Migueluez, 2019, Ojala and Pyöriä, 2018), is established, the literature concerning how knowledge workers cope with a forced work from home (WFH) situation is yet to be developed. This paper undertakes to investigate this problem and presents a study of an 'ideal' knowledge worker for which an organization designed a structure supposed to strengthen their natural characteristics: a holacracy. This paper seeks to empirically understand how the knowledge worker, for whom an ad hoc organizational structure is designed in the form of a holacracy, is performing while forced to work from home.

In the following section, a theoretical framework encapsulating a discussion on the themes of knowledge workers and work, working from home, and holacracy, is introduced. After a short methodology, the results of the qualitative study are presented before the paper closes on a conclusion-discussion section.

## **2 Theoretical framework**

### **2.1 Knowledge workers and knowledge work**

Characterizing what knowledge workers are in literature has revealed challenging as no real consensus has been achieved to date (Pyöriä, 2005, Crowley-Henri, 2008). At best, this category of workers is approached from different perspectives, namely with a combination of intrinsic characteristics, original working habits and the environment within which they are supposed to thrive (Khadir-Poggi and Keating, 2013, Mládková *et al.*, 2015). Indeed, Peter Drucker singled out this worker form 'traditional' ones and highlighted her or his intrinsic qualities, locus of activity, and high level of commitment (Schermerhorn, 2012). He described these workers as bright intellectuals, men of skill, knowledge, and judgment. The nature of their professional activity and their employment relationship present also unique characteristics (Donnelly, 2009, Wang and Ahmed, 2003).

Knowledge workers are viewed as knowledge-seeking individuals (Drucker, 1993, Swart, 2007, Reinhardt *et al.*, 2011) that, unlike 'traditional' workers who seek long-life employment, prioritize employability and life-long learning. In other words, they are continuous learners and continuous innovators (Drucker, 1999, Despres and Hiltrop, 1995). They built their capabilities on their work experience, accumulated know-how and proven mastery. Knowledge workers have problem-solving skills which they can apply through research, product design or fabrication and problem-identification skills which they use in marketing, advertising and customer consulting (Swart, 2007).

Where a 'traditional' worker's locus of work is firm-centric, KWs socialize, associate with professions, networks and peers that are not necessarily company-specific and may be outside the boundary of the company. They tend to develop their own social environment and own professional networks and build their own market niche to express their unique set of expertise (Reich, 2002, Wang and Ahmed, 2003). Although knowledge workers personal network evades the constraint of purely inter-organizational connections (Sedita, 2008), firms can definitively benefit from the opportunities these multiple networks can provide.

They are dispersed across organizational structures and around the globe but often linked through the Internet (Davenport, 2005, Defillippi *et al.*, 2006). Thus, knowledge workers play a central role in steering organizational learning efforts.

In addition, the pervasiveness of the use of mobile devices in the working place stimulates continuous exploratory learning behavior and promotes the development of new skills and capabilities that enables adaptation to new contexts (Reyt and Wiesenfeld, 2015).

Knowledge workers are mentally and emotionally committed to the job performed in an organization and highly involved in their professional tasks (Benson and Brown, 2007, Ipsen and Jensen, 2010, Joo and Lim, 2009), although empirical research on their motivation is rare (Mládková *et al.*, 2015). They need substantial autonomy to pursue initiatives and to extend their intellect (Snell *et al.*, 2001, Koslowsky *et al.*, 2012) and are attracted by challenging tasks which requires considerable creativity and initiatives (Alvesson, 2000). In line with the requirements of the post-industrial society, knowledge workers are generally considered as mobile and dynamic or 'nomadic workers' who can work anywhere and anytime (Clemons and Kroth, 2010). This trend is being reinforced by the pervasiveness of new forms of information and communication technologies such as smartphones and tablets (Eurofound, 2016, Popma, 2013). Surprisingly however, this trend did not confirm as expected with changes being in fact more gradual (Vilhelmson and Thulin, 2016) with the working in an office 8 am to 5 pm pattern remains strong (Glorieux *et al.*, 2009, Ojala and Pyöriä, 2015 ).

Going a step further, scholars pointed that knowledge workers' work is usually under-designed and making sense of the latter is considered as part of the job (Alvesson, 2001, Hatchuel, 2002). Drawing on Manz (1986), the notion of self-leadership is put forward to explain how a worker use advanced metacognitive skills to bridge his or her under-designed work. Provided that this work is non-routine and complex by nature (Davenport, 2005), a substantial controlled attentional effort is necessary (Müller and Niessen, 2018), effort seen by Vohs *et al.* (2018) as a depletable resource.

While autonomy is identified with freedom at work (Bäcklander *et al.*, 2018), several scholars highlighted how knowledge workers actually create their own predicament and willingly lock themselves in an exploitation situation (e.g., long working hours) in exchange with the very freedom they seek, situation referred to as 'autonomy paradox' (Ipsen and Jensen, 2010, Muhr *et al.*, 2012, Pérez-Zapata *et al.*, 2016). Somehow, the opportunity to work 'anywhere/anytime' transformed in working 'everywhere/all the time' (Lupu and Empson, 2015, Mazmanian *et al.*, 2013), resulting always in knowledge workers working more (Bäcklander *et al.*, 2018).

## **2.2 Working from home (WFH)**

The context created by the Covid-19 pandemic put to the foreground the 'not working from the office' alleged opportunity for workers. The two concepts that are introduced to represent this trend are WFH and, more recently 'working from anywhere' (WFA) formulated in the second half of 2020 (Choudhury, 2020). Some scholars introduced a quite positive view on WHF. Barrero *et al.* (2021) identified five reasons for which they argue that WFH is a new organizational trend that is here to stay: (i) surprisingly positive WFH experiences; (ii) pandemic-induced investments in physical and human capital supporting WFH; (iii) diminishing stigma associated with WFH; (iv) continued concerns about mingling and proximity with others; (v) pandemic-induced technological innovations improving WFH. Considering this possible ineluctable trend, employers can reasonably fear losses in productivity as workers may be less engaged in their tasks. Contrasting with this apprehension, drawing on an experiment, Bloom Bloom *et al.* (2015) found out that WFH can be associated with higher productivity, improved work satisfaction and less turnover. However, the same authors found out that the perspectives of promotion for these workers, stalled.

Contrasting with this positive view of WFH and the expectations about its widespread adoption in the future, other scholars are less enthusiastic. They found out that, despite having access to mobile technology that facilitates WFH, knowledge workers still tend to favor working in office (Ojala and Pyöriä, 2018). Moreover, while mobile technologies empower knowledge workers (Popma, 2013), it also introduced work in their private spaces and their families to the workspace, creating a struggle for these workers who cannot manage both work and non-work activities. These same authors pointed out that the work domain tends to prevail on the non-work one (Field and Chan, 2018).

## **2.3 Holacracy**

An ad hoc organizational structure facilitating this knowledge workers' work lies in the holarchy of self-organizing teams as opposed to the traditional organizational hierarchy. Holacracy is defined as "*a real-world-tested social technology for agile and purposeful organization. It radically changes how an organization is structured, how decisions are made, and how power is distributed*" (HolacracyOne). This form of organizational structure is designed to overcome the

traditional hierarchical organization and implement a decentralized system (Groth, 2018).

This holarchy of circles is not a set structure but evolves over time to embrace changes. On the people level, this organizational form places an emphasis on the role instead of job titles that are often status-related and not necessarily exactly representative of the work an individual performs in a firm (Kamp de, 2014). Holacracy is viewed as a relatively new trend expected to meet the agility requirement of software companies (Bhandari and Colomo-Palacios, 2019). Considering a working environment characterized by both organizational agility and self-managing systems such as Holacracy, knowledge workers should fit naturally and embrace the potential promised by their intrinsic nature. Indeed, these workers are known to appreciate autonomy in the way they work, independence in making decisions, and a creative working space among other things. Self-managing structures should also stimulate their motivation and engagement at work. The current Covid-19 pandemic has pushed further the dematerialization of a conventional working environment making 'working-from-home' (WFH) or 'working-from-anywhere' (WFA) a reinforcing dimension featuring a supposedly better working environment for knowledge workers.

### **3 Methodology**

Motivated by an endeavor to understand the complex situation within which knowledge workers are evolving since the beginning of the Covid pandemic, a qualitative approach is better suited (Creswell, 2009). The data collection instrument is the semi-directed interview, and a content analysis approach is used to analyze the data. The interview guide was designed with a combination of themes emerging from the literature review and the research objectives. The questions concerned autonomy at work, working from home pros and cons, work-life balance and boundaries issues, health and workload issues, overall feelings, teamwork, appreciation from peers, and alignment between company goals and knowledge workers ones.

Within this undergoing research, the focus is put on the technical team of a large telecommunication and IT company based in The Netherlands. The interviewees occupy different positions at different hierarchical levels (Migueluez, 2019), (e.g., two software architects referred to as conceptualists in a holacracy language-, a team leader designer, a software developer – referred to as

specialist-, two team leaders in 'development' and a major leader) and are all between 30 and 40 years old except for one who is over 40. Except for one, all interviewees were engaged in marital relationships. Two of them had no child while the rest of the sample had between 2 and 3 children. Finally, the persons interviewed were working in the company since at least 3 years except for one. The audio-recorded semi-structured interviews lasted between 30 and 60 minutes.

#### 4 Results

Subsequent to a content analysis where the priority is given to theme emergence, the final coding stage delivered two major categories mentioned hereafter in a decreasing code frequency: working from home issues and limitations and knowledge worker/work or working from home benefits. Table 1 delineates the different sub-themes attached to the main categories; these are respectively developed in the following paragraphs.

Table 1. Content analysis results

Categories	Sub-themes
Working from home issues and limitations	<ul style="list-style-type: none"> <li>• Better efficiency with in-office work (38)</li> <li>• Communication and relationships with peers (35)</li> <li>• Engagement and motivation down (27)</li> <li>• Lack of work structure/rhythm (17)</li> <li>• Health issues (11)</li> <li>• Unsustainable workload (8)</li> <li>• Ergonomic issues (7)</li> <li>• Organizational structure issue (7)</li> </ul>
Knowledge workers / work – Working from home benefits	<ul style="list-style-type: none"> <li>• Autonomy at work and at home (34)</li> <li>• Knowledgeable, skilled, and doing meaningful and creative work (30)</li> <li>• Proactivity (26)</li> <li>• Teamwork (19)</li> <li>• Efficiency gains (16)</li> <li>• Self-confidence (10)</li> </ul>

## **4.1 Working from home issues**

### **4.1.1 Better efficiency with in-office work**

Interviewees found that working in the office is more efficient than remote working. For example, in some instances the same information has to be repeated/explained differently to different employees because of disorganization problem: *"So it's like two, three, four hours of my time. With these different audiences and then still when it came to naming the product..."* (Conceptualist). Results also show that employees are more productive and creative in the office through *"true interaction and true cooperation"* (Team Leader). Spontaneity is introduced as important for creativity. Finally, some of the interviewees noted that WFH was characterized by an altered perception on emergencies with workers realizing when deadlines are reached, the work to be delivered.

Frustration was voiced over the sequential nature of collaboration and work with peers while using digital tools: *"You have to wait until that person is available or you send them a message and you will get something back, but you don't get that kind of dynamic"* (Conceptualist). The whole process of working with a team became much more formal since communication became digital. All communication must be more specific and detailed, function filled by the context when working in office. Spontaneity and efficiency are also hampered as due to technical restrictions, only one person at a time can speak during online meetings: *"I think in my experience, I have better focus when I'm at the whiteboard in office. If I'm on my laptop and have to use application, I have to figure out different tools. (...) And that's distracting. And also, it basically limits you of what you can draw. And with a whiteboard, it's a completely free"* (Conceptualist).

### **4.1.2 Limited communication and relationships with peers**

One of the most important issue that is raised by interviewees is that distance communication limits the transfer of knowledge at two levels. First, the work-related informal communication that rhythms an office day and that contains marginal but precious content, is not available anymore. Working and meeting online creates an absence of context leading knowledge losses and frustration for the employees. More specifically the latter creates a feeling of eviction that is counter-productive among knowledge workers: *"So unless you're in the 'need to know' category, then you don't get to know, basically. Sometimes that info is kind of, can even hurt you. So instead of it being more dispersed, it's more channeled. It's*

*the same with a lot of your colleagues if you don't actively work with them."* (Conceptualist). Additionally, while WFH within a Covid restricted environment, organizational culture is also negatively impacted, particularly for a firm which activity spans over several country as this is the case for the one investigated: *"Do you remember what our values are? It's difficult to build a company culture remotely, like this"* (Major Leader). Overall, people feel less appreciated if they have less social contact. Basically, they seem to miss feedback that would normally come via coffee-machine conversations.

The second dimension that is impacting the transfer of knowledge in this organization, and always related to a missing context or rather an unusual context, is the invisible cement that mundane or non-work-related conversations, create. These moments are referred to as 'coffee-machine' talks, and these are: *"difficult to feel through digital means. (...). I just sense that it's an entire layer of informal communication that is now gone."* (Conceptualist). Employees do miss these times of informal moments as it has a social significance: *"I do miss it. Just a chat, even with a restaurant lady. It's not meaningful to work, but it's meaningful socially. Sometimes you discuss work stuff related at the coffee machine, but usually it's more "how are you are you, are you feeling well?"* (Team Leader). This situation has two negative impacts: (i) team building which represents an important dimension in this company; (ii) people feel less appreciated if they have less social contact. Basically, they seem to miss feedback that would normally come via coffee-machine conversations.

#### *4.1.3 Engagement and motivation down*

More than half of the interviewees felt demotivated and experienced a decrease of their engagement at work. This situation is partly due to a mismatch between company's vision and the ones from the employees as this was signaled on several occasions. A lack of management support has also been underscored. Despite their independence at work, their drive and initiative, the employees expect more leadership from their managers: *"But when it comes down to getting clear projects and definitions coming from the upper circle, I think it's very lacking"* (Team Leader). Finally, a couple of employees shared their fear over not be trusted when WFH and compensated this feeling by sending more emails.

#### 4.1.4 Lack of work structure/rhythm

Interviewees acknowledged that a day at the office had an important structuring power that they struggle to replicate at home. Having a distinct location for work and another one for private life had the effect to set a very clear boundary between private life and office work. When WFH, respecting the boundaries is more challenging. In addition, several employees regretted the absence of commuting as it allowed them to clear their minds: *"Before covid, you were forced to travel somewhere. So. If it takes your mind off things and when your mind is just a bit blank it usually comes up with stuff"* (Team Leader). Basically, it is difficult for these employees to stop thinking about work once they passed the door back home. Commuting time had a switching function. Some would use this time to reflect on the working day and structure their thoughts, others would listen to the music. By the time these employees arrive home, they were 'ready' for private life.

#### 4.1.5 Health issues

The two health issues that were reported by the interviewees while WFH are weight gains and mental struggles. Indeed, employees reckoned that they were moving less and tended to eat junk food. Other mentioned their struggle with isolation: *"I was a little bit fatigued in the winter. Yeah. And I do think that my mental health went down because of the isolation"* (Team Leader). Some interviewees also mentioned increased screen time, but not necessarily related to work. More digital leisure was responsible for this latter increase.

#### 4.1.6 Unsustainable workload

Several interviewees underscored that the workload increased since forced WFH. A substantial amount of time must be spent in planning events. Efforts involved in synchronizing with few people for these events were presented as daunting. This energy and time drag also comes from the substantial increase in the number of meetings (for which employees must synchronize) experienced since the beginning of this situation: *"Well, you just have so many meeting blocks all the time, I have at least four or six hours of meetings, daily, however, that's chopped up"* (Conceptualist).

#### *4.1.7 Home and ergonomic issues*

Most of the interviewees (5 out of 7) mentioned that they invested or reorganized their homes to improve their work: "So as soon as I did that, I could be just as effective at home as I am at work in terms of productivity. So, yeah, that was the first thing I did. I make sure that I have three screens and the same mouse and keyboard because I'm used to it and efficient that way" (Team Leader).

#### *4.1.8 Structural issue*

Finally, the remote working situation highlighted the existence of silos keeping department and people at a distance from each other and preventing productive work.

### **4.2 Knowledge workers / work – WFH advantages**

The category of knowledge worker and knowledge work can be viewed as positive dimension of WFH in a sense where these employees characteristics and the work they operate.

#### *4.2.1 Autonomy at work and at home*

Autonomy is an important issue for knowledge workers: *"What worked for me at least, is that I'm autonomous, so I do like that I can have some freedom"* (Conceptualist). The interviews showed that they considered themselves as very autonomous in their work, deciding about their working schedule at home (*"OK, so last year I just suddenly changed my office hours from 7:00 in the morning to 4:00 in the afternoon, or even 3:30 in the afternoon. And I decided to go swimming after I was finished working. Do I feel free? Well, I've seen people working from India, from Italy, and I was thinking, if I want to go on holiday in December, then probably I need to work one day from wherever (...)"* (Team Leader), the way they work and where they work from. Some have even already planned to work remotely in the future referring to this situation as *"mentality of freedom with responsibility"* (Team leader). This autonomy so dear to knowledge workers is also central to WFH work-private life balance management. This argument came quite strongly in the interviews. Many of these workers learned to put boundaries up between work and private life, mainly lower-level workers. Management kept a boundaryless interface, mixing both work and private life.

#### 4.2.2 Knowledgeable, skilled, and doing meaningful and creative work

Some interviewees described how they proceed with their work and how understanding every aspect of it is important. They are conscious of the weight of the learning curve and how this helps them solve complex problems. Moreover, in their answers, the interviewees highlighted their sensitivity to peers' appreciation, feeling that is less evident as they had to work from home. They also mentioned that doing a meaningful work was part of their *raison d'être*: *"For me, it's meaningful. So, for me, it's important that the work that I do is being used and is being valued, and I know that the things that are being built are being deployed at some point and are being used. So, for me, that's meaningful. So, I'm not developing something that will end up on the shelf and not being used"* (Conceptualist).

#### 4.2.3 Proactivity

Being proactive encapsulates both the strong drive of interviewees to adapt to new situations and the positive attitude they display within challenging circumstances. Thus, WFH is not an issue anymore: *"I think the location doesn't change my motivation. It's more of a challenge I'm working on. And am I working here, I'm now downstairs in the lounge, or in the garden or at the balcony, it doesn't matter. It's more what I'm working towards to, that's more important to me."* (Team Leader). In line with this attitude, interviewees acknowledged that they did not experience any increase in their workloads nor engagement while WFH.

#### 4.2.4 Teamwork

The interviewees were all enthusiastic about working in teams and the support they were getting from peers: *"I think the people I work with are highly supportive. When I want to ask something of them, they will do it. So, it's when I need help and I ask for their help with something, they will be there. So, there's no question, they're not like putting me back on their queue or something like that. They will just do it. So that's quite nice to have"* (Team Leader). The integration with the team is very strong as employees feel safe enough to process their emotional reactions in slack channel: *"(...) so I keep myself sane a bit by a bit. Sure. So, I share the high, so I also share the lows"* (Team Leader).

#### 4.2.5 Efficiency gains while WFH

Interestingly, the interviewees explained that they were better off WFH rather than working from the office as the latter is a distracting environment. More precisely, a distinction is made about the type of work that can be done at the office (e.g., that engages several peers for example), and the one that is better performed from home. In this previous situation, the employees found it easier to stay focused and concentrate on difficult and time-consuming tasks at home. The interviewees also appreciated the flexibility they can enjoy while working as this is more adapted to their personal rhythms of work and personalities.

#### 4.2.6 Self-confidence

Finally, a trait that is well-known among knowledge worker is self-confidence. This feature was clearly noticeable during interviews.

### 5 Discussion and conclusions

This study explores how knowledge workers forced to work from home perform in their work and how they live this whole remote experience. The results showed that knowledge workers faced differently the forced WFH situation. At the two extreme points of the spectrum, one of the interviewees operating from abroad was very comfortable, happy and productive. At the opposite, another interviewee was close to depression. While the highest frequency was recorded for the 'WFH issues', category which is discussed hereafter, the WFH benefit was nearly equally important in terms of code frequency.

The study showed that the interviewees found that they developed a better productivity and efficiency while working in the office confirming a surprising preference for the 8 to 5 working pattern in a traditional office identified by Glorieux *et al.* (2009) and Ojala and Pyöriä (2015, 2018). The 'surprise' is indeed acknowledged as it is not expected from the clear desire for autonomy employees displayed, suggesting that this characteristic presented by Davenport (2005) or self-leadership (Manz, 1986), should be redefined. Instead, the study found that knowledge workers create their own predicament working long hours as some are unable to manage their working day at home, confirming the 'autonomy paradox' (Ipsen and Jensen, 2010). Some of the employees found that, in total they were working more (Bäcklander *et al.*, 2018). Another contrast to underscore

concerns the alleged increase of productivity; this was not unanimous, and the interviewees clearly stated that it depended on the nature of the task, result contrasting with Bloom et al. (2015). Thus, the dynamic 'road warrior' may reveal a myth after all contradicting Clemons and Kroth (2010).

The expectations linked with the promises of technological development were not met and the interviewees voiced a substantial frustration over the quality, intensity and content of online collaboration confirming Vilhelmson and Thulin (2016) contribution. Moreover, a lower engagement and motivation are signaled as the knowledge workers experienced exhaustion (Vohs *et al.*, 2018) after the attention and effort spent online (Müller and Niessen, 2018). Finally, contrasting with Groth (2018), the interviewees described their holacracy organization as siloed, issue that became salient when WFH.

On the positive side, the study confirmed most of the literature regarding the characteristics of knowledge workers and work. A total control of their life (work and home) emerged as the first theme that one interviewee summarized with 'freedom with responsibility' mentality, and confirmed the leading literature (Davenport, 2005; Manz 1986). The interviewees showed that they were well aware of their career progress (Swart, 2007, Wang and Ahmed, 2003), and appreciated to be challenged in their work as their reward was the creation of a meaningful contribution for all innovators (Drucker, 1999,1993, Despres and Hiltrop, 1995, Reinhardt et al, 2011).

This research suffers several limitations besides the usual interpretative dimension inherent to qualitative studies. Although this study is performed in a holacracy with knowledge workers, the group interviewed was only the technical team of the one Dutch company, and this hinders the confirmability of this work. Additionally, it is believed that the context of forced WFH brought in extreme sentiments from interviewees. One must bear in mind that this new working situation was sudden and most of the working world was unprepared. The scale and rhythm of adaption from all parties, including families, was unprecedented in the effort and uneven in its success. However, concurring with Barrero *et al.* (2021), it seems that this trend is here to stay as, during the interview, a subsidiary question was asked to know if the knowledge workers would be happy to continue working from home. The workforce has a clear preference to continue working mainly from home and come to the office a couple of day per week. In contrast, managers' report high dependency on meeting people physically, the need to feel the context through constant communication.

### Abstract

The global coronavirus (COVID-19) pandemic represents a challenge for nations in 2020, not just in health issues, but even in well-being, job adaptation, digital competence for the future and develop new types of entrepreneurship among populations (ILO-OECD, 2020). The impact of COVID-19 on workers, workplaces and homes across the globe have been a digital-changing move, but at the same time drastic (Kniffin et al., 2021). The traditional work dynamics were transformed in short-time and in this new landscape, sudden implications for entrepreneurs, employees, teams and organizations emerged not only in digital issues, but even with the decreased physical and mental well-being status of the people (Xiao et al., 2021).

Even though previous studies pointed well-being and its positive relationship with job performance and satisfaction (Wright and Cropanzano, 2000; Cotton and Hart, 2003; Van De Voorde, Pauwe and Van Veldhoven, 2012). This study is focusing on the impact of the perception of well-being during this pandemic and its objective is understand possible

*emerging changes in work and entrepreneurship derived of COVID-19 lockdown.* In addition, categorical factors of age, gender, educational level, type of work or entrepreneurship, type of income source and the modality of adaptation are included to generate differentiated effects in the sample.

The method used to collect data was an online adapted questionnaire that capture the job dynamics inside homes and lifestyles adequations, changes in income sources and modifications of habits (Pennebaker, Ashokummar and Vergani, 2020). The instrument was deployed online from August 1 to October 1, 2020 and the respondents were mexican people who had the chance of adapting their job or entrepreneurship in remote-work. We received 587 responses valid (age 18-21 years=63.7% and women=65.8% of the sample). Variables of the first section integrated an index, that we named Index of Perception of Well-Being in Covid-19 pandemic (iWB-19) by using a structural equation model to verify the validity of the information (Hair et al., 2010, 2012, 2018; Iacobucci, 2010).

In summary, the lockdown has generated different emotional conditions among people, especially in well-being perception, changes of work dynamics and entrepreneurship perception. However, the future implications of these results are in economic and educational fields. Promotion of well-being habits inside organizations, the digital and resilience adaptation for future careers (Hite and McDonald, 2020) and new challenges for digital-inclusive education, remote working and digital entrepreneurship (Felstead and Henseke, 2017) are the challenges to face to 2030.

## **1 Introduction**

The well-being and health of people is an important element in the personal development, unfortunately in most cases it is forgotten or undervalued. The disease, the risks of complications of chronic diseases, new physical and psychological diseases shape our social, economic and political dynamics (Bloom and Canning, 2003). Understanding how well-being is linked to our abilities and its direct effect on work requires multidisciplinary research that allows addressing these relationships from multiple points of view for new models of well-being.

Just over a year ago, as humanity we have experienced a new dynamic, unthinkable for the beginning of this new millennium: The COVID-19 pandemic. And with this, we have put the health issue on the global agenda (World Economic Forum, 2020), this has caused a global concern in the prevention of the contagion of this new SARS COV-2 virus, that is why in the majority of countries paused educational and commercial activities, modifying habits and dynamics of social coexistence, step by step entering a voluntary seclusion, which transgressed

the traditional patterns of life related to the well-being of the individual: work, education, food, physical activities and social coexistence. The costs of this social distance have been very high, especially for emerging economies such as Mexico, since not all jobs were able to adapt to these remote working conditions mediated by Information and Communication Technologies (ICT), people who were able to do so, they had to experience unique and drastic changes in their lifestyles and with their perceived well-being.

This global uncertainty effect was transferred to both organizations and individuals. Various ailments, physical and emotional affectations such as sleep, eating and vision disorders were reported by various studies during the COVID-19 quarantine period (Dey and Dey, 2020; Singh *et al.*, 2020).

In this sense, the main objective of the present work is to describe the main behaviours related to the perception of individual and social well-being in the framework of the global health crisis caused by the COVID-19 virus that allows dimensioning work and entrepreneurship from another perspective.

## **2 Perception of Well-being and COVID-19**

The description of well-being in the context of COVID-19 is a challenge that undoubtedly leads us to reflect on the relationship between physical and mental health and the productivity of people who have carried out their work remotely at home. According to the guidelines of some organizations, faced with the complications of the pandemic, many workers have been working from home or entrepreneurs had conducted their businesses in the same way, very frequently without training or the necessary technological tools. In this new scenario, a series of questions are born, for example: how has this transition impacted people's lifestyles? Has your perception of well-being improved or worsened? How has your adaptation to remote work or remote entrepreneurship? Is new kind of entrepreneurship necessary in this remote-digital context?

This series of questions lead us to reflect on well-being, your individual perception and your relationship with work. And for this, it is necessary to define this concept. The perception of well-being is a complex and multifactorial construct, in its historical fabric it is mostly approached by psychology and behavioural sciences. From these areas of knowledge, well-being *is defined as the affective balance, which is obtained by subtracting the frequency of positive emotions and the frequency of negative emotions and perceived satisfaction*

(Diener and Fujita, 1995). That is, the perception of well-being is a subjective concept related to three main characteristics (Wright and Cropanzano, 2000). The first one, as a phenomenological event, that is, a person perceives that well-being, when they think they are in a sensation of that type. Various investigations in this sense point to the perception of well-being as the sensation of being touched in intimate existence (Wright and Cropanzano, 2000; Lundin, Berg and Muhli, 2013). For Lundin et al; (2013), the phenomenon of well-being is deduced by three components: 1) *The feeling of freedom in elections*, 2) *The feeling of pleasure and* 3) *The feeling of closeness to someone or something*. The second characteristic (Wright and Cropanzano, 2000) involves *emotional conditions*, that is, people who perceive well-being are more oriented towards *positive emotions* than negative ones. Third, well-being is defined as a *global evaluation* not only as a part of life, but as a whole (Diener, 1994).

Although, in the theoretical discussion reviewed, well-being seems an individual phenomenon, some authors describe how certain social and contextual situations can facilitate or limit the full development of well-being and the self-motivation that originates it (Ryan and Deci, 2000; Lundin, Berg and Muhli, 2013).

The COVID-19 pandemic has been the *black swan* (Taleb, 2007) of the millennium. It has generated a series of changes in individual and collective decisions in a very short time. Although motivated by precautions in health matters, we cannot ignore the economic, mental health and educational implications that have been generated within the framework of the quarantine period or shelter at home.

For a part of the world population, the home has become a saturated space, where family life, the school room and the office dialogue in a 24/7 dynamic that has had an impact on the emotional development of children, young people (Liu et al., 2020) and for those who adapted their work to virtuality, remote workers (Como, Hambley and Domene, 2020).

Although the perception of well-being has been an issue analysed in the past by the landscape of work (Harter, Schmidt and Keyes, 2004; Netz et al., 2005), in the context of COVID-19, it becomes a strategic element and key to maintaining three elements that shape a human community: *job satisfaction, health care and job performance, and family upbringing*. Elements that have been violated in various ways in this health crisis (Chien-Hung, Chen and Chen, 2017; Möhring et al., 2021; Özmen et al., 2021).

This crisis situation makes palpable the need not only to rethink the issue of well-being as individuals or societies, but also to rethink leadership in this new paradigm in organizations (Deloitte, 2020). A digital leadership seems to be an option, although a leader who possesses broad digital skills (hard-skills): *use of connectivity, open-source technology, mobile devices and platforms* (Damayanti and Mirfani, 2021) is fundamental in this paradigm, both for workers or entrepreneurs. Options that balance the use of technology and the appreciation and meaning of being human (soft skills) will be in the short term a trend in the world of work, especially in the work-life balance (Nam, 2014) and on the borders of both worlds (Currie and Eveline, 2011) to avoid health, emotional or intrusive problems (Adisa, Gbadamosi and Osabutey, 2017).

A *human-technological leadership* seems an option that arises to promote balance even in workplaces or entrepreneur ideas, this proposal seeks to balance between the human and the digital, but primarily it is guided by a *deep and solid sense of well-being and ethical bases in the execution of its actions and results, in the motivation of their teams and individuals and in the sustainable and digital vision of the organizations of the future*. This crisis of the COVID-19 pandemic has taught us that we are fragile, at an individual and organizational level and in this accelerated learning process in which extraordinary technological and managerial adaptations have been experienced (Bartsch *et al.*, 2020). It is time to pause and provide time for analysis and reflection to weave the foundations of a gradual transition towards human-technological leadership in the birth of future digital organizations.

### **3 Wellness and Remote Work and Entrepreneurship**

The relationship between individual and collective well-being within an organization becomes a construct to be addressed, especially for those organizations that seek to excel in their industry by developing a competitive advantage in their staff (Porter, 2007), especially in this time of redefinition of the business world (Donthu and Gustafsson, 2020). Rethink the occupational risks that may exist from remote working, the medical costs of saturated workers, the benefits of the time favoured in physical care by the workers and even the investment in adequate infrastructure, so that there are elements for think in self-care and it will become more than ever an added value to attract and keep talent in an organization or to create an entrepreneur business unit.

This relationship between remote work – entrepreneurship and well-being results in the discussion of two key elements for *a new kind of organizations*: 1) the need for labour strategies to favour the *well-being of the staff* and 2) a *trained workforce* with skills necessary for this PostCOVID-19 economy: *Adaptability in new digital skills for remote work, flexibility in product and service distribution chains and a high capacity for resilience in the face of uncertainty. If these two elements are not found in the labour market naturally, labour phenomena such as the United States could be repeated in other countries* (Olmo, 2021).

Speaking very generally, business owners and small-medium entrepreneurs have going back to the core of their entrepreneurship (Liguori and Winkler, 2020). Even though for the digital entrepreneurs was the opportunity to update some skills in digital issues and create new orientations of their business across the globe. *Adapt or die*, is something related with this scenario, however the adaption process should be pointed to increase the wellness of entrepreneurs and living conditions.

#### **4 Method**

To evaluate the effects of the shelter at home derived from the pandemic on people's perception of well-being, the future implications in remote work dynamics, and the possibility of new leadership appearing in this scenario, a survey of 587 was carried out. People from the state of Guanajuato, México who were of legal age, who were isolated in their homes during the period August-December 2020. The items were adapted from the University of Texas Project called The Pandemic Project (Pennebaker, Ashokummar and Vergani, 2020) and were placed in a form for electronic filling. It was shared by digital means to members of the Guanajuato society for the most part.

To verify and validate the information and the model to evaluate the perception of well-being, a system of structural equations by partial least squares (SEM-PLS) was used (Hair et al., 2010, 2012, 2018; Iacobucci, 2010). The research model has six reflective dimensions (see Figure 1) (Becker, Klein and Wetzels, 2012) and two categorical variables referring to work and educational level. These variables allow us to portray a part of the phenomenon experienced by the participants in their homes in this period and discuss the results in light of the future implications for remote work and new leadership.

It was ensured that the structure of the instrument was careful with the sensations of the participants, for this reason an informed consent of the participant was included, where the items, scope and the response process were explained. The instrument is intended to be an informed, brief and concise document for the participants. Derived from the theoretical review (Cotton and Hart, 2003; Harrison and Stephens, 2019; Como, Hambley and Domene, 2020; Pennebaker, Ashokummar and Vergani, 2020) the dimensions in which the instrument was structured corresponded to (see Figure 1):

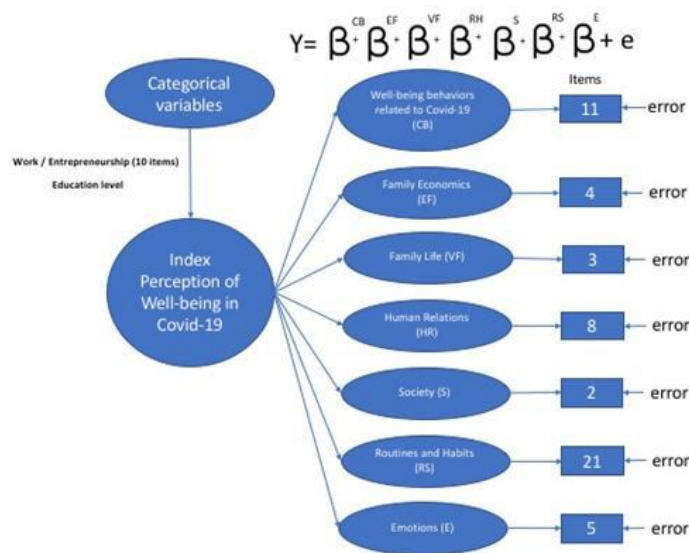

Figure 1. Research Model.

The evaluated dimensions are explained below in these three categories:

a) *Well-being behaviours related to COVID-19*. In this section, 11 questions were asked about elements related to well-being based on the COVID-19 scenario, the levels of concern of the people surveyed about COVID-19 and the time spent in shelter. In the first question, the opportunity opens up for an open response where people express: how do they feel? Where the opportunity to collect the stories of the participants opens.

b) *Adaptation to Remote Work-Entrepreneurship*. In this section, 10 guiding questions were asked about the type of work they have or if they have an own business, how they have carried it out so far, whether they have additional income

options and the modality in which they have carried out their work-business at this time (face-to-face, mixed or virtual). This allows us to know the level of adaptations of the types of work-business that have been done by the surveyed population.

c) *Well-being habits (Family Economy, Family Life, Human Relations, Society, Routines and Habits and Emotions)*. In this section, 43 guiding questions were carried out around the changes in behaviour and habits that the participants have experienced from the shelter at home in the dimensions of: Family Economy, Family Life, Human Relations, Society, Routines and Habits and Emotions. The results of this section allowed us to know the changes in the perception of well-being for the surveyed population.

From the above, 6 hypotheses were derived for this research that correspond to describing the well-being perception construct and its behaviour in reflective and categorical dimensions (Becker, Klein and Wetzels, 2012; Simonetto, 2012):

*Hypothesis 1. The dimension of Well-being Behaviours related to COVID-19 is positively and significantly reflected in the perception of well-being.*

*Hypothesis 2. The dimension of Family Economy is positively and significantly reflected in the perception of well-being.*

*Hypothesis 3. The dimension of Family Life is positively and significantly reflected in the perception of well-being.*

*Hypothesis 4. The Human Relations dimension is positively and significantly reflected in the perception of well-being.*

*Hypothesis 5. The Routines and Habits dimension is positively and significantly reflected in the perception of well-being.*

*Hypothesis 6. The Emotions dimension is positively and significantly reflected in the perception of well-being.*

The application of the PLS-SEM algorithm was carried out in the SmartPLS® software version 3.3.3 (Ringle, Wende and Becker, 2015), where the type I reflective model was designed for the 587 observations.

In the case of this type of model, the evaluation begins with the loading of the indicators. Loads greater than 0.700 indicate that the construct explains at least 50% of the variance of the indicator, which is why the indicators less than this parameter were removed. In the *dimension of well-being behaviours associated with COVID-19 (CB)*, items 7A (0.561), 7B (0.499) and 7C (0.556), related to hygiene and prevention measures, were removed. In the *Human Relations (HR) dimension*, the items that showed this characteristic were 21A (0.569), 21E (0.615),

21G (0.683). In the *dimension of Routines and Habits (RS)*, the items withdrawn corresponded to 24A (0.140), 24B (0.201), 24C (0.509), 24D (0.478), 24E (0.124), 24F (0.347), 25A (0.269), 25B (0.264), 25C (0.253), 25D (0.312), 25E (0.350), 25F (0.322), 25G (0.294), 26F (0.462), 26G (0.579) and 26H (0.335) relative to management practices from stress, changes in perception of reality or changes in purchases and time online. In the *Emotions dimension (E)*, items 27C (0.584), 27D (0.369) and 27E (0.373) corresponding to acting with violence and irritation were removed due to their burden (see Figure 2)

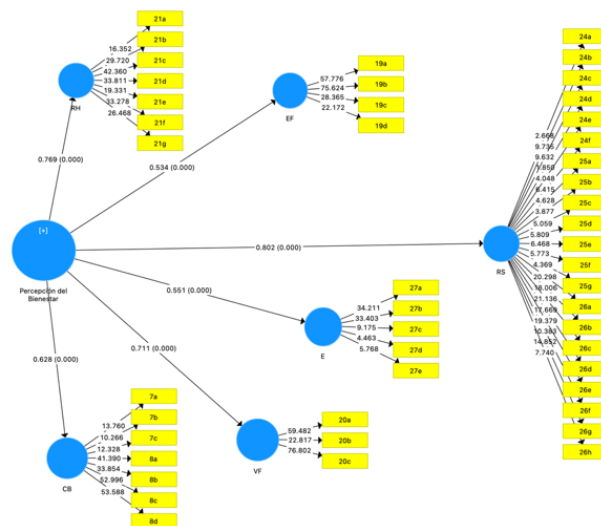

Figure 2. Research Model in SmartPLS  
Own elaboration from the information obtained by SmartPLS® software.

The next step in the validation of the model is to analyse the internal consistency reliability for the use of SEM-PLS is determined through the composite reliability, which determines that for exploratory studies the margins of 0.600 to 0.700 are acceptable, parameters between 0.700 and 0.950 are considered satisfactory and excellent and those greater than 0.950 are problematic.

The dimensions obtained scores greater than 0.850 and less than 0.950 (see table 1).

Table 1. Measurement settings of the Reflective Perception of Well-being model.

Construct / Dimensions		Composite reliability	AVE
Perception of Well-being	Wellness Behaviors related to Covid-19 (CB)	0.925	0.755
	Emotions (E)	0.948	0.901
	Family Economy (EF)	0.873	0.633
	Human Relations (RH)	0.852	0.591
	Routines and Habits (RS)	0.855	0.543
	Family Life (VF)	0.858	0.670

Source: Own elaboration from the information obtained by SmartPLS®

The next validation step corresponds to convergent validity, which is determined by the Average Extracted Variance (AVE). This indicator is calculated by the mean of the square of the loads of all the indicators associated with this construct (Sarstedt *et al.*, 2014). An acceptable AVE corresponds to 0.500 or greater (see table 1). After the previous tests of the model, it is necessary to determine the discriminant validity. The above determines how different a construct is from others in the model. The most conservative way to do this is through the Fornell-Larcker criterion (Hair *et al.*, 2014) (see Table 2).

Table 2. Fornell-Larcker criterion

	<b>CB</b>	<b>E</b>	<b>EF</b>	<b>RH</b>	<b>RS</b>	<b>VF</b>
<b>CB</b>	<b>0.869</b>					
<b>E</b>	0.068	<b>0.949</b>				
<b>EF</b>	0.303	0.208	<b>0.796</b>			
<b>RH</b>	0.320	0.244	0.319	<b>0.769</b>		
<b>RS</b>	0.277	0.450	0.245	0.413	<b>0.737</b>	
<b>VF</b>	0.323	0.240	0.244	0.603	0.441	<b>0.819</b>

Source: Own elaboration from the information obtained by SmartPLS®

Evaluation of the structural model is necessary. For this, the following are evaluated: a) determination coefficient ( $R^2$ ), b) cross-validation redundancy ( $Q^2$ ) and c) path coefficients (Sarstedt et al., 2014) (see table 3).

Table 3.  $R^2$ ,  $R^2$  adjusted and  $Q^2$  structural model.

	$R^2$	$R^2$ <i>adjusted</i>	$Q^2$
CB	0.342	0.340	0.249
E	0.231	0.230	0.201
EF	0.286	0.284	0.173
RH	0.582	0.581	0.335
RS	0.545	0.544	0.288
VF	0.517	0.516	0.337

Source: Own elaboration from the information obtained by SmartPLS®

The  $R^2$  indicator is a measure that allows us to predict the results of the model. Values between 0.660 and 0.330 indicate a moderate explanatory value of the model. The dimensions that possess this characteristic correspond to *Human Relations (HR)*, *Routines and Habits (RS)* and *Family Life (VF)*. Another way to evaluate the predictive relevance of the model as a measure of precision is  $Q^2$ , as a measure, values greater than 0 indicate an acceptable predictive value (Hair et al., 2014; Sarstedt et al., 2014).

Table 4. Hypothesis, path coefficients, t-value and significance of the structural model

	<b>Relationships and Hypotheses</b>	<b>Path coefficient</b>	<b>t values</b>
<i>Index of Perception of Well-Being in Covid-19 pandemic (iWB-19)</i>	Hyp 1. Perception of Well-being -> CB	0.584 ***	15.283

\*\*\*  $p < 0.001$ . Source: Own elaboration from the information obtained by SmartPLS®

Bootstrapping was carried out with 5,000 subsamples (Hair *et al.*, 2014) obtaining six relationships between the variables (see table 4). Through *the results it can be observed that the perception of well-being is reflected in a positive and significant way with a higher coefficient by the dimensions of Human Relations (HR) 0.763, Routines and Habits (RS) with 0.738 and Family Life (FV) with 0.719.* This is undoubtedly a finding in this pandemic time, which will have implications for the welfare adjustments for remote workers or remote entrepreneurs in purely digital organizations.

## 5 Results

The model and the results indicate that the lockdown process derived from quarantine changed people's perception of well-being and concerns. Descriptively, 17% mentioned feeling very worried about losing their job and 40% mentioned that the confinement derived from the quarantine impacted on their human relationships with their family, friends and co-workers. According to a multi-group analysis, *women and people with a basic level of education reflected changes in the perception of their well-being in the dimension of Family Economy (FE).*

The results indicate the *economic impact of this pandemic in populations with a lower educational level and with a gender bias*, since the women participating in the survey were the most affected in the life-work balance than men. This trend corresponds to other studies conducted during the pandemic (Yildirim and Eslen-Ziya, 2021).

The dimensions analysed had different impacts. Descriptively, 19% of the surveyed population felt angry and irritated and approximately 5% mentioned having acted with violence or abusing alcohol or tobacco. In the analysis of

relationships in the model, it is shown that the *participants with a higher educational level reflect a greater effect of this dimension on the perception of well-being*, that is, it could be inferred that at a higher educational level the changes in the *Emotions dimension* would have a greater relevance in the perception of the individual's well-being (see Table 5). Emotional regulation has been a very important factor for proper work-family management during this pandemic (Restubog, Ocampo and Wang, 2020), especially for remote workers (Wang *et al.*, 2021).

This is a relevant finding for the research, it could be inferred *that the higher the worker's education, there is a greater possibility of exposure to emotionally exhausting tasks or those that require high intellectual concentration skills*, so differentiated strategies would be a good care option. Workers with a higher educational level develop expectations in their work and especially in the care that the organization should take for their personal well-being (Zapf, 2002).

Table 5. Factor Loads of the Well-Being Perception dimensions by educational level groups.

	<b>Basic education</b>	<b>Higher and Postgraduate Education</b>
CB	0.572	0.602
<b>E</b>	<b>0.386</b>	<b>0.589</b>
EF	0.529	0.532
RH	0.744	0.788
RS	0.716	0.753
VF	0.732	0.720

Source: Own elaboration from the information obtained by SmartPLS®

Regarding the sense of community, 35% of the participants answered that the confinement will unite people more and 34.75% mentioned having offered help to other people in this period. Economic changes are the main concern of the participants, 80.6% mentioned not having an extra income during this period of confinement and 8.5% could not perform remote work according to the conditions of their work and 25% continued doing their work 100% in person.

This is an important indicator of the process of adapting from a purely face-to-face job to a remote one.

According to the descriptive analysis, 41.8% of the participants mentioned their ability to adapt their work to virtuality, however 38.3% could not migrate to a remote environment and for 8.6% the scenario was compromised for their economy, since they mentioned having lost their job in this period.

The relationship model demonstrated its reliability and validity (see Tables 1, 2 and 3) thereby checking the hypotheses raised through the validated model (see Figure 3). This is an important finding, since it allows an exploratory panorama of the way in which the perception of the well-being of individuals was impacted by the shelter at home and the construction of the concept of *what is perceived as well-being in this period*.

Although the relationship between well-being and management has been addressed and studied previously (Pagán-Castaño, Masada-Moreno and Santos-Rojo, 2020) during this pandemic, social distancing measures, economic pressures and emotional stress that have been experienced have placed this concept with a greater presence on the agendas of organizations or new entrepreneurs, especially for those who seek to *move to a purely digital and remote model and who are in search of training and attracting leaders or intrapreneurs who understand this new paradigm*.

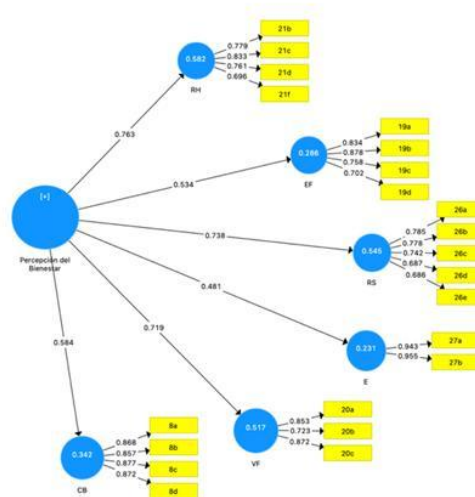

Figure 5. Path model validated about the effects of COVID-19 on Index of Perception of Well-Being in Covid-19 pandemic (iWB-19)

Source: Own elaboration from the information obtained by SmartPLS®.

The model validated in this study describes the perception of well-being as a variable that can be measured and interpreted by this concept with a greater presence in the agendas of organizations and new entrepreneurs, especially for those seeking to move to a purely digital and remote model.

For the surveyed population, the elements that allow them to have a perception of their individual well-being are mainly reflected in the dimensions of: *Routine and Habits (RS)*, *Family Life (VF)* and *Human Relationships (HR)* (See Table 6) . This is a finding that will have implications for economic and organizational recovery in the post-pandemic era. These results will provide information for the design of present and future strategies to reduce impacts in these dimensions.

## 6 Conclusions

In summary, *the confinement has generated various emotional conditions among people, especially in the perception of well-being*, especially for remote workers and entrepreneurs. Changes in work dynamics and adaptation to remote work mediated by digitality have been the challenges that organizations have had to

face immediately. However, the implications that arise from will have long-term impacts.

The conclusions of this research work will revolve around three main points, the first of them:

1) *Well-being: a key point in remote work.* The promotion of habits of physical and mental well-being are fundamental in the organizations of the future, especially for remote workers, adaptation towards digitality implies resilience (Hite and McDonald, 2020), space for the care of emotions and for the maintenance of human relations. In this new paradigm, the development of leadership with a focus oriented towards caring for well-being and minimizing technological attention will be a latent element in the training of new executives. Organizations that achieve this process of integration in their mission, vision and values will develop a competitive advantage among their competitors. Taking back a value to the human relationship from the dignity at work and not simply for the market value, one of the dogmas of the destructive hyper-capitalism that we face in this era (Byung-Chul, 2017).

2) *Human-technological leadership: Dignity and Balance.* The challenges involve new leadership skills in digital environments, educational inclusion in the digital world, especially for emerging economies, and life-work-well-being balance in purely digital environments (Felstead and Henseke, 2017). This balance manifests the urgent need for a new leadership to emerge in this paradigm. The denominative proposal of human-technological leadership seeks to be a space for the union of skills that allows a transition of purely digital organizations with a high sense of the human dignity of their collaborators, leaders and clients. An ecosystem primarily human, rather than technological; an opportunity to recover a different use of life, of work that allows a playful and contemplative use that is not simply drowned in doing (Byung-Chul, 2020), but in the promotion of being. *Imagining a leader or entrepreneur who promotes a balanced human-technological relationship between the work relationship and the self-care of workers with a high sense of dignity in the digital organization seems utopian, however, it is a model to which we should gradually orient ourselves.*

3) *Digital Organization: Remote Work and Leadership.* Digital organizations develop in terms of complexity and quantity in recent years, undoubtedly the pandemic allowed to promote more digital services in daily life. Integrating in these organizations the technological part in balance with a leadership with a

high sense of life-work balance will be able to orient better results in the medium term.

The transition to digital organizations needs leaders who adapt to these new contexts and respond with the ability to harmonize between technology and the transition to a more humane organization, aware of dignity and socially interconnected with other organizations locally and globally.

### Abstract

Companies are called to cope with increasingly complex challenges. Among all, the reduced amount of resources available on our planet forecasts a dramatic future scenario. Circular Economy (CE) is one of the most promising strategies to manage resources efficiently. But also, the application of knowledge management in ensuring effective transition into a circular economy by developing a circular business model as an alternative to the conventional linear economic model is under-investigated. Knowledge coordination, creation, and dissemination capability of a firm are essential in developing the green industry. Furthermore, the knowledge creation, transmission, usage and sharing capabilities of a firm are critical to developing a sustainable sector. This article adopts a literature review approach to gain circular economy and knowledge management components and then shift to a lexical-analytical system that establishes the link between knowledge management and circular economy.

**Keywords** - Circular Economy, Circularity, Knowledge Management, Lexical Analysis, Principal Component Analysis

## 1 Introduction

One of the challenges in the current socio-economic paradigm for organizations is to adopt resilient strategies to cope with uncertain environments (Sheffi, 2005; Lengnick-Hall, Beck, 2005; Bhamra et al., 2011; Gilly et al., 2014; Linnenluecke, 2017; Korber, McNaughton, 2018; DesJardine et al., 2019; Conz, Magnani, 2020; Hillmann, Guenther, 2021). Uncertainty can result from different sources, such as rapid technological changes, the proliferation of information, and threatening resource consumption. Considering this situation, organizations can only remain competitive and achieve long-term success by confronting uncertainty and adopting sustainable information and resources management models (Van Fan et al., 2019).

"We're drowning in information, but starving for knowledge" (Miller, 2007). Therefore, there is a significant need for systematic management of relevant information obtained from the overabundance of data in the external and internal environments, as well as for their analysis and usage to create holistic knowledge of an organization (Gregoris et al., 2001; Diakoulakis et al., 2004; Ioannis et al., 2004). Another layer of this process starts afterward by creating, sharing, using, and managing an organization's knowledge and information. This stage, called knowledge management, refers to a multidisciplinary approach to achieve organizational objectives by making the best use of knowledge.

On the other hand, to eliminate waste and to strive for the continual use of resources, circular economy-based systems employ reuse, share, repair, refurbishment, remanufacture and recycle to create a closed-loop system, minimizing the use of resource input and the creation of waste, pollution and carbon emissions (Ellen MacArthur Foundation, 2012; Rashid et al., 2013; Su et al., 2013; Ghisellini et al., 2016; Jawahir, Bradley, 2016; Lieder, Rashid, 2016; Blomsma, Brennan, 2017; Murray et al., 2017; De Jesus, Mendonça, 2018; Govindan, Hasanagic, 2018; Korhonen et al., 2018a; Agyemang et al., 2019; Kumar et al., 2019; Pieroni et al., 2019; Geissdoerfer et al., 2020; Mura et al., 2020; Alhawari et al., 2021).

Despite the increasing attention towards the material resources in companies' annual reports and investigating the most efficient usage for them as the application of circular economy, there is still a considerable lack of consideration on efficient management of informational resources. While efficient management of information and knowledge can also contribute to costs and profitability, some

knowledge management components can also have significant social effects. Especially in the recent paradigm in which companies are bombarded with an intensive amount of information and knowledge-based technologies, knowledge management can generate sustainable competitive advantages. Moreover, physical and intangible resources are entangled in many aspects and we can't progress in one of them without simultaneous progression on the other. However, upon assessing state of the art, the lack of studies on the contribution of the two kinds of resource management (physical and intangible), circularity and knowledge management, is detectable.

To fill this gap, in this article, following a brief literature review of both topics, we introduce several components for each of the two strategies mentioned above (knowledge management and circular economy). As for the first one, these components are based on the "knowledge management system process" (Chandra, 2019), including knowledge generation, knowledge using, knowledge transferring, and knowledge sharing. From the perspective of a circular economy, the main components are waste management (Romero-Hernández and Romero, 2018; Nelles et al., 2016), renewable energy (Olabi, 2019; Tsuyama, 2020), reuse of resources (Llorente-González and Vence, 2020; Goyal et al., 2018) and recycling (Haas et al., 2016; Di Maio, Rem, 2015).

Taking the 2020 version of EURO STOXX 50 list of the leading companies of the Eurozone as the basis of the analysis, we will parse the non-financial reports of those companies to assess them for the presence of the aforementioned components of both circular economy and knowledge management. By proceeding deductively, we will fix the categories before the assessment process, and then we will scrutinize the non-financial reports to code everything related to the categories. In this way, we will evaluate how many of the categories of both circular economy and knowledge management are covered in the non-financial reports of each company in the dataset. Then we will move from the qualitative assessment to the mixed methods analysis to understand the connection between the presence (or absence) of the categories in the individual non-financial reports and the size and liquidity of related companies' stocks. We will test whether there is a statistically significant difference between the expected frequencies and the observed frequencies in a set of contingency tables for categorical information using chi-squared tests. For the quantitative measure, we will find in the reports a regression analysis will be performed to understand the possible nature of the relationship between the willingness of a company to adhere to the principles of

circular economy/knowledge management and their scores for the EURO STOXX 50 index. The coded segments will also be visually explored using the MAXQDA Document Map to uncover how companies in the list are distributed according to the attention they show in their reports to the issues of both circular economy and knowledge management.

In this manner, we strive to fill the significant research gap regarding the relationship between circular economy and knowledge management and understand how the two may contribute to a company's financial success. We think our results may be useful to managers and scholars. Moreover, it sheds additional light on the importance of the potential that knowledge management and circular economy have to "shield" companies from the pitfalls of uncertain times.

## **2 Literature Review**

### ***2.1 Knowledge, knowledge management and knowledge management system process***

The enterprise is a social system characterized by continuous changing processes that arise from the need to respond effectively and efficiently to the internal and external environment's self-generative and renewal drivers. A company can improve its competitiveness only if it possesses these capabilities, legitimize itself, increase its social role and, above all, pursue the systemic goal of creating sustainable value. From this point of view, the enterprise is considered a collection of resources (Penrose, 1959) whose endowment can strengthen the process of creation and dissemination of value, as evidenced by the Resource-Based View.

Resources, i.e., the productive assets that the company controls directly or indirectly, are at the basis of the autopoietic process that fuels its evolution. In this context, an essential role is played by the intangible assets of the value chain (Drucker, 1999) resulted from numerous factors, such as the revolution generated by the information age, the change in the international economic scenario, the challenges arising from increasing global competition, the complexity of relations with stakeholders, the growing importance of human capital—especially if highly specialized, the need for the company to grow and develop in an increasingly dynamic and complex economic context, the emergence and

establishment of the so-called "knowledge economy", and the widespread acceptance of innovative techniques of "knowledge management".

These are mainly endogenous elements, usually not transferable or separable from the company system, whose contribution to the creation of value is manifested in the performance differential that the company itself manages to achieve compared to its competitors. These resources tend to sediment over time through various processes within the systemic entity to sustain the acquired competitive position (Dierickx and Cool, 1989). Moreover, these resources generate virtuous developing circles thanks to their use, such as intra/inter-systemic relations, learning, the diffusion of the company's culture, reputational capital, image and above all, knowledge. However, resources tend to perish if the company does not sufficiently manage them. Because if not continuously monitored, fed, renewed and preserved, they can be overtaken by innovations generated by competitors.

In this context, the process of value creation, which represents the meaning of the existence of the enterprise, can be introduced as a process of knowledge creation perceived as the set of cognitive schemas that allow the organization to function (Nonaka and Takeuchi, 1995; Grant, 1996; Vicari, 2008; Roblek et al., 2014).

In other words, enterprises can implement their operational processes because they hold adequate knowledge regarding the realization of products, new technical solutions concerning processes, interpretation of signals from the context, management of exogenous and endogenous relations, and search for new development paths.

In this way, according to Vicari (2008), the economy changes its nature from the science that focuses on the optimal allocation of scarce resources to the science of regeneration and use of growing cognitive resources since they are unlimited and reproducible without cost.

Knowledge then generates a dynamic and collective process, which increases the contributions of individuals because it is transformed from "individual assets" to "organizational assets" (Tardivo, 2008; Kianto and Waajakoski, 2010). This implies an evolutionary dynamic of firms that shapes supply, organizes structures, and generates resources based on the self-generative capacity of knowledge that grows and enhances with use and can be employed indefinitely without running out (Davenport and Prusak, 1998; Rullani, 2004; Brinkley, 2006).

Based on these assumptions, according to Manesh et al. (2021), knowledge is a key resource for gaining sustainable competitive advantages, concretely translated into more efficient business processes and quality improvement, as well as increasing firms' ability to recognize novel solutions and develop products that meet their customers' needs.

However, as pointed out by Tardivo (2008), "the management of the process of creating new knowledge has the definition and sharing of a value system as a fundamental prerequisite, and becomes essential for a company that wants to be and remain successful."

Moreover, knowledge requires the adoption of flexible organizational structures where interactions play a relevant role with exogenous entities and exchange of information and resources, highlights the use of so-called networks. The economy and the market become "passages without territory" where the classic supplier-customer relationship requires the establishment of "alliances" with the transition from an individualistic/hierarchical logic to one focused on interaction and exchange (Tardivo, 2008).

The network economy considers integration as a strategic tool that influences knowledge production and the increasingly important role of information and critical knowledge holders. Indeed, the network facilitates the exchange, co-production, sharing and replication of knowledge, aiming at innovativeness (Audretsch et al., 2020). However, achieving positive consequences from access to external knowledge requires implementing internal innovation practices along with balancing investments in internal and external knowledge (Enkel et al. 2009; Agarwal et al., 2010; West and Bogers, 2014; Tavassoli et al., 2017; Santoro et al., 2018; Audretsch et al., 2020).

Knowledge, according to McElroy (2003), can be metaphorically included in "containers" distinguished in agents (individuals and groups), which highlight subjective forms of knowledge, and artifacts (documents, books, computer systems, etc.), which instead represent objective forms of knowledge.

The logic of the "containers" can also be found in a study by Vicari (2008) who has broken it down into five types: physical capital, organizational structures, routines, individuals and, as far as trust is concerned, the type of relationships implemented by the company.

Depending on the degree of sharing inside and outside the organization, we can determine the value of knowledge. However, in the second case, the appropriate transfer restrictions necessary to avoid the risk of industrial

espionage must be taken into account (Brinkley, 2006). However, the issue that companies must face concerns the modalities of knowledge accretion that usually occurs in various ways (Arrow, 1962; Cohen, Levinthal, 1990; Vicari, 1998; Bhatt, 2001; Tardivo, 2008). These are:

- learning by doing: knowledge is developed by the manufacturer or component supplier during the design and production activity;
- learning by using: knowledge is accumulated through the use of facilities, equipment or products;
- learning by searching: knowledge is developed through the intentional search for new products or process solutions;
- learning by interacting: knowledge is increased through systemic interactions that are established between a multitude of actors, public and private, involved in the process of innovation and dissemination, which to be sources of information, are equipped with different skills, knowledge, skills and resources;
- specific investments of accretion;
- imitation;
- acquisition from the outside through a continuum of opportunities, ranging from the purchase of consulting services to hiring personnel and acquiring an entire company.

Therefore, knowledge as a renewable resource (Brinkley, 2006), is the basis of innovation processes, in which the governing body plays an essential role that must be oriented towards the coordination, sharing and development of the company's knowledge assets (De Long and Fahey, 2000; Yew Wong, 2005; Kavanagh and Ashkanasy, 2006; Singh, 2008; Schumpeter, 2010; Nguyen and Mohamed, 2011; Pinho and Rego, 2012; Donate and De Pablo, 2015; Dayan et al. , 2017; Singh et al., 2021).

Gaimon and Bailey (2013) pointed out that the different performances achieved by firms can be attributed to varying levels of knowledge possessed and exploited for new or enhanced goods and services, new markets, new technologies, new manufacturing methods, and new forms of organizational design.

According to Vicari (2008), "the added value and competitive advantage today lie in the ability to originate new knowledge, in order to increase its value, to appropriate knowledge originated by others." Therefore, since knowledge is inherent in people, it is converted from tacit to explicit and vice versa through the

process of socialization, externalization, combination, internalization (Chandra, 2019). To sustain the acquired competitive advantage over time, however, the knowledge process is circular. Tacit and explicit knowledge is a unity that cannot be separated in the knowledge management process (Chandra, 2019).

In this way, it is possible to understand how knowledge is created, shared/transferred, acquired, stored/retrieved, and applied throughout an organizational system (Hedlund, 1994; Manesh et al., 2021). Indeed, through knowledge management, one can facilitate access to external information and knowledge, including their involvement in the value chain (Cohen and Levinthal, 1990; Davenport and Prusak, 1998; Bandera et al., 2016; Raudeliūnienė et al., 2018).

From a strategic perspective, knowledge management represents "organizational processes that seek a synergistic combination of information processing capabilities and the creative and innovative capacity of people" (Tardivo, 2008).

Kianto et al. (2016) identified the following five processes, which, while interconnected, are easily distinguished by the purpose they serve: knowledge acquisition, knowledge sharing, knowledge creation, knowledge codification and knowledge retention. It is also recognized that knowledge management affects the ability of the firm to develop knowledge through the knowledge management system process (Chandra, 2019). These affect the firm's ability to develop effective decision-making processes, including risk management (Rodriguez and Edwards, 2010; Zipperer and Amori, 2011).

Therefore, a knowledge-based economy requires organizational changes in strategies, structures, and management styles (Zack et al., 2009; Roblek et al., 2014; Kianto et al., 2016).

## ***2.2 The role of knowledge management for the transition to the circular economy***

There is widespread recognition among scholars that knowledge represents the pillar on which sustainable development processes are also based (McElroy, 2003; De Marchi and Grandinetti, 2013; Van Reijssen et al., 2015; Martins et al., 2019; Sanguankaew and Vathanophas Ractham, 2019). They also believe that knowledge management is an essential factor in pursuing a sustainable competitive advantage for businesses (Omotayo, 2015).

It is recognized that the implementation of sustainable business also depends on the adoption of a circular economic model (Ghisellini et al., 2016; Geissdoerfer et al., 2017; Formisano, Fedele, 2020; Kavalic et al., 2021). Circularity represents an evolved approach reconciling the maximization of economic goals with environmental and social goals, performed by firms through effective and efficient management of resources (Ellen McArthur Foundation, 2012; 2014; Ghisellini et al., 2016; Lieder, Rashid, 2016; Elia et al., 2017; Kirchherr et al., 2017; Manninen et al., 2018; Formisano, Fedele, 2019). It is, therefore, an opposite logic compared to the linear economic model of "take-make-consume-dispose" or "extract-produce-use-dump material and energy flow" (Fonseca et al., 2018). The linear economic model, which is based on the assumption of the infinity of the resources, raises obvious questions regarding sustainability (Blomsma and Brennan, 2017; Korhonen et al., 2018b). In addition, as argued by Fonseca et al. (2018), resource scarcity fosters higher price value and volatility, which negatively impacts value creation and capture. Moreover, consumer preferences change towards more environmentally friendly products and new sharing models versus ownership models.

The circular economy is credited with increasing business competitiveness and reducing the risks taking, protecting the environment and minimizing the exploitation of scarce resources, contributing to long-term sustainable economic growth with tangible and intangible benefits for businesses and their stakeholders (Ghisellini et al., 2016; Fonseca et al., 2018).

However, the transition from the linear to the circular economic model requires knowledge acquired through a network of stakeholders, including external and internal (Ritzén and Sandström, 2017; Govindan and Hasanagic, 2018; Lahti et al., 2018; Prieto-Sandoval et al., 2019). According to Klapalová (2020), acting in this way, not only new knowledge will be created by new actors and new processes, but also new patterns and new processes will emerge demonstrating how to acquire, capture, analyze, utilize, store and share the knowledge.

However, from Klapalová's study (2020), it emerges that within the theories related to the circular economy, there are still few references to knowledge management.

### 3 Methodology

In order to understand to which extent both circular economy and knowledge management are incorporated into standard practices of best-performing organizations and to uncover nested dynamics between the two novel concepts, we performed a set of extended lexical searches within the non-financial statement of major European companies. The non-financial statements in question refer to the year 2019 (the most recent available at the time of the analysis). The choice of the companies was not arbitrary. The list of EURO STOXX 50 companies was taken as the basis for the analysis. EURO STOXX 50 is the index denoting fifty of the largest and most liquid stocks of the Eurozone. In this way, besides hindering the arbitrary selection, we were sure to analyze only the undoubted leaders of their respective markets. Indeed, we expected these companies to be the most detailed regarding novel topics of circular economy and knowledge management in their non-financial statements. It is not to say such a selection criterion is flawless. On the contrary, the list of companies seems to be skewed towards French (36%) and German (45%) companies. Nonetheless, as the primary goal of the analysis is the identification of nested dynamics between circular economy and knowledge management initiatives (and not the detailed analysis of their effects in terms of profitability/viability on single companies in the list), the asymmetry of the distribution of single EU states was not considered relevant with respect to the outcomes. Three Italian companies have made into the list: ENI, ENEL, and Intesa Sanpaolo.

Fifty individual non-financial reports were then downloaded and subsequently analyzed using MAXQDA qualitative and mixed methods data analysis software. Given the sheer amount of information present in non-financial statements, it was deemed impossible to scrutinize each and every report individually. The extended lexical search tool was instead used to count each and every occurrence of the circular economy and knowledge management-related information in all the documents jointly. For this purpose, a set of keywords was identified accordingly to the exploratory literature review of the previous section of the paper. As a result, two sets of keywords were established, one pertaining to circular economy concepts and another one to knowledge management. More specifically, keywords pertaining to the circular economy domain denoted typical circular economy concepts: recycling, renewable energy, reuse, and waste management. For each concept, several more specific keywords were identified. Additionally, a

more general "circular economy" keyword was also used. Keywords pertaining to the knowledge management domain denoted basic components of knowledge management: knowledge gathering, knowledge sharing, knowledge transferring, and knowledge usage. For each, a set of keywords was also defined accordingly to the literature review carried out in the previous section. Once again, a more general "knowledge management" keyword was also used to account for the additional information on the topic within individual non-financial reports, not pertaining to the specific domains of interest.

MAXQDA extended lexical search allowed us to count specific occurrences of keywords within all 50 non-financial reports for each and every component of circular economy and knowledge management as defined above. Not only specific keywords were searched, but the results were extended to take into account the lemmatization (that is, different inflected forms of words, i.e., "knowledge using" and "knowledge usage"). Moreover, upper case results were separately counted as well. This process resulted in the dataset relating each individual company on the list (rows) with the number of times a specific component of a circular economy or knowledge management (columns), i.e., waste management or knowledge using, is mentioned in the respective non-financial report of the year 2019.

Thus, the amount of effort each individual company is dedicating to issues of circular economy and knowledge management was operationally defined as the frequency with which the main components of circular economy and knowledge management are mentioned in the company's non-financial reports. Such a simplified operational definition has the merits of generalizability given the absence of homogenized indicators to measure the companies' involvement in both circular economy and knowledge management. However, we think the development of such indicators will be crucial in the future, especially given the current need, brought to the light by scholars, of a homogenized framework to which all non-financial statements of companies should adhere. As for now, no one-best way (commonly accepted by every player on the market) to estimate the individual impacts in terms of knowledge management and circular economy initiatives exists.

According to the developed methodology, only the ordinal ranking of companies is, in reality, possible. For example, in total, in Siemens' 2019 non-financial report, different components of the circular economy were mentioned 141 times. On the other hand, ENEL mentioned different aspects of circular

economy 72 times in the same year. That is not to say Siemens is twice more involved in circular economy issues. Assuming the length of individual financial reports to be non-influential, we may only conclude that Siemens is more devoted to circular economy initiatives and issues than ENEL (at least, in its reporting). However, for the purpose of the analysis, we assume certain ordinality do exist, albeit imprecise.

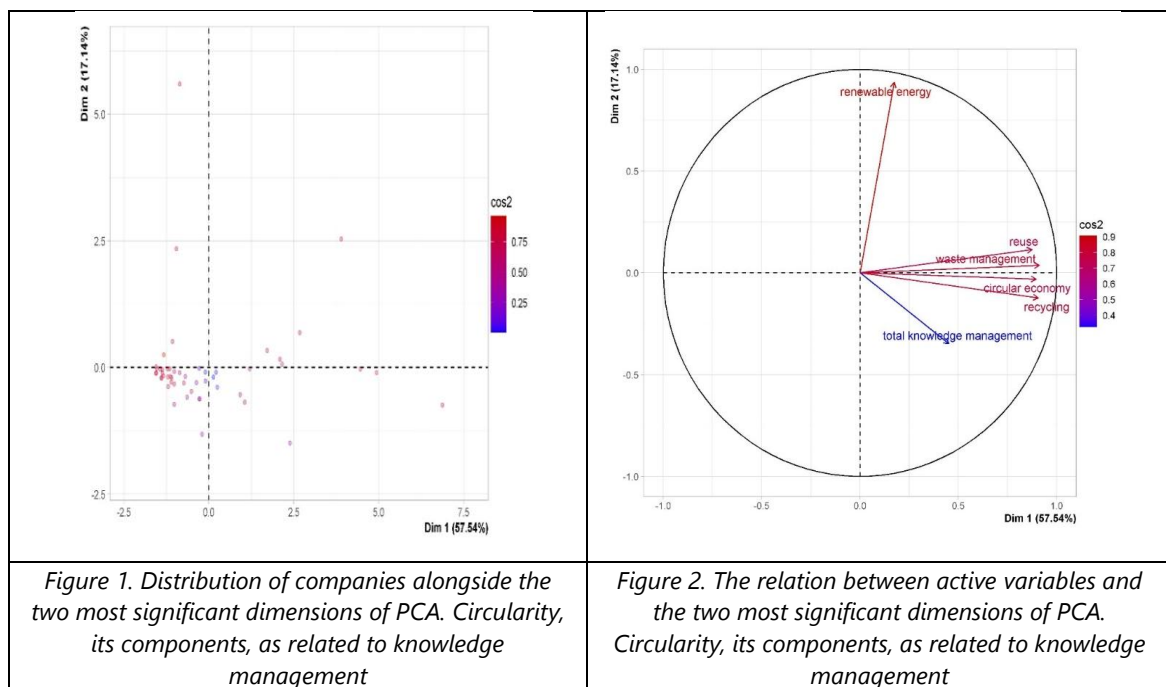

Individual components were then summed across fifty companies. According to the results, Inditex, the biggest fashion group in the world, was the most attentive to circular economy issues during 2019 (293 mentions of circularity in the report), followed by Schneider Electric (265 mentions) and Iberdrola (240 mentions). The fourth and the fifth rank were occupied by Vinci and Telefónica (another French and Spanish company, respectively). For what concerns knowledge management, the first three companies invested in its reporting for the years 2019 were CRH plc, ING group, and Santander (with the total amount of mentions equal to, respectively, 38, 29, and 26).

Two specular principal component analyses were then performed. Firstly, we analyzed individual components of circular economy (circular economy, recycling, renewable energy, reuse, and waste management) jointly with the total amount of mentions for knowledge management (calculated as the sum of individual knowledge management components' mentions). In a specular way, each individual component of knowledge management (knowledge management, knowledge gathering, knowledge sharing, knowledge transferring, and knowledge usage) was jointly analyzed with the total amount of mentions for the circular economy (once again, calculated as the sum of individual circular economy components' mentions).

The first PCA produced six uncorrelated dimensions, with the first two accounting for almost 75 percent of the total variability of the phenomenon. While the interpretation of the second dimension might be interesting, it accounted for only 15 percent of the total variability. Hence, the first dimension resulted in being the only one capable of shedding some light on the dynamics within individual financial reports. Reuse, circular economy, waste management, and recycling variables turned out to be unsurprisingly correlated within financial reports. Total knowledge management was only mildly correlated with the first dimension. However, the correlation was positive. Overall, the presence of circular economy topics in financial reports was a mild predictor of the presence of knowledge management topics within the same reports. One component of

circular economy (renewable energy) was, however, uncorrelated with others. Siemens (northernmost dot on the individual factor map) was the most successful implementor of renewable energy initiatives, according to the frequency of mentions in non-financial reports. From the analysis, it seems that companies think of renewable energy issues as a separate class of problems, not related to the circular economy. Moreover, it seems that tackling the renewable energy issue gives companies a sort of carte blanche for avoiding all other circular economy-related issues equally crucial for both environment and society (reuse, waste management, and recycling). From this point of view, the only truly "balanced" non-financial report was that of Iberdrola, assessing all circular economy-related topics with an equal amount of weight.

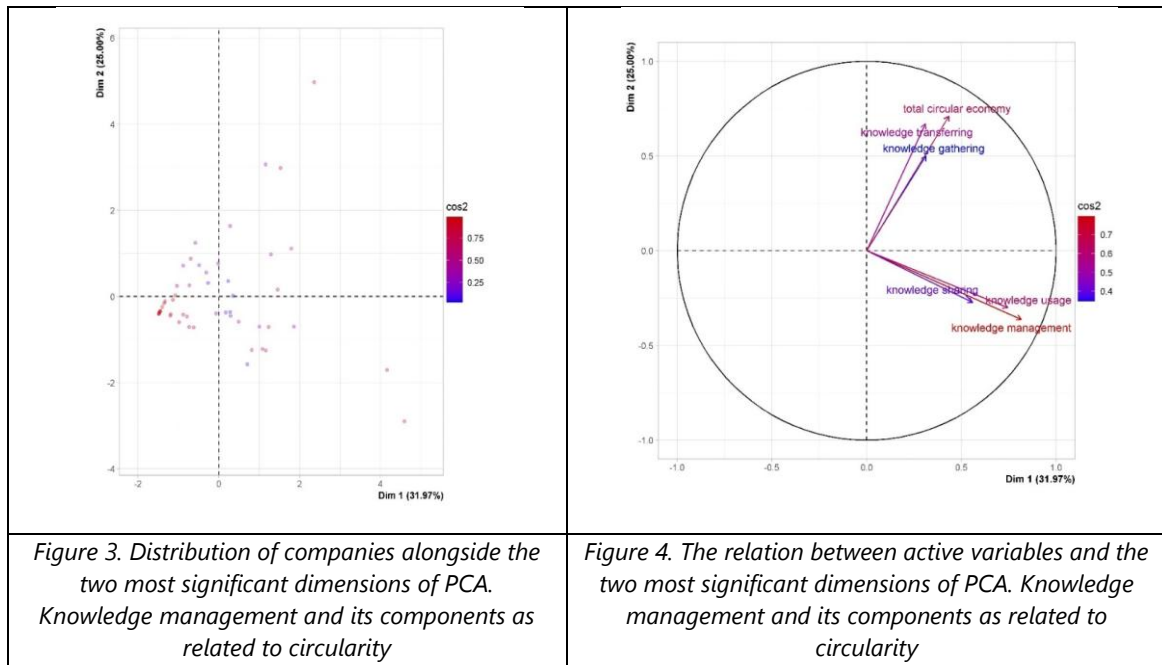

Figures 1 and 2 show the distribution of individual companies alongside the two dimensions and the correlation circle denoting the correlations between single active variables and the two most important dimensions. Cos2 measures the quality of representation of both individual companies and active variables on the map.

Source: Our elaboration

A specular second principal component analysis was performed. This time, individual components of knowledge management were assessed with respect to the total amount of circular economy mentions in non-financial statements of EURO STOXX 50 companies. Once again, the analysis produced six uncorrelated dimensions, and the consideration of the first two dimensions was deemed sufficient for the goals of the analysis. Jointly, the first two dimensions accounted for almost 57 percent of the total variability. This time, the distribution of variability between the two dimensions was more even (32% for the first dimension and 25% for the second). Thus, a more careful interpretation of both dimensions was required. Unlike in the previous case, all the variables were significantly correlated with the first dimension. However, the differences were more marked alongside the second dimension. Indeed, only knowledge transferring and knowledge gathering were positively correlated with the total amount of circular economy keywords mentioned in the non-financial report. It seems that the dynamics of input and output of information, and not the ways in which information is elaborated, are crucial for the due attention to the circular economy initiatives by the companies.

Figures 3 and 4 show the distribution of individual companies alongside the two dimensions and the correlation circle denoting the correlations between single active variables and the two most important dimensions. Once again,  $\cos^2$  measures the quality of representation of both individual companies and active variables alongside the two most important dimensions of PCA.

Source: Our elaboration

#### 4 Discussion and conclusions

As can be deduced from the results obtained in this study, it can be assumed that there is a correlation between circular economy and knowledge management within the assessed companies. However, this correlation is too mild to be reliable. Therefore, PCA was applied to scrutinize the relationship between the components of two concepts. Both circular Economy and knowledge management can be viewed as the two enabling pillars of companies towards uncertainty. The effect of these two on each other is, however, debatable. For example, we may think of a company as systematically applying circular business models without relying on substantial and efficient knowledge management and information flow. To overcome the issue and shift the focus towards the more significant problems within the state of the art, a suggestion is considering information as one of the company's resources, even if not intangible. This approach can boost the application of circular business models on these kinds of assets to elevate both circularity and knowledge management on the same conceptual level and make them equally important for both enterprises and

researchers. Too often, the previous research efforts overlook circularity in knowledge in companies, making it the proverbial "elephant in the room."

The developed methodology allowed us to rank the most prominent companies of the EU according to the number of mentions on knowledge management initiatives and circular economy initiatives on their non-financial reports. Whether the indices of knowledge management and Circular Economy perfectly capture the real situation is left to the further analysis of the "goodness" of fit between operational definitions of knowledge management and circularity (as defined by both indices) and the reality itself. What mattered for us was to obtain a way to rank the companies in the dataset according to some universal criteria to transcend the variables that only matter within the local context. The indices we obtained through the methodology do not (and should not) merit being the most precise or proximal. This comes as no surprise, once again, given how heterogeneous are perceptions of circularity and knowledge management within the state of the art.

Interesting are the results of the regression analysis. The mild positive linear relationship between knowledge management and circularity reveals that the issues of being efficient in managing tangible and intangible assets are connected. Among the specific components of circular economy, only renewable energy seems not related to the knowledge management index. But also, this component does not correlate with circular economy and other components of it. This makes sense, as what seems to count for companies in circularity issues is the efficient management of tangible materials used in the production. To prevent the company from a one-dimensional approach to the circularity issues (by focusing on renewable energy strategies or vice versa), we suggest that new circular business models should be introduced to apply circular economy principles to all groups of assets, including energy, information, material, etc.

As for the contribution of specific components of knowledge management to the circularity of a company, all components are correlated in the first dimension, while along the second dimension, only knowledge gathering and knowledge transferring are correlated with circularity. It seems, applying the principle of circularity on information and knowledge management is more feasible in terms of inputs and output rather than information processing levels. It can be because of the complexity of the knowledge creation procedure in a system. Here we can suggest a systematic approach to the concept of circularity in information and

knowledge, introducing the concept of knowledge circularity in each phase of the knowledge-creating procedure.

From a managerial point of view, the obtained results imply a set of important implications.

Firstly, circular economy issues should not be neglected because of focusing on one or limited components of it as renewable energy in our case. The same is valid for issues related to knowledge management.

Secondly, most big European companies are ready to implement circular economy and knowledge management initiatives; however, only a minority of them scored highly on both indicators. The other ones are clustered near the origin of the axes. From the PCA maps of individual companies, it becomes clear that circularity issues are addressed more frequently than knowledge management issues. We advise decision-makers to consider circular economy initiatives applicable to various assets rather than only materials used in the production. This approach will increase the competitive advantages of the company as well as its profitability.

Thirdly, a presence of a well-developed knowledge infrastructure will undoubtedly benefit the future circular economy initiatives of a company. While planning for both circularity and knowledge management, decision-makers should consider the synergetic relationships between them.

Given that the companies' dataset was not based on a random selection, there is an obvious limitation to the analysis results. The above conclusions and suggestions apply to companies of considerable size in the EU and already adopt knowledge management and circularity initiatives.

The generalization of the results is impossible unless the company in question presents similar characteristics to big generic companies of the European Union.

More in-depth statistical validation of both is needed regardless of the good face validity of the indices of knowledge management and Circular economy. Further replication studies should also be performed to assess the reliability of indices. The principal component analysis revealed itself as a good method to uncover the latent relationship between the indices and formulate the model inductively. However, to validate the model, a more formal and structured analysis of its components is needed. This can be achieved in future studies by applying a more formal and standardized statistical framework, like structural equation modeling.

### **Abstract**

Nowadays, organizations are constantly facing new challenges and threats that may come in various forms, from both inside and outside companies' boundaries. Natural disasters, pandemic diseases, terrorist attacks, economic recession, equipment failures, hacker attacks and human error are just a few examples of catastrophes that present them with new challenges and threats, both inside and outside the company borders. Such events, unpredictable and anomalous, with a huge impact on a large scale and completely unexpected, are generally labelled as Black Swans. The impacts experienced by such events transcend borders and geographic dimensions and negatively affect governments, businesses, transport, economic sectors and people.

The era of digitization represents a new challenge for organizations, a means that could provoke new Black Swans and at the same time prevent others, multiplying the situations in which organizational skills are tested and creating highly competitive environments. Digital can therefore be considered on the one hand a driving force for the development of an organization, on the other a challenge for its resilience and antifragility. Technological change must be analysed not just as regards new business opportunities, but also with respect to potential vulnerabilities.

The aim of this work is to understand the real effects of the digital transformation on the resilient characteristics of organizations.

The research is based on a framework that articulates resilience into its key indicators, in order to create a link between organizational resilience and the trade-off of threats and opportunities caused by digitalization. The resilience transformation framework was used to analyse a case study in which evidence was provided of how the model can be applied in a backwards perspective, in order to understand how digitalization consolidates resilience in a real context and in the middle of the Covid-19 pandemic crisis.

The research shows that in the new millennium the company has transformed its business model, adopting a strategy that places sustainability at the centre of the value chain, making digitalization a key element at all levels and in all processes within company. The results clearly reflect the steps taken and the deep transformation of the company, accelerated in some way by the situations of profound turbulence caused by the pandemic. Indeed, the case study shows a highly connected digital infrastructure with a very high level of resilience.

**Keywords** – Digital Transformation, Case study, Resilience, Risk Management

## 1 Introduction

The environment surrounding organizations increasingly challenges them by posing different threats in various forms. Natural disasters, pandemic diseases, terrorist attacks, economic recession, equipment failures and human errors are just a few examples that help to understand how many different events can undermine the stability and security of an organization and its environment (Bhamra *et al.*, 2011).

From a managerial point of view, resilience can be defined as the ability of individuals or organizations to successfully recover and overcome adverse situations, stressful conditions or unexpected events (Rirkin & Hoopman, 1991; Horne & Orr, 1998; Coutu, 2002). This skill, expected by organizations operating in complex, dynamic and changing contexts, can allow adaptation to situations of crisis, economic, social or political instability, without compromising significantly the organization effectiveness (Starr *et al.*, 2003; Smit & Wandel, 2006; Syrett & Devine, 2012).

Unexpected and unpredictable event, called Black Swan, can have a huge negative impact on the entire organization, the organizations should be resilient and antifragile in the sense that could gain from disorder and even improve thanks to the event they faced (Taleb, 2007; Taleb; 2012).

Digital technologies transform the way we work and live. They provide new business worlds and health systems and augment human sensory systems. The humanity's creation of digital environments has the potential to lead to new forms of interactions with the human environment (Sholz, 2017). Furthermore, mastery of electron and semiconductor physics has allowed for seemingly limitless economic storage capacity, which has made digital tools available to all domains of society (Sholz, 2016). The unlimited accumulation of Big Data by many social media organizations is a major security threat as vast data sets tempt cyber attackers.

As stated by (Helbing, 2015), if on the one hand it tends to undermine the privacy and information security of individuals, on the other hand the extraction of socio-economic data has great potential in terms of acquiring a better understanding of the problems that our economy and society are facing, such as financial instability, lack of resources or conflicts. Without large-scale data mining, progress in these areas borders on the impossible. Our research aims at creating a link between organizational resilience and the trade-off of threats and opportunities caused by digitalization.

The research is articulated as follow. In section 2, we provide a brief review of the theoretical background about digitalization and organizational resilience together with the organizational resilience transformation framework and the research questions. In section 3, the methodology is described in detail and section 4 contains the discussion and conclusions of the study.

## **2 Theoretical Background**

### **2.1 Digitalization**

Digitization is interpreted as "the changes that digital technology causes or influences in all aspects of human life" (Satalkina & Steiner, 2020). The digital age started with the beginning of the millennium (Sholz, 2017) and today digital information and data are covering each domain of the human life. Potentially any action taken by someone will be digitally recorded (Sholz, 2016).

According to Manyka *et al.* (2013), leaders, both in government and in business, need not only to know what is on the horizon, but also start preparing for its impact, in order to understand which technologies will be important to them and prepare accordingly. If business and government leaders waited for

these technologies to exert their full influence on the economy, it would be too late to reap the benefits or react to the consequences.

Some guiding principles can help companies plan for the effects of disruptive technologies. Disruptive technologies can change businesses, creating entirely new products and services, as well as shifting pools of value between manufacturers or from manufacturers to consumers. Organizations will often need to use business model innovations to acquire some of that value. Leaders must plan a series of scenarios (Sholz, 2017), abandoning assumptions about where competition and risk come from, and not be afraid to look beyond established models.

## **2.2 Organizational Resilience**

The organizational resilience, defined by Mangas *et al.* (2020) as the characteristic that allows organizations to adapt their behavior before the succession of changes, disorders and traumatic events, is emerging as a basic skill and characteristic (Comfort *et al.*, 2010) that differentiates some organizations from others (Burnard & Bhamra, 2011; Annarelli & Nonino, 2016; Moran, 2016), and this allows them to make changes in their behavior in the face of a succession of changes, disorders and traumatic events. It is not only to achieve the survival and operational capacity of the organization, but to preserve the intellectual and social capital that allows the lasting success of the organization and its adaptation to the new realities resulting from the crisis situation (Lampel *et al.*, 2014).

It is necessary to consider specific actions that reinforce the precipitating factors of the resilience within the organization. Indeed, while individual resilience can be promoted through personal actions, organizational resilience will imply that mechanisms are put in place to achieve collective effectiveness (Sutcliffe & Vogus, 2003).

Therefore, building resilience while maintaining the competitiveness and stability of business operations becomes the optimal course of action for large complex systems (Linkov, 2014; Annarelli *et al.*, 2020a). Resilience, as a property of a system, include a vast range of choices (from a password to an operational paradigm for the management system of any organization), therefore, it becomes a key challenge for companies to implement measures to build organizational resilience and at the same time maintain competitiveness and ensure business sustainability (Annarelli *et al.*, 2020a).

### *2.2.1 Adaptive resilience and antifragility*

Taleb (2012) extends the concept of resilience introducing the concepts of black swans and antifragility. In order to face a random unexpected negative event (black swan), sometimes being resilient is not enough, as everything that has a minimum vulnerability breaks, given the cruelty of time. It is needed to be antifragile, a neologism that, being the opposite of fragility, express the ability to improve in face of stresses, volatility and disorder.

Of course, there is always a limit threshold beyond which being antifragile is no longer possible, the crucial question lies precisely in trying to raise this threshold as much as possible. The critical infrastructure of our society certainly has a very low threshold (including but not limited to cyber, energy, water, transport, and communication sectors) and therefore lacks an adequate degree of resilience, generally losing essential functionality following adverse events (Linkov, 2014).

Su (2016) distinguished two different conceptions of the term resilience: balance resilience and adaptive resilience. While balance resilience deals with the idea of "bouncing", adaptive resilience, associable with the concept of antifragility, embraces the idea of "moving forward" in such a way that the disturbed system evolves into a more robust one after the recovery. According to Fisher *et al.* (2015), there are more than 70 definitions of resilience in the scientific literature that vary between two extremes of equilibrium (or recovery) resilience and adaptive resilience.

Unfortunately, all these different definitions of resilience make its meaning ambiguous (Nyström *et al.*, 2008) and, although there has been considerable research in recent times to fill these gaps, many of these questions remain open to discussion and further research (Oladokun, Proverbs, & Lamond, 2017).

In this analysis, for simplicity, we will identify the term "resilience" also as an adaptive approach, thus incorporating the concept of "antifragility" within it. So, if a resilient system is subjected to stress, at worst it returns exactly to its original state thanks to its ability to absorb and restore, at best it exploits the shock to improve its original condition through a process of positive transformation.

### *2.2.2 Resilience transformation framework*

The concept of resilience includes the intrinsic characteristics that the organization must possess in a preventive manner to an adverse event (pre-event) and the characteristics for which the importance is understood only once

the adverse event has occurred i.e. the ability to adapt (post-event). Hence resilience is represented in our framework by these two indicators: pre event ability and post event ability. National Academy of Sciences (2012) defines four phases that organizations must follow to be resilient, later recalled by numerous scientific contributions (Linvov *et al.*, 2013; Linvov *et al.*, 2014; Annarelli *et al.*, 2020b).

The phases to be resilient are: (1) Plan/prepare i.e. lay the foundation to keep services available and resources functioning during a disruptive event (malfunction or attack); (2) Absorb i.e. maintain the function of the most critical resources and the availability of the service by rejecting or isolating the interruption; (3) Recover i.e. reintroduce all resource functions and service availability to pre-event functionality; (4) Adapt (or transform) i.e. using knowledge of the event, change the protocol, system configuration, staff training or other aspects to become more resilient.

The only pre-event phase is the first (plan and prepare), which has been further divided into 5 dimensions derived from the seven general principles for the design of more resilient systems by Biggs *et al.* (2015). The 5 pre-event dimensions identified are: maintaining redundancy, connectivity management, feedback management, unpredictability acceptance, participation of actors.

The post event dimensions are absorb, recover and adapt.

It is important to emphasize that the five dimensions of the pre-event indicator are static in nature, so they can be seen as actions that can be undertaken in every moment, while the last three phases are dynamic in nature, so they are chronologically consecutive. In the present study, a system cannot be defined as resilient if it totally lacks one of these eight dimensions and the absence of one cannot be compensated for by increasing the quality or quantity of the others.

In Figure 1 we proposed our resilience conceptual framework containing these eight dimensions and the interdependences between them:

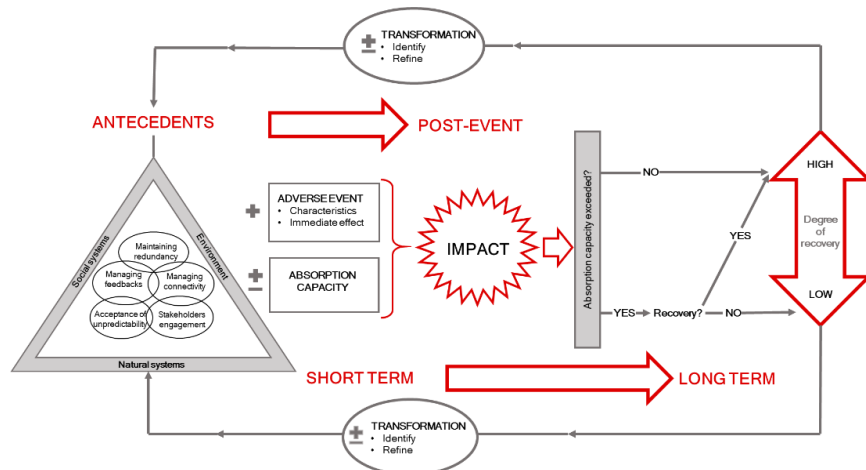

Figure 1 – Resilience transformation framework  
(inspired by Cutter et al., 2008)

The framework's structure was derived from the disaster resilience of place (DROP) model of (Cutter, *et al.*, 2008), originally designed to address natural hazards, but the authors themselves state that it could be adapted to other fast-onset events such as the dangers of digitalisation, terrorism or slow-onset natural hazards such as drought. Antecedent conditions can be viewed as a snapshot in time or as a static condition, while the post-event processes built into the model allow for the conceptualization of dynamic resilience.

Observing Figure 1, it can be seen that in the preceding conditions (represented inside the triangle), there are not only the five intrinsic dimensions of the framework (what we have), which are presented with a slight overlap so that they are not totally mutually exclusive or totally mutually inclusive, but also the exogenous variables (social systems, built environment, natural systems), which correspond to the surrounding environment understood as a constraint (where we are).

The antecedent conditions interact with the characteristics of the adverse event to produce immediate effects. Characteristics of the event include frequency, duration, intensity, amplitude, and speed of onset, which vary with the type of event. The immediate effects are mitigated or amplified by the presence or absence of the organization's absorption capacity, which depends on how the five intrinsic dimensions are put into practice at the same time as the event. This is represented in the model with a plus (amplified, if there is poor absorption capacity) or a minus (attenuated, if there is good absorption capacity). The total

impact of the event (impact) is a cumulative effect of the antecedent conditions, the characteristics of the event and the absorption responses.

The absorption capacity or threshold can be exceeded in two ways. First, if the adverse event is so great that it overwhelms the organization's capacity and is therefore impossible to stop; secondly, if the event is less catastrophic, but the existing absorption responses are insufficient to manage the impact, the absorption capacity will then be overcome by pushing the organization closer to disaster. In both cases, the organization can carry out any restoration (what we do), through the detection of the impact and the definitive restoration. The impact detection uses alarm mechanisms (automatic or not) to understand when the absorption was not sufficient. Final restoration is the phase in which we try to re-establish the optimal operating conditions possessed in the pre-event phase. Furthermore, Cutter *et al.* (2008) state that the degree of recovery can be thought of as a continuum that goes from high to low. If an organization's absorption capacity is not exceeded, higher recovery rates are rapidly achieved. If the absorptency is exceeded and the recovery process does not occur, a lower degree of recovery may result. However, if the absorption capacity is exceeded and the recovery process occurs, the organization is more likely to achieve a high degree of recovery. Regardless, overall recovery is an ongoing process and can go on until the next event.

The last phase of the framework that occurs between one event and another is the transformation phase, which consists in learning from the crisis that has just occurred. This phase is reactive and proactive at the same time, as an organization should strengthen its resilient characteristics in a reactive manner to the past adverse event and proactively to any future adverse event, probably different from the previous one. This is the reason why in the diagram the transformation is represented both in the case of a high degree of recovery and in the case of a low degree of recovery, in both cases there can be an effective diagnosis that can lead to an improvement of internal processes. Only if an organization rides the danger to improve itself can be defined as antifragile.

### **2.3 Research gap and aim of the study**

Digital systems can cause unwanted side effects and destroy the foundations needed to build sustainable social rules, or they can lack robustness, for example, in storing vital data (Sholz, 2017).

Furthermore, digital technologies are responsible for rapid changes in all social and economic structures. For Sholz (2016), in-depth, discipline-based interdisciplinary research is needed with the aim of developing the basic knowledge to create and manage resilient relationships between organizations and their digital environments.

According to Helbing (2015) digitization is a tool that has two faces: it can be at the same time a Black Swan and the means to defeat it by consolidating organizational resilience. Organizations must be able to manage this trade-off, generated in a forced manner in the last decades.

In general, the era of digitization therefore represents a new challenge for organizations, multiplying the situations in which organizational skills are tested and promoting highly competitive environments. Therefore, it is necessary to develop heuristics that provide a vast amount of information on the intervention strategies that can be proposed and that can guarantee comparison with the new social, economic, political and cultural circumstances produced by digitization (Mangas *et al.*, 2020).

This study aims to definitively link the two important research fields of digitalization and resilience by answering the following research questions:

*RQ1: How can digitization consolidate organizational resilience?*

*RQ2: How can digital companies be more resilient?*

### **3 Methodology**

#### **3.1 Case study analysis**

The research work was carried out using the methodology of the illustrative (and explanatory) case study (Yin, 1984; Eisenhardt, 1989) involving a multinational company operating in the energy sector, which in the new millennium has shown a considerable effort of digital transformation.

The case study analysis was designed with an inductive construction effort, according to the indicators obtained from past literature.

The documentation includes primary data (resulting from interviews) and secondary data (press, official company documents, such as websites and archival sources).

The proposed method is the open-ended interview, considered one of the most effective as the researcher can formulate questions of a general nature, with

which some key informants are invited to present personal points of view on the subject of study or on significant events.

### **3.2 Interview protocol**

The interview protocol was structured in eight sections, one for each dimension of the framework. Therefore, each interviewee was asked questions concerning not only the strategies to confer static resilience to the company, but also the actions and protocols to follow to react to any periods of crisis, with particular reference to real events (for example the Covid-19 pandemic, but also natural disasters or hacker attacks).

To give coherence and solidity to the research, the same interview protocol was proposed to each interviewee; of course, each tended to dwell more on the key issues in his field. In addition, to give quality and breadth to the research, an important differentiation of the people to be interviewed was opted (detailed in the next paragraph), making sure that they operated in complementary areas but at the same time being involved in the digital transition process that is taking place in the last years. In this way, it was possible to analyze the effect of digitalization across the entire company complex and over time (pre and post adverse event).

### **3.3 Sample**

With about 70,000 employees worldwide and a turnover of about 75 billion, the main objective of the company in which we conducted our case study is the production, distribution and supply of energy. Furthermore, it is one of the companies that is investing most in digitization. In fact, the digital revolution is one of the cornerstones of its industrial strategy and it is considered a fundamental tool for the development of smart grids and value-added services.

In order to give solidity to the research, this study focused on a series of face-to-face interviews involving exclusively internal employees. A total of 7 people were interviewed through a semi-structured interview: 5 high-level managers and 2 junior employees. More specifically, the 5 top managers were part of the following areas: human resources manager of the digital area (HRD), Responsible for power generation of the digital area (PGD), Responsible for organizational

transformation (OT), Responsible for planning and organizing the digital area (POD), Responsible for strategy and relations with stakeholders (SRS).

Two junior employees were interviewed at the same time, respectively part of the innovative area (in particular the field of electric mobility) (JrIA) and the relationship with suppliers (JrSR). These last two have been an important source of information for analysing some dimensions, as some issues can be better addressed with those who are directly in contact with operations.

## **4. Discussion and conclusion**

### **4.1 Results**

The case study analysis reveals that digital tools have helped to consolidate resilience, the emblematic example being the ability of the organization to automate the management of interventions. The issue of technological unemployment was also discussed, concluding that in this case too, digitization should not be seen as a tool that replaces human skills, but simply modifies them and ensures that human resources perform activities of greater added value.

In fact, this question has been partially answered with the review of the past literature, identifying, and selecting all the most important characteristics applicable to a resilient organization. But to give even more solidity to the research, we tried to understand with the analysis of the case study what dimensions were most used in practice to develop a resilient structure. Being part of the utilities sector, the respondents gave particular emphasis to the issue of infrastructure redundancy, connectivity and long-term perspective. In fact, it emerged that there are three closely related characteristics. The organization has responded optimally to the pandemic precisely because it has a well-redundant level of connectivity and has always been able to prepare well in advance for any type of situation, trying to outline more than one future scenario and not betting on a scenario in particular as many organizations still do today. In fact many organizations, in order to maintain good relations with shareholders, limit themselves just considering the level of revenue in the short term, without considering the increasingly changing environment in which they are immersed, which necessarily requires a great reactive capacity.

Obviously, digitization must be managed appropriately because it could entail a series of disadvantages highlighted in the literature and confirmed by the case study:

- Excessive fragmentation of work that risks to fail the global identification of the problems;
- Difficulty in establishing the conditions of empathy with the user to allow to deepen the latent problems;
- Loss of non-verbal communication that hinders the global understanding of the problems;
- Need for specialized training of professionals in the handling and use of these types of tools;
- Greater exposure to hacker attacks from outside, causing a consequent increase in corporate vulnerability.

Therefore, digitization helps but must be managed in the right way, because it is a tool and not an end. If an organization is hyper-digitized, this hyper-digitization inevitably brings with it an increase in vulnerabilities. The skill lies in identifying them and mitigating them. The proposed model can be a useful tool to support resilience planning and the actions to be taken to exploit digitalization in the best possible way.

In fact, as stated by OT, the crucial question is: "eliminate digitization or find a way to use it in the right way?", "If you want to have a resilient structure with a long-term vision, you must necessarily exploit digital, because if it is used in the right way it can only bring benefits " Therefore, this study acts as a link between digitization and organizational resilience, which are two macro-streams of literature widely treated but which had never yet been correlated with an accurate analysis of a case study.

#### ***4.2 Limitation and future research directions***

The study obviously leaves some gaps that suggest future research directions. First, it only focuses on three dimensions for post-event adaptive capacity; in particular, the absorption dimension has within it a series of nuances that could be analyzed in more detail. Secondly, only one case study was used to support the proposed model; future research work should adopt a wider variety of cases, in order to test and confirm the validity of the tool in different contexts and

sectors, to see if its applicability is still effective or if there are some contextual factors that could impose changes and loss of meaning to some aspects.

So far, the organizational dimensions where the impact of digital transformation seem to be more evident (information, innovation, leadership and elimination of traditional dividing barriers) are not perceived as a key element for the survival and adaptation of organizations. The perceived low importance of these factors indicates that the concept of resilience still needs to be deepened and rooted in business realities. This study is the basis for developing heuristics in the future that provide a vast amount of information on the intervention strategies that can be proposed, and that can guarantee comparison with the new social, economic, political and cultural circumstances produced by digitization. In other words, the organizational transformation must be at the same time digital and antifragile.

### Abstract

This paper provides a structured literature review (SLR) on knowledge management (KM), digital transformation, and Industry 4.0. The study aims to define all the interactions, ties, and interdependencies between the three research streams. As an essential role in a progressive discipline, our research summarises the state of the art of past and current literature using the Massaro's et al. (2016) methodological paper. The researchers adopted the Scopus database and their analysis as tools for the Bibliometrix R package to collect bibliometric data. The analysis reveals 561 peer-reviewed of English articles. The study shows some research clusters that coincide with the following survey areas: KM and ICT, KM and frontier technologies, KM and decision-making, KM and Industry 4.0, and KM and innovation. Finally, this article's originality emphasises the crucial role of digital transformation for KM development in Industry 4.0, addressing future research perspectives.

**Keywords** – Knowledge management; digital transformation; Industry 4.0; Bibliometric analysis

**Paper Type:** Academic Research Paper

## 1 Introduction

The scholarly debate under knowledge management, digital transformation and more general innovation increases in the last years (Cabeza-Pullés et al., 2020; Di Vaio et al., 2021). Despite some companies still attempting to resist change, technologies and digital transformation models increasingly gain space in this scenario by creating ideas and prototypes (Bao, 2009). Technological tools have impacted companies' transformation regarding innovation and business management (Andersson & Karlsson, 2007). In the last period, companies are mainly experimenting with how Industry 4.0 with new data management and manufacturing processes tools can enhance Industry 4.0 (Bordeleau et al., 2020). Despite the interest among the two research streams, the literature does not provide quantitative and qualitative variables on these two topics due to its recent concept (Tortorella et al., 2020).

Additionally, as Paul and Criado (2020) suggested and Massaro et al. (2016), a review article can help enhance the knowledge and address future research challenges in recent research streams. This study analyses the relationship between knowledge management and digital transformation for Industry 4.0 implementation for all these premises. Therefore, the research team will provide an in-depth analysis of the literature using the approach proposed by Massaro, Dumay, and Guthrie. In this vein, the Structured Literature Review (SLR) is an approach that combines several research methods and approaches with a thorough research protocol and allows the replicability of results (Massaro et al., 2016). The process joins the content and bibliometric analysis rules, enabling to reduce errors in the paper's collection and interpretation. Therefore, as suggested by Secinaro and Calandra (2020) and Zaheer et al. (2019), SLR allows creating interdisciplinary, rigorous and emerging research stream-oriented reviews. Furthermore, the bibliometric review is implemented using "*Bibliometrix*" package with R software (Aria & Cuccurullo, 2017). The analysis also considers the co-occurrence network, allowing creation nodes and the emergence of significant research streams (van Eck & Waltman, 2014).

After adopting a structured keyword research methodology, which will be comprehensively analysed in the method section, the article explores 561 scientific papers.

Our paper has interesting implications. We provide an in-depth discussion of the results, giving future research tools to inform researchers, offering more

insights for future studies on Industry 4.0 and KM for companies. From a practical perspective, entrepreneurs can consult this paper to recognise the links among KM, technology, and Industry 4.0. Managers could benefit from this analysis by seeing all the relevant topics and discussion among the three themes under investigation.

## **2 Background**

The development of KM can be divided into four phases. In the first one, extending from the early 1960s to the early 1990s, researchers concerned with codifying knowledge, storing explicit knowledge, and emphasising learning through best practices and lessons learned (Gaviria-Marin et al., 2018; Roper & Love, 2018).

The second stage runs from the 1990s to the early 2000s; knowledge is conceived as a fundamental economic resource of the knowledge society (Drucker, 1993). This means that organisations aiming to cope with the dynamics of change need to create information and knowledge, not just process it efficiently. At this stadium, researchers have focused more on the study and description of the processes of knowledge sharing and conversion of tacit knowledge into explicit knowledge to increase intellectual capital (Serenko, 2013).

Subsequently, from the 2000s to early 2018, research focuses on social networks, autonomous media, and human-machine interaction and understands that KM is strategic for organisations (Gaviria-Marin et al., 2018; Tzortzaki & Mihiotis, 2014).

Nowadays, several bibliometric analyses have been done on KM. Sanguankaew and Vathanophas Ractham (2019) uses different keywords than the present one to describe KM and correlates it with sustainability. Two other bibliometric analyses focus on specific analysis of a few journals whose central theme is KM, namely Journal of Information & Knowledge Management (Alajmi & Alhaji, 2018) and Journal of Knowledge Management (Gaviria-Marin et al., 2018).

According to Stolterman & Fors (2004), digital transformation can be understood as changes that digital technology causes or influences in all aspects of human life. Westerman *et al.* (2011) defined digital transformation as technology to radically improve companies' performance or reach and create new business opportunities using data and digital technologies. However, digital transformation is a disruptive change process and begins with adopting digital

technologies, progressing to an implicit or deliberate holistic conversion of an organisation to pursue value creation (Henriette et al., 2015).

The different definitions of digital transformation can be divided into three categories. Firstly, the technological aspect involves digital transformation is based on the use of new digital technologies, such as social media, mobile devices, analytics or embedded devices (Horlach et al., 2017). Subsequently, digital transformation's organisational perspective requires a change in organisational processes or new business models (Westerman, 2016). Finally, the social transformation aspect is defined as a phenomenon affecting all aspects of human life, such as improving the customer experience (Karagiannaki et al., 2017).

According to Wang (2018), digital transformation can drive towards a knowledge-based economy. This sets the basis for the fourth industrial revolution, also referred to as Industry 4.0, which relates to technological evolution and futuristic paradigms using smart and smart systems, automation, and digitised manufacturing (Ouamer-Ali et al., 2017). Industry 4.0 is used to move beyond a production model where machines are merely operationalising digital production routines, where devices can interact and work individually (Massaro et al., 2020). The main aim of Industry 4.0 is to ensure better production efficiency, productivity, and flexibility through the intelligent use of emerging technologies (Manesh et al., 2020).

However, the effects of these changes and their relation to KM have been erroneous, and the parameters involved are usually ambiguous (Meski et al., 2019). As a result of this operation, unstructured data and knowledge warehousing information system has increased considerably (Bishop, 2018). Therefore, organisations should also enhance their KM methods to truly benefit from this digital transition to search and identify useful information and create more sophisticated uses of this knowledge.

### **3 Methodology**

This paper is based on the structured literature review (SLR) of Massaro *et al.* (2016). According to D'Adamo and Rosa (2019), Dal Mas *et al.* (2019), Secinaro *et al.* (2020) Secundo *et al.* (2020) and Zaheer *et al.* (2019), this method allows a rigorous and consistent analysis of sources under study. Additionally, SLR will enable researchers to explore main research trends contributing to highlight young stream as the case of Industry 4.0 applied to the KM field (Tortorella et al.,

2020). Starting from Tranfield et al. (2003), who stated that a review should require structured and replicable processes. Despite the proliferation of literature reviews methods, the authors suggest that the SLR is the best option to join multiple ways and creates a research protocol. This method collects several multidisciplinary publications in high-ranked and multidisciplinary journals (Dumay et al., 2015; Massaro et al., 2015; Secundo et al., 2020). As reported by Secundo et al. (2020), the analysis is based on five crucial steps:

1. Write a literature review protocol.
2. Define the questions that the literature review is setting out to answer.
3. Determine the type of studies and carry out a comprehensive literature search.
4. Measure article impact.
5. Define an analytical framework.

The first elements to address consider developing a rigid research protocol based on the following items shown in Table 1.

Table 1: SLR review protocol

<b>Review protocol elements</b>	<b>Authors' consideration</b>
What is already known?	Based on the need, there is the potential for a structured literature review investigating how knowledge management and digital transformation contribute to Industry 4.0 implementation.
Research topic	The paper deals with two essential streams of literature. On one side, several authors highly investigated the KM literature by considering systematic reviews or bibliometric analysis, the digital transformation field, and the recent Industry 4.0 field.
Motivation	Disruptive technologies also face conventional KM methods even more considering the new Industry 4.0 paradigm.
Journals' research	We have decided not to limit the research to an individual scientific journal because of the still young scope. Therefore, our analysis is broad in terms of themes under investigation.

Source: Authors' elaboration

According to Zupic and Čater (2015), bibliometric research in the business and management field introduces *"measured objectivity into evaluating scientific literature"*, increasing rigour of study and decreasing review's biases. For the analysis of the quantitative data, we used R and the Bibliometrix package (Aria & Cuccurullo, 2017). Also, we used VosViewer software to conduct the keywords'

analysis. This program is also used for the keywords' cluster analysis (van Eck & Waltman, 2014).

The second step in an SLR is research questions' selection. Considering the introductory gap, research questions address are:

*RQ1. What are the characteristics of the literature for KM and digital transformation in Industry 4.0?*

*RQ2. What is the focus of this literature in terms of key concepts?*

*RQ3. What are the future directions of research in this field?*

In the third position, the authors used the Scopus database to extract all the relevant sources. The database incorporates relevant and updated references, and has the same scientific validity as Web of Science (Okoli & Schabram, 2010). To select the appropriate scientific flow, we consider a keywords analysis, including a structured research strategy. Based on the paper of Rosa *et al.* (2020), the research team uses the following research strings:

"Knowledge management" AND "Industry 4.0" OR "Additive manufacturing" OR "Cloud manufacturing" OR "Internet of Things" OR "IOT" OR "cyber-physical system" OR "Augmented reality" OR "3d" OR "Industrial revolution" OR "fourth industrial revolution" OR "Simulation" OR "Smart production" OR "Smart manufacturing" OR "Data mining" OR "Digital" OR "Smart".

Additionally, to increase the focus of our analysis, we include relevant search limitations selecting only peer-review articles on the business, management, and accounting area written in the English language. The analysis was conducted in December 2020 and, to ensure the inclusion of relevant articles, four authors independently verified that the extracted items were related to the study's scope (Grafton *et al.*, 2011). The first analysis reveals 12,108 documents, after the application of research limitations, we consider only 3,306 peer-review articles, then only the area of business, management and accounting is considered. Therefore, the final sample consists of 561 English scientific articles.

The fourth point, considering the selection of article with an impact in the field of analysis, the paper will begin to consider the most cited papers in the area. The data selection biases can be avoided with bibliometric analysis due to the quantitative analysis that could help researchers focus on the primary and relevant papers (Zupic & Čater, 2015).

Fifthly, we improve a coding framework based on the previous literature (Dal Mas *et al.*, 2019; Massaro *et al.*, 2015). Table 2 shows the analytical framework created for the analysis.

## 4 Results and discussion

The purpose of this section is to present the results of the study of the paper pools under investigation according to point nine of Massaro, Dumay, *et al.* (2016) methodological paper.

### 4.1 Characteristics of literature on KM and digital transformation in Industry 4.0.

To answer the first research question regarding the literature's characteristics on this topic are presented in the first paragraph. Table 3 ranks preliminary information regarding the data under analysis. As shown, the first year of scientific production in this field is 1988. In this regard, it is possible to point out three periods of research from 1988 to 1998 with low scientific production in this field. Second, from 2000 to 2010 with increased interest of researchers in this field. Third, from 2011 to 2020 with a significant increase in scientific production three times compared to the previous decade. Articles are published in 200 scientific sources, and the average publication rate is 6.68 articles per year. The authors then used 27,473 references from other authors and 1.875 keywords showing the relevant debate under this theme absent in others research field (Bhatt et al., 2020) Besides, the number of articles by multiple authors confirms that the scope of research is extremely collaborative. Only 93 have single author signatures. The collaboration index also demonstrates it for 2,82.

Table 3. Main information about data

Description	Results
Timespan	1988-2020

Table 4 shows the ten most cited articles of the cluster, which represented a milestone in the field. Kanawattanachai and Yoo (2007) develop a model for the KM of virtual team considering expertise location, task-knowledge coordination, and cognition-based trust and the impact on the team's performance. On the same side, Kane and Alavi (2007) studied the effect of information technology (IT) in organisational learning (OL), exploring the different learning processes. More business focus is the contribution of Hsieh *et al.* (2006) and Shaw *et al.* (2001), which tested KM considering data mining for psychological purchase detection by customers. These two papers introduced a new research field extended by the years from several authors.

Table 4. Most Global Cited Documents

<b>Paper</b>	<b>Total citations</b>	<b>Total citations per year</b>
(Kanawattanachai and Yoo, 2007)	382	27.2857
(Hsieh <i>et al.</i> , 2006)	376	28.9231
(Shaw <i>et al.</i> , 2001)	361	18.0500
(Barrett <i>et al.</i> , 2015)	341	56.8333

Source's analysis in Table 5 shows the highest number of published articles 34 from the Journal of Knowledge Management as a primary Journal in this field. Subsequently, other journals interested in the area are the Decision Support Systems Journal with 30 publications and the Knowledge-Based Systems and the Technological Forecasting and Social Change journal with 18 publications.

## **4.2 Keyword's analysis**

To analyse the information structure in this area and answer the second research question, the researchers analysed the keywords of the published papers using the Vos Viewer software (van Eck & Waltman, 2014). Our results determine five research nodes considering KM and ICT, KM and frontier technologies, KM and decision-making, KM, Industry 4.0 and finally, KM and innovation.

### **4.2.1 KM and ICT**

As we can see, the blue area of Figure 2 focuses on KM and ICT. According to Turulja and Bajgoric (2018), information technology (IT) changes business and manages human resources. For the authors, IT can enhance human resource management by improving KM in this vein. This relationship creates benefits also for business performance. More specific are the results of Park *et al.* (2015), which develop a KM framework considering the firm's size. Their results suggest that a fast IT learning process is aimed at when internal learning processes are slow. Therefore, learning mechanisms can benefit from external sources as internal electronic communication networks, external communication networks, company knowledge repositories/portals, and inter-organisational knowledge repositories.

### **4.2.2 Knowledge management and frontier technologies**

Interesting are the results of the second research strand coming from the yellow area of Figure 2. Our results suggest that new frontier technologies are emerging. For instance, Nemati *et al.* (2002) 's contribution gives a broad idea about decision support systems and new tools such as data warehousing

supported by artificial intelligence. Therefore, through innovative architectures for companies, it is possible to validate, store, organise and disseminate data and knowledge for workers. Lei and Wang (2020) propose an efficient methodology for transferring and managing corporate knowledge based on artificial intelligence in this line of study.

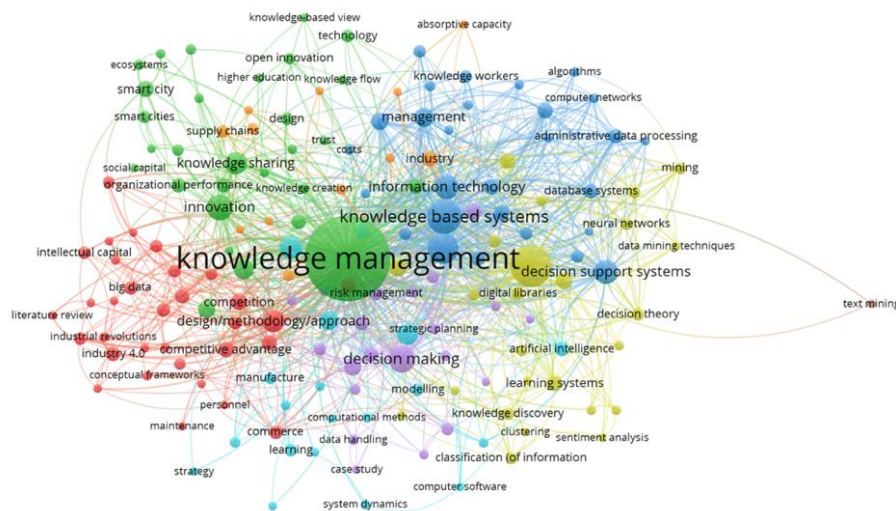

Figure 2. Co-occurrence keywords  
Source: Authors' elaboration using VosViewer software

### 4.2.3 Knowledge management and decision-making

The third strand of research (purple area, Figure 2) demonstrates a strong link between KM and decision-making. Among the earliest contributions, Balasubramanian *et al.* (1999) research models and implements a framework to describe the KM processes that lead to relevant business decisions. A few years later, Howells *et al.* (2004) discuss the externalisation of corporate decision-making knowledge. Based on case studies, the article develops a possible external knowledge model to support internal decisions. Looking more internally, Ghrab *et al.* (2017) show that corporate data improves ability, decision making and knowledge sharing between companies in the same group or geographically distant

#### 4.2.4 Knowledge management and Industry 4.0

The fourth research strand (red area, Figure 2) addresses the link between KM and the Industry 4.0 paradigm. This topic has seen increasing interest from researchers (Massaro et al., 2020), this trend is also confirmed in this research area. Recently, Meski *et al.* (2019) define Industry 4.0 as a paradigm within ICT and propose a conceptual framework based on business data exploitation. Schott *et al.* (2020) describe the boundaries of knowledge by specifying that KM and Industry 4.0 primarily refer to technologies for manufacturing production processes. Thus, the Industry 4.0 context can increase the complexity of data managed at the production level and provide practical knowledge inputs.

Finally, the research links become even more structured with Tortorella *et al.* (2020), who show how learning capacity at the firm level is a positive mediating factor towards Industry 4.0. Therefore, the authors conclude that learning and knowledge sharing can further increase with the new Industry 4.0 paradigm.

#### 4.2.5 Knowledge management and innovation

Finally, the fifth strand of research (Green Area, Figure 2) analyses KM and innovation. For example, Garcia-Morales *et al.* (2018) 's investigation contributes to the literature by creating a structured model of how social media can drive technological competencies to enhance and leverage corporate innovation capacity. Along the same lines is Manville *et al.* (2019), who investigated KM processes using balanced scorecard theory as a monitoring tool. More specific is the research by Santoro *et al.* (2018) in the context of the Internet of Things (IoT). Here, the authors invent a model of developing firms' internal capabilities for KM as a disruptive point for firms' ability to innovate. Alongside this, several studies focus on knowledge collaboration between firms creating a specific research strand of KM and open innovation (OI) (Randhawa et al., 2017; Simeone et al., 2017).

## 5 Conclusion

This section aims to conclude the present paper by providing insights, critiques, and implications for the research stream investigated.

The literature analysis identified a gap related to the lack of quantitative and qualitative variables on the reference topics (Tortorella et al., 2020). As suggested by Paul and Criado (2020) and Massaro et al. (2016), a review article can improve

knowledge and address future research challenges. Therefore, our SLR aims to analyse the relationship between KM, digital transformation, and Industry 4.0.

The implementation of the SRL method (e.g. Dal Mas et al., 2019) collects several multidisciplinary publications in high-level, multidisciplinary journals (e.g. Massaro et al., 2015). The study used bibliometric analysis, which Zupic and Čater (2015) used to increase the study's rigour and decrease review bias.

The 561 papers' analysis indicated the highest number of articles was published by the Journal of Knowledge Management, 34. Additionally, notable are the 30 publications in the Decision Support Systems Journal and the 18 in Knowledge-Based Systems and Technological Forecasting and Social Change Journal. Among the relevant authors are Kanawattanachai and Yoo, Kane and Alavi, Hsieh, and Shaw. Specifically, these last ones tested KM by considering data mining to detect customer purchases' psychological detection. The topic does not yet appear to be fully involved in the KM stream. Indeed, our keyword analysis distinct five research streams related to the topic: KM and ICT, KM and frontier technologies, KM and decision-making, KM and Industry 4.0, and KM and innovation.

Based on this, several theoretical implications were found. This paper contributes to linking KM, digital transformation, and Industry 4.0. This allowed finding that the paradigm of Industry 4.0 can increase companies' data, even if it is in an early phase of development. Specifically, companies bring increased business knowledge and management of it through technological innovation. Although the flow of research between KM and Digital Transformation is widely developed, critical analysis reveals that the more subtle the links with Industry 4.0, the better.

As well, numerous practical implications were found. The study allows managers and Chief Technology Officer (CTOs) to view current connections in the literature and understand the new technological frontiers. It has also uncovered areas of inquiry not yet explored in practice, such as data mining.

Like any research, the present one has limitations. Primarily, it records the use of only the Scopus database to perform a bibliometric analysis of the literature. Next, the use of keywords limits the full understanding of the topic and its knowledge.

Therefore, to answer our third future research, scholars may deploy an essential number of case studies, in which researchers are hired within companies to examine KM in highly digital environments. Furthermore, it will be informative to implement comparative analyses across geographic areas and countries to verify

any distinct variables on the topic. Also, consider researching to check the level of connection between the expectations of professionals and researchers. Furthermore, starting from the study of Cabeza-Pullés *et al.* (2020). We believe that research insights could resolve the debate on KM processes in private organisations by showing collaborations in the context of Industry 4.0. Furthermore, considering the results of Wu *et al.* (2013), more studies could be conducted to investigate how KM related to Industry 4.0 translates in different sectors by showing valorisation and digital innovation mechanisms activated in them. Finally, future researchers could investigate whether KM in highly digitised companies with Industry 4.0 applications can increase companies' marginality and how this value is distributed to stakeholders from a quantitative research perspective.

**Funding:** This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

### **Abstract**

This article aim is to review existing research on knowledge management (KM) in the context of contemporary digital transformation and its implications for business model innovation (BMI) in a hyperconnected environment. Using a systematic approach to literature review, this study contains papers that were collected from WoS and Scopus databases. 22 peer-reviewed articles formed the basis of analysis. The findings of this study suggest that KM is a key function in redesigning a firm's business model and together with the use of the new digital technologies can promote the effective adaptation to an ever-changing environment. Thus, organization ought to make the necessary modifications in their KM processes to make the new ever more often digital knowledge accessible, as well as to shape existing knowledge in order to redesign their business models towards continued BMI.

**Keywords** – Knowledge Management, Hyper-connectivity, Business Model Innovation, Digital transformation.

**Paper type** – Academic Research Paper

## 1 Introduction

In the knowledge management literature, knowledge has long been defined as a set of information; the context of which is provided by individuals and groups and their management in an organization (Dahlberg in 1995; Drucker, 1999; Firestone, 1999; Houlthouse, 1999). Numerous studies underline that KM is both a key resource for the company (Friedrich, Becker, Kramer, Schneider, 2020; Uden & He, 2017) and a process aimed at supporting the continued and sustainable development of organizations and their members (Durst and Zieba, 2020). However, knowledge management is acquiring a new dimension, a new role in a dynamic development economy (Rot & Sobinska, 2020) according to the new era. What is new is that modern technologies generate ever more reports loaded with data and information that need to be put in contexts and filtered to detect relevant information. In this kind of a hyperconnected world, knowledge management (KM) is becoming important in new ways (Valentim, 2002).

The latest fast-paced and worldwide developments regarding the ongoing pandemic COVID-19 underline the need for a paradigm shift to integrate digital technologies into KM (Ikpe, Didier and Dong-Heon, 2020) to improve the sustainability. Scholars advise to go for digital transformation, big data, virtual intelligence, and robotics in their KM (Barbosa, 2020). A research gap that has been identified within this context is what will be the role of the new digital-transformed KM and business model innovation (BMI) (Valentim, 2020). More specifically, there is a paucity of “full scope” (Manesh et al., 2021) or comprehensive studies addressing companies’ digital transformation in KM and progressive pursuit of BMI (Manesh et al., 2021). It thus is expected that KM can take its rightful place as a dynamic resource that can also have a decreasing meantime, so the implications of the on both KM and Knowledge Management Systems (KMS) need to be rigorously studied (Durst and Zieba, 2020). Against this background, the aim of this paper to systematically review current research on

KM in the context of contemporary digital transformation and its possible implications for BMI in an increasingly hyperconnected environment.

This paper considers knowledge as a critical and dynamic resource that evolves as the environment itself evolves (Durst and Zieba, 2020; Friedrich et al., 2020); that is, this paper reviews systematically new roles of KM given new technologies and digital transformation that enrich possibilities for BMI for the purposes of integrating them in a unified framework. The paper also emphasizes the need for sustainable business operations also after the COVID-19 pandemic (Peeri et al., 2020; Guerreri et al., 2020; Bhattacharyya et al., 2021) or contexts in which companies take up in their KM new technologies, making decisions against the clock, adapting their operations for circular business models, and downsizing their supply chains (Akpan et al., 2020; Derevyankina et al., 2020). It is also assumed that business model innovation (BMI) is crucial for reaching a sustainable competitive advantage (Evans et al., 2017; Haaker et al., 2021). Business model innovation has been summarized as a process of creating and developing new architectures to improve the sustainability of companies (Amit and Zott, 2012).

The paper is structured as follows. The next section briefly sets the frame of the paper. This is followed by the presentation of methodology used for doing the systematic literature review (SLR). Then, the proposed framework is presented showing the link between KM and digital transformation and BMI and which was derived from the analysis of the papers. The paper terminates with a conclusion.

## **2 Literature background**

“Uncertainty is the only certainty, change is the only constant” (Nonaka, 1991). Knowledge society and the new digital economy have emerged because of constant change (Turulja et al., 2018). Companies need to develop new understandings in business model redesign and innovation to maintain sustainability of their business operations (North and Kumta, 2014; Paoloni et al., 2020), and innovation in KM (Hsu and Sabherwal, 2011). Although it is not enough to acquire knowledge and new understandings as well as the capacity to apply them properly is needed to achieve a market advantage through knowledge management (Carneiro 2000; Kalotra 2014; Darroch 2005).

Value for the firm from such a KM system enables BMI and the company to survive and have sustainable competitive advantage in the contemporary context

of hyperconnectivity (Ferraris et al., 2017; Santoro et al., 2018; Bogner & Bansal, 2007; Lee & Choi, 2003; Tanriverdi, 2005).

Nonetheless, KM, digital transformation, and BMI have been studied mostly separately in the literature, the concepts combination is viewed as a promising topic (Rot et al., 2020). A company that is successful in taking advantage of all these three aspects is able to create new knowledge, engage in BMI, and in turn create new value (Nonaka, 1991; Quintas, Lefrere, et al., 1997; Vaiappuri et al., 2016). Within this context, this research analyzes recent research on KM and how it in the hyperconnected world coevolves with digital transformation and BMI. By taking a SLR approach, this understanding shall be determined. Based on that the following primary research question is posed primary RQ1: what is the role of KM in the current era of digital transformation and hyper-connected markets based on business transformation? i.e., what role of the new digital-transformed KM plays in business model innovation (BMI)?

In this light, the article proposes a theoretical framework of KM which is the output of a reviewing of 22 articles identified.

### **3 Methodology**

In our review process, the research briefly adopted the principles of a SLR as recommended by Jesson, Matheson, and Lacey (2011), namely: (1) mapping the field through a scoping review, (2) comprehensive search, (3) quality assessment, (4) data extraction, (5) synthesis, and (6) write-up.

First, we developed a research plan to answer the primary RQ1: what is the role of KM in the current era of digital transformation and hyper-connected markets based on business transformation? i.e., what role of the new digital-transformed KM plays in business model innovation (BMI)? Also, we have investigated each article to answer the remaining research questions (see Table 2).

e II). We comprised keywords, and a set of inclusion and exclusion criteria.

We from the start at conceptual research, focusing mainly on recent systematic literature reviews, to determine the current role of the KM within BMI considering the influence of the digital transformation. Articles that included the keyword combinations "KM"; "KM and SRL"; "Digital transformation"; "Digital transformation and KM" "strengths"; "KM and Digital transformation" "Business model innovation"; "Business Model Innovation and KM"; "KM and Business model innovation" were included.

In addition, we specified inclusion and exclusion criteria. Inclusion criteria were publications in the period 2005-2021, academic articles giving priority to those systematic reviews already carried out on the role of KM, English language, and WoS and Scopus databases. The SLR approach allowed us to follow advances and trends within the chosen discipline field and to include them in the conceptual paper and literature (Merigó et al., 2016). Sometimes these studies guide scholars in researching more influential disciplines (Godin et al., 2006) with WoS being an essential platform for this type of research (Carvalho et al., 2013).

The systematic literature review on KM built on some relevant SLR already conducted such as those by Durst et al. (2019, 2020); Martins et al. (2019); Paoloni et al. (2020); Bamel et al. (2021); Di Vaio et al. (2021). This provided us a conceptual framework in the state of art allowing to build and question the theoretical body of concepts (Meredith, 1993) – in this case, a dynamic model of KM (Durst and Zieba, 2020; Bamel et al., 2021). This type of reviews follows a series of procedures (see Table 1) oriented to answer a previously relevant research question (Green, Johnson, & Adams, 2006; Kitchenham & Charters, 2007; Klein et al., 2021).

Papers published prior to 2005 included reports and non-academic research, also in other languages than English, as well as research published on journals in areas other than business and KM represented exclusion criteria. We produced an excel sheet consisting of the key aspects related to the research aim which were name of author(s), publication year, research aim/objectives, method, and main findings.

The third step was a review of the abstracts to make sure that it was within the pre-defined scope. This procedure yielded a final selection of 22 articles, giving priority all the SLR relevant conducted regarding the selected keywords to help with this approach to any inconsistency in the analysis and the conclusion drawn from there. Fourth, the preliminary draft of the article was jointly discussed involving all authors. Such debate enabled the authors to rethink the findings under themes which, in turn, helped to clarify what is the role of KM into BMI since the advent of the new technologies. Fifth, a Synthesis procedure and the final stage of the review process was the write up the findings.

Table 1 outlines the parameters that forms the basis for the analysis process to help us developing a theoretical framework to connect KM and its role in BMI in the current moment of digital transformation.

Table 1 Systematic review: Reproducible research protocol parameter (adapted from Klein and Todesco, 2020)

Parameter	Value
<b>Research Question (primary)</b>	(Q1) what does the role of knowledge management join to digital transformation in a hyper-connected market based on business transformation, is a key element in BMI? i.e., what role of the new digital-transformed KM plays in business model innovation (BMI)?
<b>Objective</b>	This article aim is to review the existing field of research on knowledge management (KM) in the context of contemporary digital transformation and its implications for business model innovation (BMI) in a hyperconnected environment.
<b>Combination of keywords (in title or abstract)</b>	"KM"; "KM and SRL"; "Digital transformation"; "Digital transformation and KM" "strengths"; "KM and Digital transformation" "Business model innovation"; "Business model innovation and KM"; "KM and Business model innovation"
<b>Virtual Bases</b>	Web of Science/Scopus
<b>Type of materials</b>	Scientific papers, chapters, conference papers, open-access materials
<b>Year</b>	2005 to 2021
<b>Selection Criteria</b>	1. Preference on journals from management field of study 2. Search for keywords in title and abstract 3. The most cited materials 4. Preference SRL on those keywords selected
<b>Data extraction method</b>	Text/content analyses: Focus on objectives and main results
<b>Search refinement</b>	Keywords were searched more than once to include newest publications (since the pandemic is still going on)
<b>Total No. of articles analysed</b>	22

## 4 Findings

The findings of the SLR are presented in Table 2. They are presented according to themes which were the outcomes of the process described in the previous section.

Table 2 Themes identified

Theme	Authors and subject of interest	Research Questions
<b>Awareness arising/GAP</b>	<p>Di Vaio et al., 2021 pointed out the relevance of researching KM and KMS as critical resources that contribute and lead the company's strategy to create value through new and innovative business models in a digital innovation era.</p> <p>Di Vaio et al., 2021 underline that there is a gap is regarding KM's role as a source of sustainability for companies in the BMI process, given hyperconnectivity a digital transformation in of markets and much of the world at large.</p> <p>Durst and Zieba 2020 set that KM can take its rightful place as a dynamic resource that can also have a decreasing meantime, so the implications of the on both KM need to be rigorously studied</p> <p>Gaviria et al., 2019 discuss of the arrival of a fourth generation in which the KM should take on new roles.</p> <p>Klein and Todesco 2020 present the question of how SMEs can cope with a constantly changing society due to digital transformation through knowledge management to adapt to these new demands.</p> <p>Serenko 2021 stresses a further development in the body of knowledge management.</p> <p>Turulja and Bajgorić 2018 propose that the effect of knowledge management and product innovation in the business performance should be analysed.</p>	<p>What are the emerging approaches in knowledge management in the literature? What role the new digital-transformed KM plays in business model innovation (BMI)?</p>
<b>Framework to improve GAP</b>	<p>Birasnav 2014 notices a direct connection between knowledge management and organizational performance. Specifically, a suitable knowledge management has a positive implication on it, even helping to predict future scenarios.</p> <p>Birasnav 2014 identify that the improving business performance requires the research of the linkage between KM and organizational model innovation.</p> <p>Durst et al., 2019 draw that the role of KM is relevant in the innovation process.</p> <p>Durst and Zieba 2020 stress the importance of connecting KM to the sustainability of companies' operations, environmental changes, and knowledge risks all factors that influence organizational success and sustainability.</p> <p>Klein and Todesco 2020 describe that knowledge is relevant to understand the new consumption (Klein et al., 2021) and organizational patterns followed by firms in their business models. To adopt new understanding on the changes in the environment and how to cope with</p>	<p>What should linkages be address in the future research to cope the existent GAP?</p>

them, during and after the pandemic, is a concern that KM, along with digital transformation studies, can help illuminate better ways of doing business.

Klein and Todesco 2020 draw that the Knowledge is a source of competitive advantage, but it is more relevant to put it in context with digital transformation.

<b>Initial definitions for analysing the linkage between the KM, DT, BMI.</b>	<p>AlGhanem et al., 2020 observe that the creation, communication, and application of knowledge through knowledge management is the key driver for improving organizational performance.</p> <p>Bamel et al., 2021; Durst and Zleba 2020 define KM as it has been conceptualized as a type of dynamic capability/resources and source of competitiveness and innovations,</p> <p>Di Vaio et al., 2021 show that the business model of innovation seeks to adapt firms to the changes in a global market by making use of knowledge as the key element in that innovation process. Since the reconfiguration of knowledge and its creation make up the innovation process.</p> <p>Fowler 2000 considers that the knowledge is not limited to the dimensions of tacit and explicit.</p> <p>Haaker et al., 2021 highlight that business model innovation (BMI) aims to provide sustainable competitive advantages to firms.</p> <p>Rot and Sobinska 2020 the firms that innovate their business models improve their performance and achieve sustainability.</p> <p>Vaiappuri et al., 2016 invite to go further within the dimensions of knowledge since the article considers, supporting other author's theory as Koenig, that the classification into explicit and tacit is too simplified. Therefore, the role of KM is still to be developed.</p>	<p>What current definitions are taken as a starting point for research on KM in the context of digital transformation and its implications for BMI? - in reference to knowledge management, digital transformation, and business model innovation?</p>
<b>KM in Hyperconnected world</b>	<p>Bamel et al., 2021; Paoloni et al., 2020, both articles highlight that the survival of companies depends on adapting to new ways of configuring information and knowledge in this knowledge-based society. The authors point out that knowledge management is the process that allows the necessary configurations of knowledge to improve the competitiveness of companies in this hyperconnected world.</p> <p>Birasnav 2014 suggests that the hyperconnected world makes for turbulent international markets and demands companies to innovate in their KM to create and reconfigure existing knowledge into organisational knowledge that adds value and competitiveness to the company.</p> <p>Giovanni 2010 describes that the arrival of globalization, internationalization, partnership, supply chain management and dynamics make the role of KM critical.</p> <p>Durst and Zleba 2020 identify that knowledge is a dynamic resource that evolves over an average period, a hypothesis that seems to gain strength in the case of new technologies, it is logical to consider that knowledge management is key to the sustainability of companies in a hyperconnected world. Therefore, needs to be updated to become a positive burden for the company.</p> <p>Turulja and Bajgorić 2018 draw that knowledge society and the new</p>	<p>How does the hyperconnected world affect in both KM and its impact in the firms?</p>

digital economy have emerged because of constant change.

Vaiappuri et al., 2016 sign that the organisation and its environment co-evolve to maintain a competitive advantage in an uncertain environment. Success depends on knowledge and the ability to both shape the existing and create the new according to changes in the environment itself by making use of KM.

#### **KM and Digital Transformation**

AlGhanem et al., 2020 present that the new technologies allow knowledge management tools to enable the process of sharing, creating, and organizing knowledge despite contexts such as the current pandemic. In short, knowledge tools make the management and generation of knowledge through IT implementation simple.

Durst and Zieba 2020 propose that KM has found a broader framework full of opportunities since arrived of new information and communication technologies.

Fakhar et al., 2021 The use of technologies during the pandemic was key to enable knowledge sharing within and outside the company, technological advancements have driven together with the KM the knowledge economy.

Gaviria et al., 2019 state that digital transformation and its new technologies determine the knowledge flow of the company and together with KM have a positive influence on the company's activities. KM should be considered together with technologies as an integral process.

Herschel and Jones 2005 addressed the idea of modern KM allow to search, organize, select the relevant aspects, and extract value from multiple sources of information using new technologies.

Ikeda et al., 2021 the study considers that now we are moving towards an IoT ecosystem that allows turning knowledge into wisdom, connectivity that enables to detect changes in the environment and provide a response to these changes quickly. The digital transformation support KM in a highly dynamic environment.

How has KM been shaped by new technologies, and has it had a direct impact on its implementation?

#### **Digital-transformed KM in BMI**

Giovanni 2010 mentions that KM supports the business by contributing to their components in the innovation process.

Di Vaio et al., 2021 emphasize that business models that are characterized by an open platform for the exchange of knowledge with the environment and other companies are moving towards innovative and sustainable models through the adoption of KM and DT guiding the firms towards business model innovation improving the organizational performance.

Durst and Zieba 2020 stress that on the outside, consumers continuously change their preferences. The market is characterized by uncertainty. On the inside, a company will rethink its business model, innovate as to sources of knowledge and KM, to adapt and to main sustainability of its operations.

Jang et al., 2020 found that BMI relates to changes in one or another building block where the changes are coming from a reconfiguration of corporate choices pushed and driven by knowledge.

Klein and Todesco 2020 point out that this is a concern where KM

What is the role of KM in the current era of digital transformation and a hyperconnected world based on business transformation, a key element in BMI? i.e., what role of the new digital-transformed KM plays in business model innovation (BMI)?

together with DT studies can help shed light. New knowledge configurations together with technologies can bring new insights on how to adapt to a changing environment by redesigning business models.

Paoloni et al., 2020 conclude that the companies need to develop new understandings in business model redesign and innovation to maintain sustainability of their operations in the market.

Turulja and Bajgorić 2018 link KM and innovation since Knowledge forms part of the basis of innovation and is considered key to both business success and survival in a highly dynamic business model environment.

---

Overall, the extracts from the papers reviewed draw a promising approach as the researchers addressed the idea of KM from a new innovative perspective to be developed. Indeed, KM is stressed as main element to ensure the company's sustainability and one of the first part to considering redesigning the business model to survive in a hyperconnected world.

The papers studied can be assigned to the following broad themes: awareness arising/GAP within knowledge management discipline, framework to improve GAP, Initial definitions for analysing the linkage between the KM, DT, BMI, KM in Hyperconnected world, KM and Digital Transformation and Digital-transformed KM in BMI.

In the light of the findings of this systematic literature review we support that the driver of changes in the context of creating new and innovative business models is mainly information and communication technology and better and more effective ways of sharing and creating organizational knowledge (Parnell et al, 2018; Rot, A; Sobinska, M., 2020) through knowledge management for redesigning better business models that enable companies to be sustainable in a hyperconnected environment.

## **5 Conclusions**

There is an agreement that KM is a management process that is a source of competitive advantage (Heisig et al., 2016; Bamel, 2018), and a dynamic resource in both ways (Bamel, 2018; Obeso et al., 2020) where phenomena as globalization make the role of KM increasingly critical and dynamic (De Giovanni, 2010). Furthermore, digital transformation becomes relevant since new technologies have a key role in the acquisition, creation, generation, sharing, diffusion, and utilization of knowledge (Malik et al., 2020). During the COVID-19 pandemic, the same technologies have enabled sharing and creation of knowledge through socialization, externalization, combination, and internalization (Nonaka and

Takeuchi, 1995). However, during the recent pandemic, socialization was restricted.

Therefore, the starting point of this article is to set a broader understanding of the existing body of knowledge management with emerging issues such as digital transformation and innovation in business models. The inclusion of digital transformation for KM has led to an improvement in the way the information is processed, new knowledge is discovered, and projects are collaborated on globally, regardless of geographic location and speed of decision making within the firm (Davenport and Prusak, 1998). This, in turn, improves the sustainability of the firm through rethinking its business models (North and Kumta, 2014). As a result, knowledge management has acquired a new dimension and a new role in a dynamic development economy. This happened because limiting knowledge management to the human factor is an approach that seems too narrow and should be extended to technological and organizational aspects (Rot, A; Sobinska, M., 2020).

The growing interest in knowledge management is acquiring a new dimension as well as a new role in a dynamic economy of development. Therefore, it is important to ask what the role of knowledge management in response to digital transformation in a hyper-connected market based on business transformation. For example: what role does the new digital-transformed KM play in business model innovation (BMI).

Nonetheless, there has been a gap regarding the role of KM, as a source of sustainability for companies (Turulja et al., 2018; Di Vaio et al., 2020) since the advent of new technologies in the BMI process. The framework provides a better understanding of the importance of KM in a hyperconnected world (MacInnis, 2011) and sustainability (Durst, 2020) for BMI, and thus can guide us towards future research directions.

Based on the final number of 22 articles reviewed, it is determined that companies will not survive in the current environment if they do not engage in BMI (Turulja et al., 2018) through KM-related innovation (Darroch and McNaughton, 2005). Consequently, KM is a key element within the building blocks within BMI (Friedrich, Becker, Kramer, Wirth, and Schneider, 2020; Uden and He, 2017). Proper implementation of KM helps the companies to identify what is considered as crucial knowledge, how the sustainability can be increased, and how they can participate better in BMI (Chew and Gottschalk, 2013; Lopez et al., 2017).

Given that knowledge is the key and dynamic resource for innovation (Jackson, 2019; Castro et al., 2011; Durst and Zieba, 2020), the increase in information generated by technologies makes KM increasingly relevant. KM is the key to achieving and maintaining a competitive advantage (Gandoni and Haider, 2015). Any alteration in KM is a source of innovation for the company redesigning its business model resulting in business model innovation.

In conclusion, we consider that KM is a key building block that, together with the adoption of new technologies, allows companies to adapt to the changing environment. In addition to reconfiguring knowledge into new forms (Du Plessis, 2007), KM can create organizational knowledge, innovate value, and guide BMI. Thus, KM is directly involved in business model innovation in the pursuit of business sustainability. The improvement of strategy, dynamic capabilities, innovation, knowledge creation, and knowledge exploitation (Ferraris et al., 2017) has a positive influence on KM and digital transformation which affects BMI and sustainability.

### ***5.1 Managerial Implications***

Linking KM, new technologies, and digital transformation for BMI relate to entrepreneurship and implementation and innovation. Knowledge is relevant to understand the new ways of consumption (Klein et al., 2021) and organizational patterns followed by firms in their business models. KM research should enable entrepreneurs to develop a broader approach to address the ongoing pandemic (Ravindran and Boh, 2020). To adopt the changes during and after the pandemic as well as understanding the environment and how to cope with it, KM with the digital transformation studies can help illuminate better ways of doing business (Klein et al., 2021). In short, KM and new technologies encourage both rethinking and innovation of business models (Arkan, 2016; Erbert and Duarte, 2018; Mahraz, Benabbou, and Berrado, 2019) and thus prepares better for eventual new crises (Ravindran and Boh, 2020).

A company must make the necessary modifications in its KM system to implement as many processes as possible to create new knowledge and exploit existing knowledge in its BMI. The company will benefit from reacting proactively, recognizing changes in the environment, and ensuring sustainability in today's hyper-connected world. Our understanding is that the entrepreneurial ecosystem

of the future will set emphasis on KM as one of the building blocks of BMI and sustainability.

### ***5.2 Theoretical Implications***

The findings suggest that most authors have limited mentions of the theoretical framework used for defining the role of KM with new technologies and business models.

From a theoretical standpoint, this article engages a broader study of KM that considers emerging issues such as digital transformation and innovation in business models. This is also supported by several authors. In 2000, Carneiro stated that KM increased the performance of companies. Shujahat in 2019 determined KM as the key element in the exploitation of the innovative potential of firms.

Additionally, it also supports the open innovation theory (Alexy, Bascavusoglu-Moreau, and Salter, 2016; Di Vaio et al 2021). It considers an open culture development within a firm to enable knowledge management in conjunction with the use of technology. This, in turn, leads to business sustainability over time through innovation, where firms can and are encouraged to use external ideas with internal ideas. Therefore, the article draws knowledge sharing and knowledge management as a critical part of a dynamic environment both internally and externally for the innovation process.

In summary, this article contributes to the existing literature by approaching KM from the perspectives of digital transformation and innovation, pointing out the need to increase understanding about the role of KM and its implications for organizational sustainability in the contemporary era of digital transformation.

### ***5.3 Future Research Trends and Limitations***

As with any research, this one has its limitations as well that open the passage for future research developments. Further research is needed to refine and empirically test the framework. An example of this might be testing the SMEs during the ongoing COVID-19 pandemic. Furthermore, the terms such as KM risks and Knowledge Management Systems (KMS) might also contribute to enriching the presented framework.

## Acknowledges

The authors would like to thank the review team for their helpful suggestions and feedback on the previous paper versions.

## ANNEX

Title	Author (s)	Year	Research/aim/objectives	Method	Main findings
The role of KM in enhancing AI algorithms and systems. <i>Advances in Science, Technology and Engineering Systems</i> , 5(4), 388–396.	AlGhanem, H., Shanaa, M., Salloum, S., & Shaalan, K.	2020	shows the relation between KM processes and AI systems from a higher perspective, giving different options to apply other KM processes for the same AI algorithm to reduce any implementation challenges and enhance the adoption level.	Systematic review	The main finding of the research was the massive impact of some KM processes like knowledge acquisition and knowledge creation on the different types of AI systems and algorithms to give an additional option for organizations during the implementation
Knowledge management within a strategic alliances context: past, present and future. <i>Journal of Knowledge Management</i> , December.	Bamel, N., Pereira, V., Bamel, U., & Cappiello, G.	2021	This paper aims at reviewing the extant knowledge management (KM) research field within a strategic alliance context to understand the historical roots, its temporal progression, current state and potential future in a meaningful way	Data for this study was retrieved from the Scopus database using a systematic literature search process.	The findings of the study suggest that the publication in the field have been growing with an average rate of 8.48%.
Knowledge management and organizational performance in the service industry: The role of transformational leadership beyond the effects of transactional leadership. <i>Journal of Business Research</i> , 67(8), 1622–1629.	Birasnav, M.	2014	This study examines a comprehensive model comprising of various relationships between transformational and transactional leadership, knowledge management (KM) process, and organizational performance.	Exploratory factor analysis and hierarchical regression analysis	The results indicate that transformational leadership has strong and positive effects on KM process and organizational performance after controlling for the effects of transactional leadership.
The impact of knowledge tasks and roles on firm success and performance: A structural model. <i>International Journal of Knowledge Management Studies</i> , 4(3), 265–280.	De Giovanni, P.	2010	This paper investigates the benefits gained by firms when driven by the Knowledge Manager (KM).	Quantitative Analysis	Finally, the research ends providing the scales of the most important roles and tasks, underlining which of them impacts mostly on firms' success and economic performance.
The role of digital innovation in knowledge management systems: A systematic literature review. <i>Journal of Business Research</i> , 123(September 2020), 220–231.	Di Vaio, A., Palladino, R., Pezzi, A., & Kalisz, D. E.	2021	This article investigates the literary corpus on digital innovation in knowledge management systems (KMS) to understand its role in business governance.	Bibliometric Analysis	These findings especially highlight the links between innovation and sustainability

Unlearning: A systematic literature review. <i>International Journal of Business and Globalisation</i> , 24(4), 472–495.	Durst, S., Heinze, I., Henschel, T., & Nawaz, N.	2020	This paper aims to provide a systematic review on the topic of unlearning (and	Systematic review	The findings contribute to a more holistic understanding of the topic and complement extant literature on unlearning.
The linkage between knowledge risk management and organizational performance. <i>Journal of Business Research</i> , 105(August), 1–10.	Durst, S., Hinteregger, C., & Zieba, M.	2019	The purpose of this study is to examine the effect of knowledge risk management (KRM) on organizational performance, with measures considered as “softer” measures of performance, i.e. innovativeness, responsiveness, sustainability, and agility. Data	Data collection, questionnaires	They could use the results to design their KRM practices accordingly. To the authors' best knowledge, this paper is the first empirical study that has investigated the relationship between KRM and organizational performance with a broad organization sample.
Knowledge risks inherent in business sustainability. <i>Journal of Cleaner Production</i> , 251, 119670.	Durst, S., & Zieba, M.	2020	The aim of this conceptual paper is to address two main questions: What are the potential effects of knowledge risks on the three dimensions of sustainability in organizations? and How can organizations cope with knowledge risks to become truly sustainable? Taking	Conceptual paper	To conclude, the paper offers a new perspective on business sustainability, i.e. the perspective of knowledge risks and in a broader sense, KM. On the basis of the presented analysis, it seems that the underlying notion of KM is predestined for the underlying notion of sustainable business development.
Knowledge Management in the Fourth Industrial Revolution: Mapping the Literature and Scoping Future Avenues. <i>IEEE Transactions on Engineering Management</i> , 68(1), 289–300.	Fakhar Manesh, M., Pellegrini, M. M., Marzi, G., & Dabic, M.	2021	the present article investigates the intellectual structure and trends of KM in Industry 4.0.	Bibliometric analysis and a systematic literature review	The results reveal six clusters of keywords, subsequently explored via a systematic literature review to identify potential stream of this emergent field and future research avenues capable of producing meaningful advances in managerial knowledge of Industry 4.0 and its consequences.
The role of AI-based technology in support of the knowledge management value activity cycle. <i>Journal of Strategic Information Systems</i> , 9(2–3), 107–128.	Fowler, A.	2000	The paper evaluates the phenomenon of knowledge management (KM) and its relationship to the artificial intelligence (AI) technologies of knowledge-based systems, case-based reasoning and neural networks.	Data gathered through interviews and multiple visits	The study thereby illustrates both the potential and the limitations of AI technologies in terms of their capability to support the KM process.

Knowledge management: A global examination based on bibliometric analysis. <i>Technological Forecasting and Social Change</i> , 140(March 2017), 194–220.	Gaviria-Marin, M., Merigó, J. M., & Baier-Fuentes, H.	2019	This article presents a bibliometric overview of the academic research on KM in the business and management areas. Various	Bibliometric method	The results show that research in this field has increased significantly in the last ten years and that the USA is the most influential country in all aspects in this field. It is important to consider, however, that science continues to advance in this and in all fields and that data rapidly change over time. Therefore, this paper fulfills an informational role that shows that most of the fundamental research of KM is in business and management areas.
Business model innovation through the application of the Internet-of-Things: A comparative analysis. <i>Journal of Business Research</i> , 126(December 2020), 126–136.	Haaker, T., Ly, P. T. M., Nguyen-Thanh, N., & Nguyen, H. T. H.	2021	To better understand emerging IoT business models in Vietnam through identifying and interpreting business model design options and choices.	Morphological analysis and	The research provides insights into the commonalities and discrepancies of IoT-based business models. Also, it provides a novel application of morphological analysis to business model innovation to create a generic business model for IoT applications in emerging markets.
Knowledge management and business intelligence: The importance of integration. <i>Journal of Knowledge Management</i> , 9(4), 45–55.	Herschel, R. T., & Jones, N. E.	2005	The purpose of the paper is to provide a thorough analysis of the difference between business intelligence (BI) and knowledge management (KM) and to establish a framework for relating one field to the other.	A review of the literature from approximately 1986 through 2004 time period	BI focuses on explicit knowledge, but KM encompasses both tacit and explicit knowledge. Both concepts promote learning, decision making, and understanding. Yet, KM can influence the very nature of BI itself. Hence, this paper explains the nature of the integration between BI and KM and makes it clear that BI should be viewed as a subset of KM. Originality/value
The relationship between the Internet of Things and knowledge management in smart ecosystem development. <i>Knowledge and Process Management</i> , April 2020, 1–14.	Ikeda, E. K., da Silva, L. F., Penha, R., & de Oliveira, P. S. G.	2021	To explore the relationship between IoT and Knowledge Management (KM) when generating a Smart environment. Herein,	Systematic Literature Review	Evidence that the IoT is composed of a set of technologies that enable KM and KM processes can facilitate the development of IoT Smart environments. Thus,

Classifying the Business Model Types of International Construction Contractors. <i>Journal of Construction Engineering and Management</i> , 146(6), 04020056.	Jang, Y., Song, K., Park, M., & Ahn, Y.	2020	Understanding existing business model types is a crucial part of business model innovation since business model types represent the status of current business models and hint toward business model innovation.	Empirical	The results suggest the existence of three business model types used by international construction contractors and indicate significant performance differences among them. Our
COVID-19 crisis and SMEs responses: The role of digital transformation. <i>Knowledge and Process Management</i> , December 2020, 1–17.	Klein, V. B., & Todesco, J. L.	2021	This article discusses the general weaknesses, strengths, challenges and opportunities for SMEs to face this pandemic, and how the field of knowledge management (KM) can help. Based	Systematic Literature Review	As practical implications, research raises awareness of digital transformation's role as a set of tools to adapt during and after the pandemic, along with resilience engineering and knowledge management principles.
Knowledge management, intellectual capital and entrepreneurship: a structured literature review. <i>Journal of Knowledge Management</i> , 24(8), 1797–1818.	Paoloni, M., Coluccia, D., Fontana, S., & Solimene, S.	2020	The purpose of this paper is to analyze within the knowledge management (KM) stream the relationship between KM and intellectual capital (IC) and entrepreneurship (E). IC	Systematic Literature Review	There is an urge to move the focus of KM and IC research toward new models of their interconnection, by including the social capital, namely, knowledge capabilities (explicit or not) which are able to turn knowledge in innovation and competitive advantage, from an accounting perspective (recognizing IC's components affecting the performance of firms, among which knowledge is the most important) and from a theoretical point of view (reducing the misalignment between the epistemological concept of KM requirements and the effective perception of organizational KM activities to extract value from KM initiatives).

Challenges for Knowledge Management in Digital Business Models. 2020 10th International Conference on Advanced Computer Information Technologies, ACIT 2020 - Proceedings, 555–558. ### **Abstract**

Regional labels are intended to be a credible signal that helps simplify the information flow between the food producers and consumers about certain food products' characteristics (mainly origin and quality). Presented paper shows results of the research on the consumer buying behaviour towards regional food in Pilsen Region in the Czech Republic and their recognition of the regional labels. The main goal of this study is to identify critical factors for regional food consumers' segmentation that would be of assistance to small and medium enterprises (SMEs) in the Pilsen Region, the food producers that want to improve their marketing approach on the regional food market. Results add to a longitudinal research that aims to study evolution of Czech regional labels and their role in support for

the local SMEs. The paper builds on the qualitative data gathered on this topic previously and on-line quantitative research that was conducted in January – February 2020 in the Pilsen Region. Data from 258 respondents were processed. The application of decision trees analysis demonstrates the dominant influence of socio-demographic factors, such as age and education, on the respondents' buying choices of the regional food.

**Keywords** – customer buying behaviour, regional food preferences, decision tree analysis

**Paper Type** - Academic Research Paper

## 1 Introduction

Emphasis on the regional origin of food products and traditional manufacturing methods is becoming a solid alternative to the mass production and consumption (Bryla, 2015; Fraser and Balcombe, 2018; Meyerding et al., 2019). It is evident that consumer decisions are complex and multifaceted and only some prioritise origin above all factors when shopping for food (Delicato et al., 2019; Sadílek, 2019). However, a focus on regional origin and quality, demonstrated by the use of the regional label, may be a viable marketing strategy, especially for the small and medium food producers (Hashem et al., 2018; Imene and Georges, 2014; Gracia and DeMagistris, 2014). In general, the food labels inform consumers about certain aspects of the food or its production method, often with a logo or a statement on the product (Bingen, 2012; Doherty and Campbell, 2014). It provides information that the food meets given standards (e.g. it is produced in a certain geographic area), or is in accordance to additional requirements (Eldosouky et al., 2019; Weinrich and Spiller, 2016). Regional labels represent a strong connection between the product and its place of origin, signalling above all authenticity and genuineness (Fonte, 2010; Forney and Häberli, 2016). Food producers may use built and established associations consumers have with the region, which will help create a specific image for their production (Ilbery et al., 2005). Regional labels also have undeniable importance for consumers, as they provide strong safety and quality assurance, and contribute to their simpler orientation on the market (Cichocka, Oleniuch, 2017).

The Czech food market is highly competitive, and the food producers may choose from the wide range of food labelling systems that signal origin and quality (Bošková et al., 2016; Chalupova et al., 2021; Vokáčová et al., 2017). According to Stoklasa and Pitrunová (2020), regional food is strongly preferred by

the Czech consumers, but their research has indicated that there is a discrepancy between how the regional labelling schemes communicate about the labelled regional food and how consumers perceive them. The authors suggested that the regional labels should compromise and present the labelled regional food as a product that is unique, yet traditional, also more expensive, which reflects a good quality and environmental friendliness, and it represents a form of support of the region. Some researches (Chalupová et al., 2016; Margarisová et al., 2018; Velčovská, Del Chiapa, 2015; Rojík et al., 2016) also suggest that the regional labels in the Czech Republic still suffer from relatively low awareness among customers. According to Sadílek (2019), price, origin and appearance are the most important factors for the Czech consumers when buying food. Almost a quarter of all respondents expressed a positive attitude towards food quality labels, they were primarily men with a university education, living in two- to five-person households, claiming to have above-average earnings. Research of Stoklasa and Pitrunová (2020) also showed that the respondents with university education favor regional labelled food; they fall into the age groups of 26-35 and 36-45.

It is apparent that there is a steady interest among professionals in the Czech Republic about consumer preferences regarding regional food, yet the studies about the regional food buyers' preferences and attitudes in specific regions are quite limited. The aim of this paper is to identify important factors for regional food consumers' segmentation that would be of assistance to SMEs in the Pilsen Region, the food producers that want to improve their marketing approach on the regional food market. Results will add to longitudinal research that aims to study an evolution of Czech regional labels and their role in support for the local SMEs.

## **2 Regional Labelling Systems in the Czech Republic**

There are three major umbrella regional labelling schemes in the Czech Republic. At the EU level, there are schemes of geographical indications: Protected Designation of Origin (PDO) and Protected Geographical Indication (PGI). At the national level the project Regional Food of the Ministry of Agriculture of the Czech Republic (and its State Agricultural Intervention Fund) has a major role. It was established in 2010, it runs as a top-down scheme. As an important outcome of this project is the label 'Regional Food' present in all the Czech regions at the NUTS 3 level. It has a form of competition for local small and

medium producers and agriculturists, it operates as a top-down scheme. The project's strategic goal is to improve the consumers' awareness of the regional food and using the marketing communication to promote its benefits, emphasizing the advantages of the local food preference in relation to the development of a region - support of employment, tourism and sustainability (Czech Ministry of Agriculture, 2021). Association of Regional Brands (ARB) is a nonprofit organization that associates the coordinators of the member regional labels representing 27 regional and micro-regional labels, it runs as a bottom-up scheme. The first regional labels in the Czech Republic were established in 2005 (Krkonoše, Beskydy Mts. and Šumava Mts.), the Association has been created three years later. All of the labels associated in ARB are recognisable with the unified graphic design and common granting principles. The products and services need to have a guaranteed origin, respect for the environment in all phases of both production and sale proportion of manual or mental work and local raw materials is being required. The certificates can be obtained by SMEs, producing food and handicraft, and service providers within tourism (Čadilová, 2011). Other labels based on the similar principles as ARB designation (but operating outside the Association), are representing the micro-regional level, include Lužické Mts. and Macha Region Regional Product, Jizerske Mts. Regional Product, Quality from the Hlinec Region, Real Walachian®, Bile Karpaty Tradition, Traditional Product of Slovacko, Vltavotynsko Regional Brand) and Original product of Sokolovsko (Vokáčová et al., 2017).

### **3 Pilsen Region and its Regional Labels**

The Pilsen Region lies in the southwest of the Czech Republic, the region is ideally positioned between the capital of Prague and western European countries. It is the the third largest region in the Czech Republic, the center of the region is the city of Pilsen. Typical feature of the area is the high number of small settlements, almost third of the region's population resides in small towns and villages (Pilsen Region, 2021). There are four regional labels in the Pilsen Region: Regional Food Pilsen Region (as a part of the project Regional Food of the Ministry of Agriculture of the Czech Republic), Šumava Regional Product is part of the ARB (Šumava Mts fall geographically into both Pilsen and South Bohemia Regions) and Local Product from West Bohemia and Český les (Czech Forrest) labels are administered by the Local Action Groups (see Fig. 1).

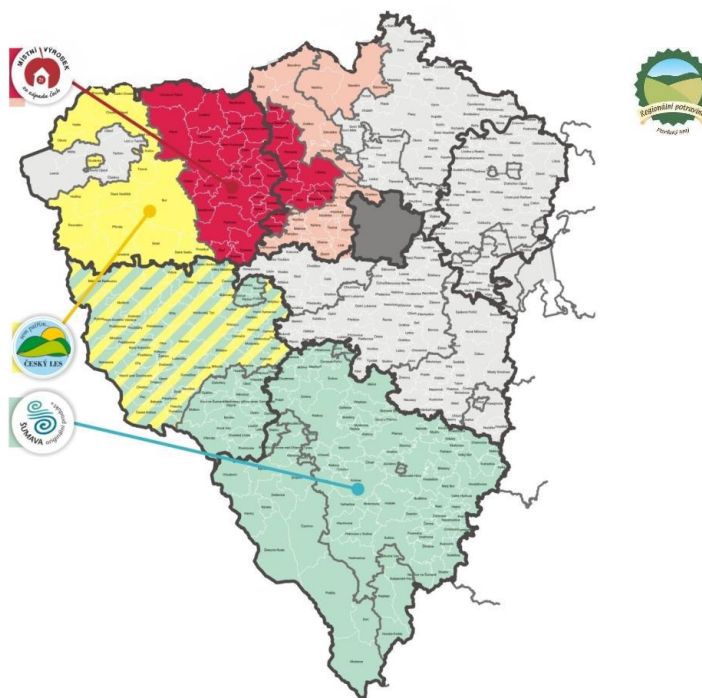

Figure 1 Regional Labels of Pilsen Region

Local Product from West Bohemia	Český les (Czech Forrest)	Šumava Regional Product	Pilsen Region Regional Food

Source: [www.mas.cz](http://www.mas.cz), 2021

The Pilsen Region Regional Food of the label supports small and medium-sized producers of agricultural and food products in the region. The label is administered by the Ministry of Agriculture, which also awards the label in the form of a certificate based on the decision of the evaluation committee in the relevant region. The coordinator of the label for the Pilsen Region is a public service company Úhlava. The products awarded this label are promoted not only

in the region of the Pilsen Region where they were produced, but also throughout the Czech Republic. Nationwide, around 100 producers receive the Regional Food award each year, and in the Pilsen Region there are 8-9 producers each year. (Regional Food, 2020)

The label Šumava - Original Product is part of the ARB, it is awarded to artisanal products (including food), agricultural products and natural products by the Šumava Regional Development Agency, which is the coordinator of the label. The label can be awarded also to accommodation and catering services, experiences and traditional events. The Šumava region was one of the first regions to join the labelling project and the first certified products appeared as early as 2006. In May 2021 there were 74 certified products.

The Český Les (Czech Forrest) regional label helps consumers to identify products originating in the Český les region since 2013. The local inhabitants of Domažlice and Tachov support the preservation and creation of new traditions with their products. Certified regional products guarantee the origin of the products and its quality, they must also be unique, original products with a tradition of more than 50 years in the region. In May 2021 there were 22 certified products.

The Local Product from West Bohemia label began to be awarded in 2010 to local producers, craftsmen, farmers, and other small businesses operating in the territory of the Local Action Group Český Západ (LAG Czech West) and its surroundings. In order to be certified, products must meet at least two of the specified criteria: the use of local ingredients, recipes and processes; the use of handicraft, artisanal or intellectual work of local people; and production and sale in the micro-region. In May 2021 there were 25 certified products.

#### **4 Materials and methods**

The research has been made with the use of on-line questionnaire in January-February 2020 among inhabitants of the Pilsen Region in the Czech Republic. Data from 258 respondents were processed, the chosen socio-demographic characteristics included gender, age, education, monthly income (see Table 1). The questions also focused on the buying behavior (frequency, preferred type of retailers) and the importance of the selected attributes that the regional food labels represent.

Table 1 Socio-demographic characteristics of the respondents

Criterion	Respondents from Pilsen Region		
	Group	Abs. frequency	Rel. frequency
<b>Total</b>	<b>Population aged 19-51+</b>	<b>258</b>	<b>100.00</b>
<b>Gender</b>	Male	91	64.7%
	Female	167	35.3%
<b>Age</b>	19-35 years	172	66.7%
	36-50 years	58	22.5%
	51+ years	28	10.8%
<b>Education</b>	High school without a graduation	44	17%
	High school with a graduation	112	43.4%
	University degree	102	39.6%
<b>Household income</b>	Less than 25,000 CZK/month (approx. 1000 EUR)	42	16.3%
	25,001 – 50,000 CZK/month (approx. 1001 – 2000 EUR/month)	142	55%
	More than 50,001 CZK/month (2001 EUR/month)	74	28.7%

Source: Authors

Data in Table 1 show that the largest group of respondents were women aged 18-35 with a net monthly income of CZK 25,001-50,000 (approx. 1001 – 2000 EUR/month), and the highest level of education attained was university or high school with a graduation.

Obtained data were processed using decision tree analysis, processing them using CHAID (Chi-squared Automatic Interaction Detection) in IBM SPSS that allows identification of the important factors affecting consumers' decisions (O'Flaherty, Heaven, 2015; Song, Kim, 2018). Decision trees generally follow a top-down approach; every internal node in a decision tree contains a question about one particular feature (f.e. buying decisions) and every branch shows the result of the statistical testing using Chi-square for the categorical dependent variable and the F-test for the continuous variable (Jovanović et al., 2017).

## 5 Results and discussion

We have focused on identifying variables that the respondents' regional food buying choices are dependent on. As it is visible from Figure 2, the regional food

preference in the Pilsen Region depends strongly on age. Among the respondents who belong to the age groups within the interval of 35 and 65, only 1.2% don't prefer the regional food. On the other side, age was the sole dependent variable (the preference of the regional food is not dependent on other examined variables, such as education, income and gender).

When examining respondents aged 18-35 years, their preference of the regional food is quite strongly influenced by their education. Slightly more than 22% of respondents with the university degree always prefer the regional food. Also researches by Sadílek (2019) and Stoklasa and Pitrunová (2020) suggest that the education plays a crucial role when making decisions about the food purchases (in terms of the preference of its origin).

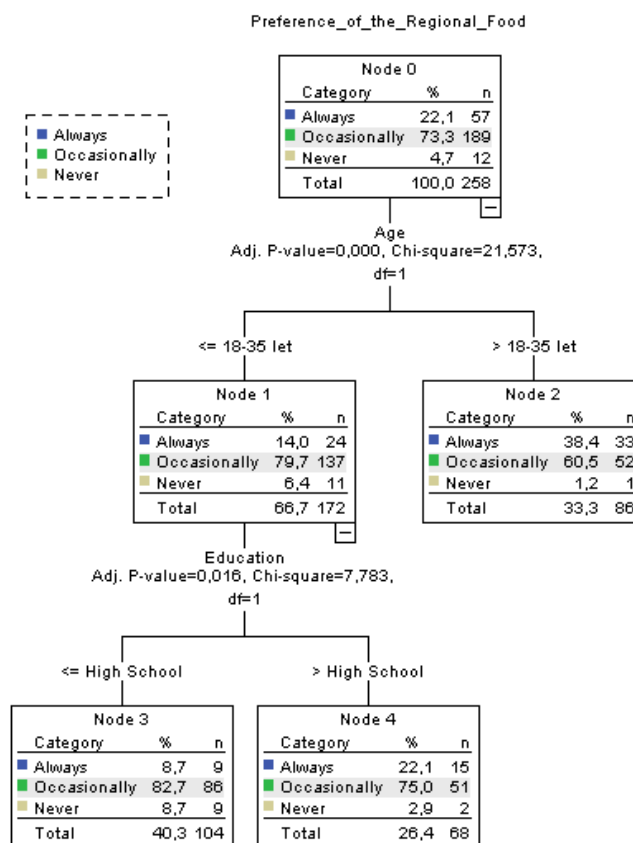

Figure 2 Preference of the regional food in the Pilsen Region in dependence on the chosen sociodemographic characteristics  
Source: Authors

Test of aided awareness of Pilsen Region regional labels showed that the respondents know the most about the existence of Regional Food Pilsen Region as 73% (187) claimed that they noticed the logo when shopping for food. It is not surprising as the Regional Food label has gradually gained a significant importance on the Czech market, being present in every region and using a extensive marketing support from the Czech Ministry of Agriculture (Margarisová et al., 2018). Other examined regional labels (which represent micro-regions within the Pilsen Region) are being recognised significantly less. Only 12% (30) of respondents indicated they are aware of the Czech Forrest label; 35 (14%) have come across Šumava Original Product label and only a minimum of respondents, 8% (21), have claimed they have noticed the logo of Local Product of West Bohemia. Similar situation has been observed in the Vysočina Region (Chalupová et al., 2016) and South Moravia (Rojík et al., 2016).

Awareness of the Pilsen Region regional labels was also tested with dependence on chosen socio-demographic characteristics of respondents, using decision tree analysis. As it is visible from Figure 3, awareness of the regional label Czech Forrest depends on the respondents' income level. Respondents with an income at the level above 50,000 CZK/month (approx. 2000 EUR) recognise the label the least (only 2.7% of them know it) compared to the income group up to 50,000 CZK/month where the awareness of the brand is at the level of 15.2%. In the income group up to 50,000 the awareness of the label also depends on the age. The brand is better known among the respondents within the age group over 35 years (25% of respondents in this group claimed to be aware of the label), than in the age group within the range of 18-35 (only 10.9% of respondents have recognised it).

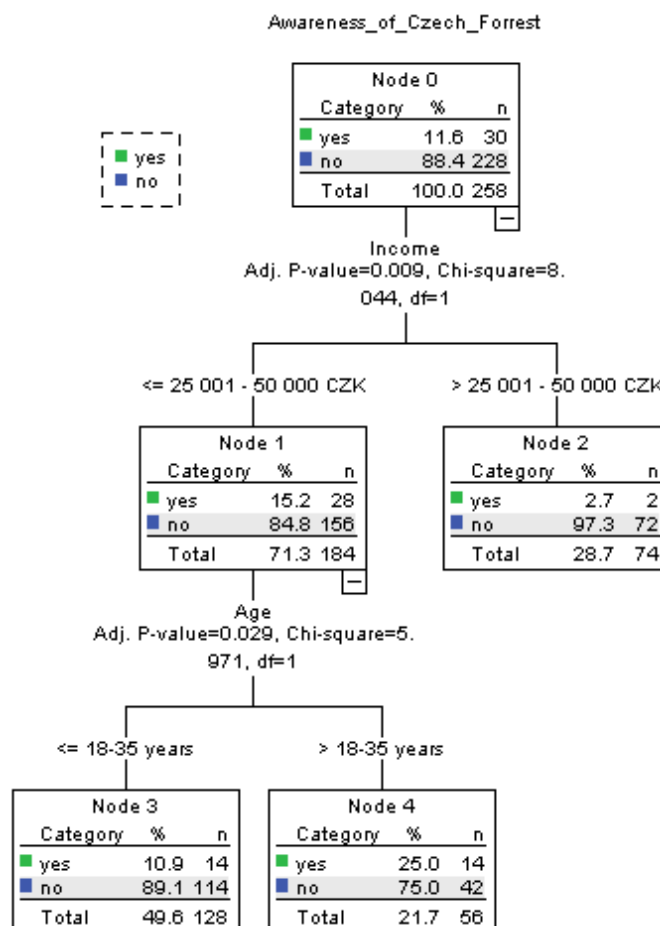

Figure 3 Awareness of the regional label Czech Forrest in the Pilsen Region in dependence on the chosen socio-demographic characteristics  
Source: Authors

Awareness of the regional label Local Product from West Bohemia also depends on income level (see Figure 4). Respondents with an income at the level up to 50,000 CZK/month (approx. 2000 EUR) recognise the label better; 11.1% of respondents have noticed it when shopping for food. Only 1.4% of respondents with an income higher than 50,000 CZK/month have come across it. Within the respondents with the income at the level up to the 50,000 CZK/month, the familiarity with the logo also depends on gender. Women (14.5%) are more likely to know the brand than men (4.8%).

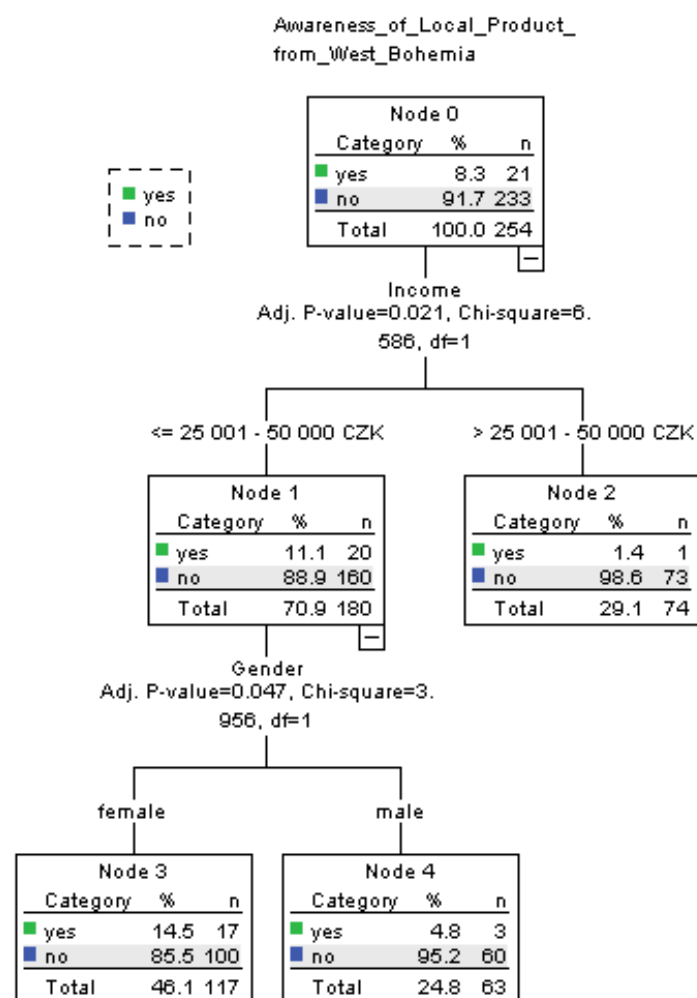

Figure 4 Awareness of the regional label Local Product of the West Bohemia in the Pilsen Region in dependence on the chosen sociodemographic characteristics  
Source: Authors

We did not find any statistically significant dependencies on age or income group, gender or education for the other two regional labels.

Our research has also focused on the consumers' perception of the labels. The coordinators of the regional labelling schemes make an effort to connect the labels with the higher quality and environmental friendliness, presenting the winners of the labelling competitions as the holders of the prestigious label (Vokáčová et al., 2017). Figure 5 shows that the respondents view the labels predominantly to support their region: the most substantial connection is to the

label Šumava Original Product (80%) and Regional Food Pilsen Region (73.5%). Respondents have connected the ecological characteristics of the products more significantly only with the label Local Product of West Bohemia (22.7%).

Figure 5 Regional labels in the Pilsen Region – how respondents perceive them  
Source: Authors

Only few respondents view the presented regional labels as a signal of prestige or higher quality. It is in line with the research of Stoklasa and Pitrunová (2020), who have pointed out that there is a discrepancy between the marketing communication of the regional labelling schemes about the labelled regional food and how consumers perceive it.

## 6 Conclusion

As any other customer-centred company, food producers in the Pilsen Region should understand their customers and make marketing decisions based on the data about them. Our research indicates that the regional SMEs should focus their attention on the segment of the customers within the age group 18-35, with the higher education level and net monthly income of CZK 25,001-50,000; with the inclination to support their region. As the awareness of the regional labels is relatively low (except the label Pilsen Region Regional Food), coordinators of the regional labelling schemes of Czech Forrest, Šumava Original Product and Local Product from West Bohemia should invest more in their marketing campaigns to gain wider general knowledge among the inhabitants of the Pilsen Region.

We would suggest that also they should better target their activities and improve their brand marketing regarding the labels' positioning, focusing on the connection of the labels with their specific parts of the Pilsen Region, representing its support, building on already strong existing association. It could be a way to build more vital awareness and trust in the regional labels. Our results should be interpreted in the context of the limitations of the research. As it is based on self-reported data, it is understandable that the respondents tend to overestimate their awareness of the labelling and their buying decisions of the regional food. Another limitation is the sample of respondents, as the largest group of respondents were women aged 18-35. These limitations have a potentially significant impact on the generalizability of the findings, and thus on the contribution of this study toward a better understanding of consumers behaviour related to regional food labels in the Pilsen Region. In the future, the research is repeated with a larger sample of respondents and a better structure of specific demographic categories, with a focus on the respondents' attitudes toward the region. Information from the research could be applied in marketing communication campaigns and help SME food producers make proactive and knowledge-based decisions.

### Abstract

These days, business competition is more among supply chains (SCs) than between individual firms. So, knowledge is a critical resource that must be managed properly not only in single companies but also across SCs. Indeed, managing knowledge within a SC can help companies to promote better use of resources and gain value for customers. From a knowledge management (KM) perspective, this implies a shift of focus, from traditional intra-organizational KM practices to inter-organizational KM. Despite the increasing importance of KM in SCs, its implementation can still encounter several barriers, which must be investigated. This can help both research and practice on this topic. However, the current KM literature is very varied, and in the available studies, there is a lack even of basic definitions and classifications. In line with this, barriers affecting the implementation of KM practices in SCs are not presented in a comprehensive and consistent way, and not systematically categorized in line with KM practices in a way where firms can manage them easily. This study aims to highlight the contribution of previous related studies and investigate and re-categorize the potential barriers affecting the introduction and development of KM practices in SCs. An in-depth and up to date systematic literature review (SLR) was carried out as a means of evaluating and interpreting all available

research relevant to the research topic. A total of 831 papers indexed in international citational databases (Scopus and WoS) were undergone evaluation process, and the content of a selection of papers was classified and analysed. This study makes a first attempt to provide a comprehensive list of 51 KM barriers re-classified into three categories namely, barriers related to the use of KM methods, barriers related to the KM application of IT tools, and barriers related to the KM-enabling supportive management measures. Theoretically, this study proposes a fresh contribution to explore the KM literature in SCs, specifically barriers to KM implementation. The main points that emerged which are particularly important include: i) summary of existing studies on barriers; ii) identification and re-classification of potential barriers which are the key factors affecting the adoption of successful inter-organizational KM. This will also help managers to systematically manage hindering factors and use properly the potential practices in their KM programs collaboratively with their SC partners.

**Paper type** – Academic Research Paper

## 1 Introduction

In the current knowledge-based and digitalization era, knowledge is a critical resource of firms that has to be managed properly and strategically for performance improvement and competitiveness. Bolisani *et al.*, (2017) states that though the issue of how companies should plan their knowledge management (KM) activities is still a debated issue, recognition of KM as a strategic element of today's companies is increasing.

Indeed, KM applications can be seen either at intra-organizational or inter-organizational level. The majority of KM studies covers the intra-organizational level, where inter-organizational KM has been less studied (Cerchione and Esposito, 2016; Lim *et al.*, 2017; Thomas *et al.*, 2017). In addition, intra-organizational studies of KM have covered all the main KM aspects (Edwards, 2015), i.e., Knowledge content, Processes, People, Technology/KM System, and Structure and knowledge strategy. Whereas, studies focusing on inter-organizational KM tend to focus on specific aspects of KM such as processes of knowledge sharing and transfer, technologies for knowledge transfer, and collective learning (Kassaneh *et al.*, 2020). The importance of inter-organizational KM is related to the need to manage knowledge across the organizational boundaries. Knowledge must be managed not only in single companies but also

across SCs, because competition is more and more among SCs than between individual firms (Attia, 2015; Shakerian, Dehnavi and Shateri, 2016). In addition, knowledge in SC connections can require special measures to be managed (Rodríguez-Enríquez *et al.*, 2015; Thomas *et al.*, 2017).

Scholars increasingly see the development of “knowledge-based SCs” as an opportunity to improve value for customers (Wadhwa and Saxena, 2005) and to promote better use of resources in knowledge-intensive and multi-cultural enterprises (Samuel *et al.*, 2011). However, while SC management and KM are two important research streams, few works have treated the link between them (Samuel *et al.*, 2011). During the past 20 years, especially in the last decade (Kassaneh, Bolisani and Cegarra-Navarro, 2021), key contributions have been published and some studies (Marra, Ho and Edwards, 2012; Lim *et al.*, 2017; Chen, Ellis and Holsapple, 2018) support that there is a growing interest in applying KM to SCs.

In addition, despite this rising interest, the implementation of KM in SCs can still encounter several barriers, which must be investigated since it can contribute both to the theory and the practice. On this issue, the current literature is very varied. In the available studies, there is a lack even of standard definitions and classifications. There are limited studies on KM practices exercised by firms in SCs, and on the associated potential factors affecting KM adoption and development in SCs (Cerchione and Esposito, 2016; Inkinen, 2016; Li and Kang, 2019). Specifically, there are some studies on KM barriers in SCs (such as: Patil and Kant, 2014b, 2014a; Zerbino *et al.*, 2018; Batista *et al.*, 2019) but these provide fragmented views, and a unified vision or perspective has not emerged so far.

Thus, this review aims to highlight the contribution of previous studies and investigate the potential barriers affecting the introduction and development of KM practices in SCs. Further, the paper describes an attempt to classify KM barriers in line with a recently proposed classification of KM practices (Kassaneh *et al.*, 2020; Kassaneh, Bolisani and Cegarra-Navarro, 2021). From a scientific perspective, the achievement of this objective could fill the literature gaps we highlighted and could provide an up-to-date overview of the barriers to KM implementation in SCs. From a practical viewpoint, a study on KM barriers, that hinder companies’ effort to properly interact with the SC partners for a collaborative learning, will provide lessons to managers on how to handle these barriers and improve practices for knowledge creation, sharing, protection, and KM application for better firm and SC performances.

The article is structured as follows. Section 2 briefly describes the methodology. Section 3 presents the analysis of selected papers, and the discussion part. In this section, a descriptive quantitative analysis of the literature is presented, followed by a content analysis. The analysis of the contribution and limitations of the previous studies on KM barriers in SCs, and the identification and re-categorization of these barriers are included in this section. Section 4 proposes a brief comparison to other existing literature reviews on the same topic. The final section summarizes importance of the study, for research and practice, and the future directions of research.

## **2 Review Methodology**

An in-depth systematic literature review (SLR) was used. It is an overview of primary studies that uses explicit and reproducible methods (Greenhalgh, 1997) following a rigorous procedure of searching, with a five steps strategy (Xavier *et al.*, 2017; Martins *et al.*, 2019) which includes:

- i. Formulation of the research question
- ii. Studies location (searching studies using keyword definition and data base selection).
- iii. Selection and evaluation of studies using inclusion/exclusion criteria.
- iv. Analysis and synthesis of the selected articles and findings.
- v. Reporting and use of results for further action.

### **2.1 Research question for the SLR**

Based on the research goals and gaps mentioned in section 1, the following two research questions are addressed in this SLR.

*RQ1: How does the trend of KM for SC look and which topics (related to the factors) are most importantly covered (or not covered) in the area?*

*RQ2: Based on the current literature, what are the potential barriers affecting firms' KM practices in SCs?*

### **2.2 Paper search strategy using keyword definition and database selection.**

Since the general focus of the study is to see the KM issue in the SC perspective, the articles must contain both KM and SC issues. Accordingly, the selected keywords included: "knowledge management", "knowledge creation",

"knowledge acquisition", "knowledge storage", "knowledge sharing", "knowledge transfer", "knowledge application", and "Knowledge protection" in combination with "supply chain". Web of Science and SCOPUS were used as they are two authoritative large databases and have multidisciplinary articles.

### **2.3 Paper selection process**

The retrieved papers were further selected based on the following criteria:

- Focus of the paper: one or more KM practices, or KM adoption and development factors, technologies, methods/tools, strategies in SC perspectives.
- Articles in peer-reviewed journals indexed in the SCI or SSCI index (Web of Science database), and the Scimago index (Scopus)
- Articles in subjects: business and economics, management, operations research and management sciences, industrial engineering, information system, and related fields
- Articles written in English language and published from January 2000 to December 2019 (to see the research trend in the last two decades)

According to the above-mentioned search strategy and inclusion/exclusion criteria, a total of 831 papers were undergone the initial evaluation process (i.e., article title reading, abstract reading and full paper reading). Finally, 65 papers were considered pertinent and were selected for further descriptive and content analysis.

### **2.4 Analysis and synthesis of selected papers**

Descriptive and content analysis were conducted. In the descriptive analysis, the papers were categorized by the following three perspectives to give a summary view of the selected papers and the research field.

1. By publication year (to see the trend of the research field)
2. By unit of analysis (firm level, SC level or network level)
3. By the type of factors covered in the studies (enablers/critical success factors or barriers)

In the content analysis, papers were reviewed and studied in-depth and important points regarding KM associated barriers were extracted. The main issues in this part, which are reported in the subsequent section, include: context,

categorization, limitations of studies, identification and re-categorization of influential barriers hindering firms' KM practices in SCs.

### 3 Result and discussion

#### 3.1 Descriptive analysis

##### 3.1.1 Categorization of papers by publication year (20 years trend)

Figure 1 shows that for the past 20 years, there has been an increasing trend of papers focusing on "KM in SC". Specifically, in the last decade, the trend displays a significant growth and a promising need for further study.

Figure 1. Distribution of papers by publication year

##### 3.1.2 Classification of papers by unit of analysis

Papers were also classified by the unit of the analysis i.e., firm level, SC level or network level. With this respect, most papers (54%) have a firm level focus as shown in figure 2. Here, it can be noticed that analysis of KM issue at SC level or network level is difficult as it is not easy to manage knowledge across all SC members compared to managing knowledge in a single firm. This signals that KM practices at SC level or network level are at low level of implementation, and thus, the need for the investigation of the associated barriers is significant.

Figure 2. Classification of selected papers by unit of analysis

### 3.1.3 Analysis of papers by the type of KM factors considered in the studies

This analysis was conducted to investigate how many papers in the KM-SC field have considered "factors affecting the KM activities" in their studies. In this case, about 65% of the studies (figure 3) included the issue of KM factors in their discussions and the rest of the studies do not considered it. However, very few studies (8 papers or 12%) discussed the barriers affecting KM in SCs while most studies have focused on KM enablers. In the case of limited implementation of KM in SCs, further research on factors hindering KM is necessary, and more attention must be given to this research topic.

Figure 3. Classification of selected papers by their focus on factors

### 3.2 Content analysis

#### 3.2.1 Barriers affecting adoption and development of KM in SCs

Before we dive into the investigations of potential barriers, it is first necessary to summarise the lists of barriers that the (few) previous studies identified regarding KM in SCs, how they are categorized, and the possible associated limitations. From the preliminary literature review, it was found that there was little research on factors (both enablers or barriers) influencing KM adoption and development in SCs (Cerchione and Esposito, 2016). Some studies (Zerbino *et al.*, 2018; Li and Kang, 2019) indicate there are some studies of KM enablers or success factors, but very few papers on barriers to KM (only 12% of the sample, as presented in section 3.1.3). In this regard, our review highlights the contribution and the limitations of these previous studies on barriers to KM in SCs. A summary is presented in table 1.

Three important papers (Patil and Kant, 2014a, 2014b; Zerbino *et al.*, 2018) analysed KM barriers in SCs, and strategic and organizational barriers such as: lack of top management commitment, KM not integrated in business processes, and lack of proper organizational structure were found the most important barriers of KM adoption in SCs. On the other hand, it is necessary to remark that the studies have limited scope, insufficient empirical validation, and tend to present country specific cases. This shows that there is insufficient coverage of the possible challenges specific to KM related business activities. This is also supported by the findings of the SLR made by Cerchione and Esposito (2016) which states that the barriers to the adoption of KM in SCs are scarcely analysed and there is a need for a systemic approach to identify and analyse the whole set of barriers. Thus, this lack of study of barriers affecting KM practices in SCs in a more comprehensive view is a key issue.

Table 1 Summary of previous studies on barriers for KM in SCs

Authors	Authors' contributions	Limitations
Bagheri, Kusters and Trienekens, (2019)	Identified 9 barriers for customer knowledge transfer	Focus only on Customer knowledge transfer challenges in a value network setting
Batista <i>et al.</i> , (2019)	-Identified 10 KM processes implementation barriers and classified in to 3 categories (technology, organization & people related) -Knowledge Creation related (2), storage related	Focus only on barriers faced by an SME attempting to implement KM (adoption phase) in the food SC

	(4), application related (2), Sharing related (2)	
Kovács and Spens, (2010)	Suggested 'Competition b/n organizations as a barrier for Knowledge sharing in relief SCs	Not full focus on barriers
Li and Kang, (2019)	Investigated that the competition or rivalry side of the "co-opetition" r/ship acts as the major barrier for knowledge sharing due to the sharer's concern of knowledge leakage	Not full focus on barriers but proposal of a single factor
Mclaughlin, (2009)	Recommended 'Over dependency on technology' as a barrier for Knowledge sharing	Not full focus on barriers but proposal of a single factor
Patil and Kant, (2014a, 2014b)	-28 total barriers were identified and categorized as strategic, organizational, technological, cultural, individual. -Barriers were also ranked based on importance	-Limited to a few Indian firms and done before 2014 (needs an update). -KM method related factors are not considered
Ruel, Shaaban and Ducros, (2019)	Lack of use of collaborative tools and the difficulty in calculating the return on investment of a KMS due to priorities for other programs are suggested as barriers	Not fully focused on barriers but proposes two factors
Zerbino <i>et al.</i> , (2018)	-Singled out 75 barriers to KM adoption and/or development in Port Community Systems (PCSs)-enabled ports -Classified to 6 groups (strategic, organizational, technological, cultural, individual, knowledge characteristics) -Ranked the Strategic, Organizational, and Technological classes as most important	-Study is specific to port system in maritime logistics and barriers were ranked with FGD, single port area was considered. - Limited empirical study, limited applicability to other business sectors

### 3.2.2 Identification and re-categorization of KM barriers

Apart from the lack of a comprehensive or whole set of barriers, the categorizations made in the previous studies have its own limitation. First and foremost, these are generic classifications where the specificity to KM field is unclear. For instance, in the main studies of barriers, Patil and Kant, (2014a, 2014b) and Zerbino *et al.*, (2018), all used generic category names: strategic, organizational, technological, cultural, and individual barriers. Moreover, these studies did not consider barriers related to the adoption and use of explicitly defined KM methods or techniques (such as: knowledge café, community of practices, etc) which are, instead, among the main ingredients of KM programs used to manage knowledge development (Cerchione and Esposito, 2017); thus, investigating the associated barriers to the adoption of these methods is necessary. For these reasons, there is an evident need to re-categorize the barriers to KM in SCs.

A new categorization of KM barriers in SCs, in line with a recently proposed classification of KM practices (Kassaneh, Bolisani and Cegarra-Navarro, 2021), is therefore proposed here. The assumption is that it will be easy for firms to manage in parallel both the adoption of some KM practice and its associated barriers. According to the mentioned classification, KM practices are conceptualized with a triple-part classification, namely: KM methods, KM applications of IT, and KM-enabling management measures. In line with this, we proposed a taxonomy of KM barriers into these three categories (figure 4), namely: barriers related to KM methods, barriers related to KM applications of IT, and barriers related to KM-enabling management measures. This categorization has two important points. Firstly, firms can easily trace and develop a specific mechanism to alleviate the barriers related to the implementation of a specific category of practices. Secondly, this category considers the possible barriers related to the KM methods/techniques which have a direct impact on the introduction and development of a KM program in firms' SC. It will also contribute to research in the area because it proposes a common notion of KM practices and associated barriers.

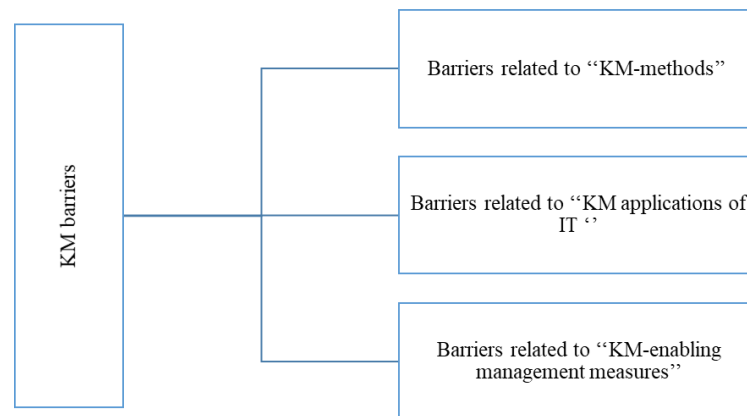

Figure 4. Categorization of KM barriers

When we say barriers related to the “KM methods”, this refers to factors that hinder the adoption of KM practices that are explicitly and directly targeted to the management of knowledge resources in a company, such as: barriers affecting the implementations of approaches to learning and exchanging knowledge contents; practical or mental toolboxes for favoring the systematization and access to knowledge resources; organizational arrangements which can be

employed to facilitate knowledge sharing among people, etc. For instance, “lack of intangible mechanisms like unscheduled meetings, informal seminars, coffee break conversations”, “lack of use of recent and user-friendly knowledge creation and sharing methods”, etc., are examples of barriers under this category.

Barriers related to the “KM applications of IT” refer to the factors hindering the use of IT systems that can support the management of knowledge contents in some form – for example, explicit knowledge in the case of database repositories and automatic analysis, or tacit knowledge in the case of communication-enabling systems. Lack of technical support on IT based systems to SC partners, lack of trust in system’s security, and lack of use of recent and user-friendly knowledge storage/retrieval and sharing technologies are examples of barriers related to this category. In the third category, the barriers related to the “KM-enabling management measures” are factors hindering the implementation of the purposeful KM-related managerial activities that may not directly refer to the management of knowledge but, anyway, can help to set the appropriate organizational context that facilitates the application of KM - for example, appointing KM officers, rewarding KM initiatives, providing leadership and top management support to KM programs, etc. Barriers under this category includes insufficient linkage between KM and corporate strategy, lack of commitment and support from top management, and lack of willingness and sharing spirit among SC members.

Accordingly, based on the analysis of the literature and its current gaps, this study singled out a provisional list of 61 possible barriers and they are classified into the above mentioned three main categories. After a cross-analysis and revision of these lists, to eliminate substantial replications and to highlight the focus on SCs (which is the main topic of this paper), there is a total number of 51 barriers of which 7 barriers are related to KM methods, 10 barriers are related to KM applications of IT, and 34 barriers are related to KM-enabling management measures. Further categorization was found important for the barriers classified under the third category. As this category is broad in nature and for the ease of management by firms, we made four sub-categories namely: strategy related (10 barriers), organization related (9 barriers), culture related (5 barriers) and individual or human resource related (10 barriers) (as used by Patil and Kant, (2014a, 2014b)). The detailed results which show the complete list of potential barriers along with their categories and sub-categories, and the references supporting their application to KM in SC, are presented in tables 2, 3 and 4.

Based on the literature review, the top five most frequently cited barriers to KM in SCs includes “lack of proper organizational structure that foster KM activities”, “KM not integrated with existing SC business processes”, “Time and resource constraints to provide adequate knowledge sharing opportunities to employees”, “competition or rivalry side of the “co-opetition” relationship - due to the sharer’s concern of knowledge leakage”, and “lack of support and commitment from the top management to work in collaboration with SC members”.

Our finding is more or less similar to the findings of Patil and Kant, (2014a, 2014b) and Zerbino *et al.*, (2018) where they are, however, included into the same category, namely “barriers related to the KM-enabling management measures (strategic and organizational related)”. This is due to the fact that most literature focuses on barriers related to management measures, i.e. it is assumed that a successful adoption of KM generically requires that strategic and organizational barriers need to be overcome. In addition, it shows that the other categories, specifically the barriers related to explicit KM methods and those related to KM applications of IT, are not well considered by the authors in most of the studies. This gives the opportunity for fresh empirical research.

Table 2. Barriers related to the “KM Methods”.

Category	Factors (barriers)	Reference
Barriers related to KM methods	Transmission, formalization and exchange of knowledge/information methods are currently not very effective, which creates several problems	Ruel, Shaaban and Ducros, (2019)
	Lack of use of collaborative mechanisms or tools between SC members	Ruel, Shaaban and Ducros, (2019)
	Lack of intangible mechanisms like unscheduled meetings, informal seminars, coffee break conversations	Riege, (2005); He, Qiao and Wei, (2009); Hutzschenreuter and Horstkotte, (2010)
	Insufficient support in capturing, evaluating and communicating lessons from past mistakes for fostering a learning effect	Riege, (2005); Cerchione, Esposito and Spadaro, (2015)
	Knowledge retrieval mechanisms that are hard to remember and do not avoid information overload	Alavi and Leidner, (2001)
	Difficulty to find a systematic method to acquire knowledge and use when applicable	Batista <i>et al.</i> , (2019)
	Lack of use of recent and user-friendly knowledge creation and sharing methods	Cerchione, Esposito and Spadaro, (2015); Cerchione and Esposito, (2017)

Table 3. Barriers related to the “KM applications of IT”.

Category	Factors (barriers)	Reference
Barriers related to KM applications of IT	Lack of technological infrastructure to adopt KM	Wong and Wong, (2011)
	Inhibition effect on learning due to KM systems	Zerbino <i>et al.</i> , (2018)
	Failure to develop a transactive memory system	Rosen, Furst and Blackburn, (2007)
	Lack of familiarity and experience with the new IT tools	Riege, (2005); Zerbino <i>et al.</i> , (2018)
	Lack of regular training concerning the new interactive KM IT based tools	Riege, (2005); Zerbino <i>et al.</i> , (2018)
	Lack of integration between IS/IT and business processes	Zerbino <i>et al.</i> , (2018); Riege, (2005)
	Lack of compatibility among different IS/IT tools	Zerbino <i>et al.</i> , (2018)
	Lack of trust in system’s security	Gunasekaran and Ngai, (2004) ; Zerbino <i>et al.</i> , (2018)
	Lack of technical support to SC partners	Hutzschenreuter and Horstkotte, (2010); Riege, (2005);
	Lack of use of recent and user-friendly knowledge storage/retrieval and sharing technologies	Cerchione, Esposito and Spadaro, (2015); Cerchione and Esposito, (2017)

Table 4. Barriers related to the “KM-enabling management measures”.

Category & sub-categories	Factors (barriers)	Reference
KM supportive management measures - strategy related barriers	Insufficient linkage between KM and corporate strategy	Blumenberg, Wagner and Beimborn, (2009); Zerbino <i>et al.</i> , (2018)
	KM not integrated with existing SC business processes	Zhao, de Pablos and Qi, (2012); Patil and Kant, (2014a, 2014b); Cerchione, Esposito and Spadaro, (2015); Ahmad and Daghfous, (2010); Nätti and Ojasalo, (2008);
	Lack of clear understanding of KM in SC	Shih <i>et al.</i> , (2012); Patil and Kant, (2014a, 2014b); Aziz and Sparrow, (2011)
	Lack of support & commitment from the top management to work in collaboration with SC partners	Patil and Kant, (2014a, 2014b); Cerchione, Esposito and Spadaro, (2015); Bandyopadhyay and Pathak, (2007)
	Legal issues (IP and related protection laws that hinder access and share among SC members)	Bagheri, Kusters and Trienekens, (2019); Cerchione, Esposito and Spadaro, (2015); Zerbino <i>et al.</i> , (2018)
	Lack of fund for KM system development	Ahmad and Daghfous, (2010); Zhao, de Pablos and Qi, (2012); Patil and Kant, (2014a, 2014b)
	Lack of a KM measurement framework	Batista <i>et al.</i> , (2019)
	Competition or rivalry side of the "co-	Batista <i>et al.</i> , (2019); Li and Kang, (2019); Kovács

	opetition" relationship, due to the sharer's concern of knowledge leakage	and Spens, (2010); Cheng, Yeh and Tu, (2008)
	Difficulty in calculating the return on investment of a KMS due to priorities for other programs	Ruel, Shaaban and Ducros, (2019)
	Lack of roles and responsibilities of SC members on KM programs	Nätti and Ojasalo, (2008); Patil and Kant, (2014a, 2014b)
KM supportive management measures - <i>organization related barriers</i>	Lack of rewards or recognition for contributing and sharing insights	Riege, (2005); Rosen, Furst and Blackburn, (2007); Zerbino <i>et al.</i> , (2018); Hutzschenreuter and Horstkotte, (2010);
	Lack of balance of the knowledge flow between the provider (source) and the knowledge seeker	Alavi and Leidner, (2001); Riege, (2005); Zerbino <i>et al.</i> , (2018)
	Communication and knowledge flows are restricted into certain directions of SC	Shih <i>et al.</i> , (2012); Patil and Kant, (2014a, 2014b); Zerbino <i>et al.</i> , (2018)
	Lack of proper organizational structure that foster KM activities	Riege, (2005); Ahmad and Daghfous, (2010); Nätti and Ojasalo, (2008); Alavi and Leidner, (2001); Patil and Kant, (2014a, 2014b)
	Limitation on KM leadership and managerial skills	Bandyopadhyay and Pathak, (2007); Batista <i>et al.</i> , (2019); Bagheri, Kusters and Trienekens, (2019)
	Low priority in knowledge retention of highly skilled/experienced staff	Fletcher and Polychronakis, (2007) ; Zerbino <i>et al.</i> , (2018)
	Insufficient education and training programs	Blumenberg, Wagner and Beimborn, (2009)
	Lack of adequate knowledge of functioning of other SC members	Nätti and Ojasalo, (2008); Aziz and Sparrow, (2011)
	Time and resource constraints to provide adequate knowledge sharing opportunities to employees	Ahmad and Daghfous, (2010); Zhao, de Pablos and Qi, (2012); Bagheri, Kusters and Trienekens, (2019); Aziz and Sparrow, (2011)
KM supportive management measures - <i>culture related barriers</i>	Lack of a shared cultural meaning of KM activities	Beesley and Cooper, (2008); Bagheri, Kusters and Trienekens, (2019)
	Lack of an organizational culture/norm that fosters knowledge sharing	Riege, (2005); Nätti and Ojasalo, (2008); Hutzschenreuter and Horstkotte, (2010); Shih <i>et al.</i> , (2012)
	Lack of trust and commitment among SC members	Bagheri, Kusters and Trienekens, (2019); (Samuel <i>et al.</i> , 2011); Shih <i>et al.</i> , (2012)
	Insufficient common understanding	Bagheri, Kusters and Trienekens, (2019)
	Lack of willingness and sharing spirit among SC members	Hutzschenreuter and Horstkotte, (2010); Patil and Kant, (2014a, 2014b)
KM supportive management measures - <i>HR/person</i>	Lack of time or opportunity to share and to apply knowledge	Davenport and Prusak, (1998); Aziz and Sparrow, (2011)
	Lack of willingness to share knowledge	Bagheri, Kusters and Trienekens, (2019); Zerbino <i>et al.</i> , (2018); Patil and Kant, (2014a, 2014b)

<i>related barriers</i>	Fear of publishing something confidential	Paroutis and Saleh, (2009); Zerbino <i>et al.</i> , (2018)
	Fear of losing knowledge and IP ownership	Patil and Kant, (2014a, 2014b); Bagheri, Kusters and Trienekens, (2019);
	Unawareness of what knowledge has to be shared and how to systematically share it.	Patil and Kant, (2014a, 2014b); Batista <i>et al.</i> , (2019)
	Lack of trust in people	He, Qiao and Wei, (2009); Riege, (2005); Rosen, Furst and Blackburn, (2007);
	Lack of absorptive capability	Zerbino <i>et al.</i> , (2018); Patil and Kant, (2014a, 2014b)
	Differences in experience, age, gender, and education levels	Riege, (2005); Zerbino <i>et al.</i> , (2018)
	Fear to share incorrect information	Pillai and Min, (2010); Zerbino <i>et al.</i> , (2018)
	Technophobia	Lin, Wu and Yen, (2012); Zerbino <i>et al.</i> , (2018)

#### 4 Summary and comparison to previous literature reviews

As mentioned, there are some previous reviews that treated a similar topic, and particularly three papers (Bhosale and Kant, 2016; Cerchione and Esposito, 2016; Pérez-Salazar *et al.*, 2019) on KM in SC in general, and three specific studies on barriers affecting KM in SCs (Patil and Kant, 2014a, 2014b; Zerbino *et al.*, 2018). In this section, a summary and comparison of these studies is proposed to highlight their contribution, to show their limitations, and to provide useful comparisons. Also, the SLR proposed in this paper differs from the previous studies because it clarifies and extends their results especially by adding these points:

- A classification of papers by “factors”, i.e., enablers or barriers, to know which one is covered or not covered.
- A classification of papers by “unit of analysis”, i.e., firm level, SC level and supply network level
- A re-classification of the barriers related to each specific category of KM practice (the previous studies just proposed generic taxonomies of barriers with no direct connection with specific KM practices)
- An addition of further barriers related to explicit KM-methods or techniques, which have not been considered before but have a significant impact on KM introduction and development.

In addition, this review is “topic-specific” because it focuses on KM barriers that affect the management of knowledge resources and processes of firms with their SC partners.

## **5 Conclusion and future directions**

The analysis of selected papers in the last 20 years shows an increasing trend, especially in the last decades, which implies the importance of studying KM in a SC perspective. Indeed, competition is nowadays more among SCs than between individual firms. In spite of its importance, the implementation of KM in SCs can encounter several barriers, which must be investigated and presented in a complete way. This can help both research and practice on this topic.

The available studies on KM barriers in SCs already provide useful insights but fail to provide a consistent and complete classification of barriers which considers all the typologies, and thus a unified vision or perspective on this topic has not emerged so far. Thus, this paper makes three scientific contributions. First, it provides an up-to-date in-depth systematic review of barriers to KM in SCs. Second, it makes a first attempt to provide a systematic identification and re-classification of KM barriers in consistent categories that are relevant to KM implementation. Third, in the previous studies, the explicit KM methods and the related barriers have not been investigated, and this study tries to include them in the analysis to provide a comprehensive list of barriers.

As for a practical implication, the complete list and categorization of KM barriers can be significant for managers and KM consultants in their effort to introduce and adopt various KM practices in SC management. Our categorization can help company executives to identify and manage these barriers because they are clearly associated with each specific category of KM practice. Indeed, as mentioned, competition is more and more among SCs and networks of firms rather than single companies, so managers must know and overcome the potential barriers to successfully manage knowledge at the level of SCs.

Understanding these hindering factors is an important prerequisite for the competency development of both management and staff for a successful implementation of KM programs in SCs. However, the proposed categorization of KM barriers needs a further empirical validation for assessing the applicability and relevance, streamline the number of barriers and identifying if other new barriers are being faced by firms. It is also important to rank the barriers based on an

empirical evidence to identify the most influential barriers and help organizations to concentrate on these barriers and develop KM based strategies to tackle them on priority and achieve competitive advantage. This can be the object of future research.

## Abstract

Our study arose from a need to discover new knowledge about two types of language units: German modal verbs and medical terms of disease descriptions. The paper focuses on creating and enriching knowledge bases of language units' meanings and their definitions and designing information technology providing the discovery of new knowledge. The discovery is based on a model named information technology-oriented (hereafter – ITO model), and its particular case called the filling model. There are three main differences between these two models and the spiral model. First, the ITO and filling models distinguish between two explicit knowledge representations: by words and computer codes. Second, the models include four additional transition processes: visualisation (computer codes → words), digitalisation (words → computer codes), conceptualisation, and annotating apart from processes already present in the spiral model of knowledge creation. Thirdly, they serve as a theoretical basis for developing information technology of goal-oriented discovery of new knowledge in large digital collections. The models combine the automatic and expert stages of enriching knowledge bases in the paradigm of human-computer symbiosis. The paper aims to consider the filling and ITO models. The latter is positioned as the digital transformation outcome of the spiral model of knowledge creation.

**Keywords** – Goal-oriented knowledge discovery, Knowledge base, Filling model, Human-computer symbiosis, ITO model.

**Paper type** – Academic Research Paper

## 1 Introduction

There is a large corpus of literature investigating the impact of artificial intelligence (AI) on the definition and solution of problems related to knowledge management (KM). The literature review by A. Zbucha et al. (2019) provides a

multi-faceted analysis of relationships between AI and KM. Since 2012, the International Workshop on Artificial Intelligence for Knowledge Management has been held eight times. Relations between AI and KM are reflected in the name of the workshop. Its objective "is to gather both researchers and practitioners to discuss methodological, technical and organisational aspects of AI used for knowledge management" (Mercier-Laurent, et al., 2021).

In 2021, the workshop highlighted the relevance of using human-AI systems for knowledge management (Mercier-Laurent, 2021; Monsone, 2021). According to Mercier-Laurent (2021), "The balance between the use of technology and human capacity should be preserved. <...> We have to design applications able to enhance human intelligence without switching it off". Together, human and artificial intelligence would help not only to enhance the usability of current AI systems (Blasch, et al., 2019) but also deal with those KM problems that cannot be solved without human-computer symbiosis or its special case named human-AI one (Licklider, 1960; Jarrahi, 2018; Trunk, et al., 2020; Stephanidis, et al., 2021; Elgendy, et al., 2021). We have developed the filling and ITO models for solving one of such KM problems: discovering new language units' meanings based on human-computer symbiosis combining the automatic and expert stages of enriching knowledge bases.

Note that Licklider formulated the concept of symbiosis between human and computer over 60 years ago. In 1960, he created a concept named Man-Computer Symbiosis (Licklider, 1960). According to Abbass, Licklider "used the word 'man' since at that time it meant 'males and females', whereas, since the 1970s, it has been used to refer to 'males' alone and has been replaced with the gender-neutral word 'human'. Licklider predicted that by 1980, AI will have the ability to think and solve problems and that by 1985, humans and AI machines will coexist, working in harmony together. <...> The evolution of AI has not matched Licklider's vision. The year 1980 did not record any serious implementation of AI that could compete with humans. The year 1985 did not witness human-computer symbiosis. The year 1993 only saw an AI winter. Nevertheless, hope started to rise again with the IBM Deep Blue program winning against Kasparov in 1997" (Abbass, 2020).

The paper aims to correlate the developed ITO model with the spiral model of knowledge creation (Nonaka, 1991; Nonaka and Takeuchi, 1995). The ITO model generalises the filling model (Zatsman, 2020) described in the following section. In section 3, prerequisites for creating the ITO model are characterised. In section

4, the ITO model is considered as the digital transformation outcome of the spiral model.

## 2 Filling model

The model arose from a need to find and fill in lacunas in a knowledge base supporting translation research, which influenced the choice of the name for it. The filling model describes the processes of enriching the knowledge base about studied language units. The enrichment is based on conceptualising potential sources of new meanings of language units. In our linguistic projects, the potential sources are parallel text sentences (Tabl. 1). The conceptualisation (=concept creation) provides an opportunity to discover new meanings of language units in texts in a goal-oriented way and represent the meanings by headings of the knowledge base and their definitions.

Table 1. Sentence-aligned German-Russian parallel texts

<b><i>German sentence</i></b>	<b><i>Russian translation</i></b>
Don Quijotes sollen wir wohl alle sein, wenn wir nur ein wenig das Herz auf dem rechten Fleck haben und ein Körnchen Verstand unter der Schädeldecke.	Мы все Дон-Кихоты, если у нас честное сердце и под черепной коробкой крупица разума.
Ich glaube an die Gerechtigkeit und an die Menschheit, der diese Gerechtigkeit dienen soll.	Я верю в справедливость и в человечество, которому должна служить эта справедливость.
<i>[Friedrich Dürrenmatt. Der Verdacht (1953)]</i>	<i>[Translated into Russian by N. Savinkov (1990)]</i>

The initial conditions of the development of the filling model were obtained in observing translation research of linguists. They analyse and annotate studied language units along with their contexts and translations and simultaneously enrich the knowledge base by new headings and their definitions if new meanings of studied units in parallel text sentences are discovered. Linguists discover new meanings and represent them by entirely new headings of the knowledge base or change existing ones. At the same time, they create the definition of the new heading or change the existing definition.

Let's summarise the initial conditions for creating the filling model, obtained as a result of observing the work of linguists:

1. The discovery of new knowledge about studied units is a goal-oriented iterative process
2. Linguists analyse and annotate contexts and translations of studied units to discover new meanings and represent them by updated or new headings
3. Obtained annotations, including contexts and relevant headings, are stored in a database
4. New headings created by linguists are added to the knowledge base

Any heading added to the knowledge base represents a new concept of only one linguist; this concept and a relevant heading are individual. In the general case, different linguists may generate unlike individual concepts and relevant headings created during the conceptualisation of the same context. A group heading concept is formed in the process of discussing individual headings and their definitions by the group of linguists who enrich the knowledge base. The purpose of the discussion is to create a consensual definition for a heading concept within the group. The group concept has to cover the new consensual meaning of a studied language unit discovered in parallel text sentences. Therefore, the proposed filling model should describe two procedures of enriching the knowledge base, namely:

- Discovering and representing new individual meanings of language units by headings and their definitions
- Creating and representing consensual definitions for heading concepts within the group of linguists

The proposed filling model is based on the four following ideas. First, in addition to internalisation, socialisation, and externalisation as transformation processes of the spiral model (Nonaka, 1991; Nonaka and Takeuchi, 1995), the filling model includes four processes: *visualisation* (computer codes → words), *digitalisation* (words → computer codes), *conceptualisation* (texts → concepts), and *annotating* (concept contexts → annotations), but without using the process of combination. Second, the model covers three media of different nature: mental, informational, and digital (Zatsman and Buntman, 2015). Third, transformation processes of visualisation and digitalisation are anchored to the boundary between informational and digital media (Fig. 1). And finally, the process of conceptualisation covers mental and informational media and the

boundary between them. To simplify Fig. 1, the process of conceptualisation is depicted in the informational medium only and annotations are shown without processes of annotating concept contexts.

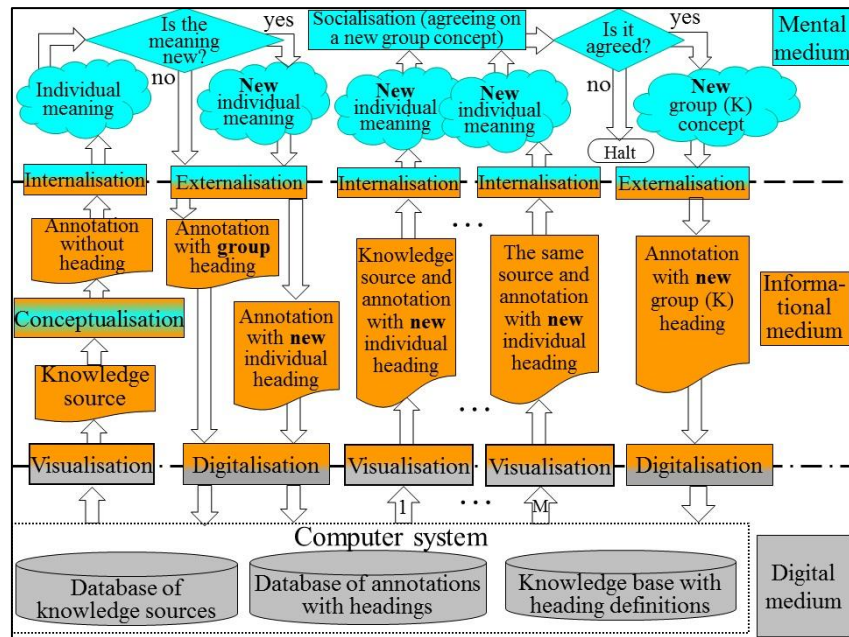

Figure 1. The filling model

Now we give a brief depiction of all the seven processes of the filling model, which consists of two submodels. The first submodel describes the iterative work of one linguist discovering new individual meanings of language units and annotating their contexts (see the left part of Fig. 1; the process of annotating is not shown in Fig. 1). Each iteration includes the following steps:

- The first pair of parallel text sentences with a studied language unit and its context is extracted from the database of knowledge sources and converted into its perceptual form (designated as "Visualisation")
- A linguist semantically analyses the extracted pair and tries to discover and describe the meaning of the language unit within its context ("Conceptualisation")
- If the linguist cannot recognise the meaning of the language unit in question, then the iteration of processing the first pair stops (it is not shown in Fig. 1), and the linguist begins the next iteration

- If the linguist recognises the meaning, then he or she represents it in the form of an annotation without any knowledge base heading ("Annotation without heading")
- The annotation without heading is semantically analysed to internalise the meaning represented ("Internalisation")
- The linguist compares his or her meaning with *group* heading concepts represented in the knowledge base ("Is the meaning new?")
- If the meaning is new ("yes"), then the linguist creates a new individual heading and its definition in the knowledge base, the concept of which would cover the meaning, and adds the heading to the annotation ("Externalisation"), which is recorded in the annotation database ("Digitalisation")
- If the meaning isn't new ("no"), then the linguist adds the relevant *group* heading of the knowledge base to the annotation ("Externalisation"), which is recorded in the annotation database ("Digitalisation")
- After digitalisation, the linguist begins the next iteration

The linguist performs the listed steps for each potential knowledge source found. If these processes were repeated M times for the same source by M different linguists, then up to M different annotations with individual headings can be formed.

The second submodel describes the work of M linguists to create a single consensual heading (see the right part of Fig. 1) based on the same knowledge source and M different annotations. The creation process includes the following steps:

- M annotations with new individual headings created by M different linguists are retrieved from the database of annotations and converted into perceptual forms together with the pair of parallel text sentences as their source of discovered new knowledge ("Visualisation")
- M annotations are semantically analysed to internalise the meanings represented ("Internalisation")
- M linguists try to create a single consensual heading, the concept of which would align M meanings of a studied language unit described by M linguists ("Socialisation")

- If linguists cannot create any consensual concept of a heading ("no"), the socialisation process stops for these M individual headings (see the terminal «Halt» in Fig. 1)
- If the single consensual concept of a heading is generated by K from M linguists ( $1 < K \leq M$ ), then the socialisation process is completed by creating the definition of the heading whose socialisation index equals K ("yes")
- Linguists create a new annotation with the heading ("Externalisation")
- They add the heading with its definition to the knowledge base, and the annotation is recorded in the annotation database ("Digitalisation")
- Then the listed processes of the second submodel are performed for series of individual headings formed for other knowledge sources.

There are four main differences between the filling model and the spiral model. First, the filling model distinguishes between two representation modes of explicit knowledge (by words and computer codes). Second, it includes four additional transition processes apart from three ones (internalisation, socialisation, and externalisation) already present in the spiral model. Third, the filling model covers the conceptualisation of sources of new meanings of language units (texts → concepts). And finally, it is a theoretical basis for designing computer algorithms and information technology for goal-oriented discovery of new knowledge about language units in digital text collections. See Fig. 1-3 with algorithms in (Zatsman, 2020) which is the basis for developing information technology.

Using the filling model, our team has developed a computer system that enriches the linguistic ontology about meanings of German modal verbs and their exemplary translations into Russian. A German-Russian dictionary that reflects the state-of-the-art level of knowledge about these studied language units was selected to apply the computer system. To show the feasibility of goal-oriented enrichment of the linguistic ontology, our team has designed a knowledge base with the initial version of the ontology created based on the dictionary by linguists.

The database of potential knowledge sources has been loaded with parallel texts of several hundred books. The downloaded texts of the books have been aligned so that one original sentence corresponds to its translation. Sometimes several sentences of the original text were put in correspondence with their translation, which may include one or more sentences. Thus, downloaded texts are divided into potential sources of new knowledge, as shown in the example of

the two pairs in Tabl. 1. For all books downloaded to the database, 535140 pairs as potential knowledge sources have been formed computerised.

Translations of German modal verbs are the subject of the study. They include the verbs dürfen, können, mögen, müssen, sollen and wollen. Out of 535140 pairs, 109130 contain these verbs, and in 14155 of them, the verb sollen is used. Tabl. 1 shows two examples of potential sources from 14155 pairs that contain the verb. Up to May 5, 2021, 5366 out of 109130 pairs containing these six verbs had been analysed by linguists. Eight new meanings of verbs were discovered during the analysis, and their definitions were agreed amid five linguists. The definitions of eight group concepts with their headings were added to the knowledge base.

If the filling model is compared to the list of the four above-mentioned initial conditions for its creation, it will be noticed that the second condition is only partially reflected in the model. Namely, linguists discover new meanings and represent them by entirely new headings of the knowledge base or changed existing ones. In the filling model, new meanings are only being represented by *entirely new headings*. To eliminate this drawback, a generalisation of the filling model was proposed, presented in section 4 in juxtaposition with the spiral model.

### **3 Prerequisites for creating the ITO model**

Besides eliminating the noted drawback, the ITO model as a generalisation of the filling model arose from a need to discover new knowledge for creating and updating a medical knowledge base (KB) of terminological profiles of diseases. If in the linguistic knowledge base about modal verbs, the number of modal verbs was known in advance (six verbs) and only the number of meanings of each verb could change, in the medical KB, both the number of profile's terms and the number of meanings of each new or existing term can change. Our medical KB comprises the terminological profile for only one disease (breast cancer).

The proposed ITO model is a design base of information technology enriching the medical KB using machine learning. Let's consider resources and prerequisites for creating the model. To enrich the medical KB, we use the outcomes of processing a large collection of medical documents. Our project uses the PubMed Central (PMC) database as a digital collection containing more than 6 million full-text records on biomedical and life science literature (PMC, 2021).

The principal prerequisite for creating the ITO model is that the growth of scientific knowledge represented in medical texts sometimes results in new terms which need to be regularly annotated and added to the medical KB. The annotation of each term contains: 1) a structured definition of each meaning of the term, 2) the retrospective of each definition variants, 3) its subsumption relations, meronymy and other relations, 4) term contexts extracted from full-text records, 5) a linkage between each context and its record, 6) term synonyms, 7) term associations with disease stages.

A term with its contexts discovered during the automatic processing of full-text records describing a disease can belong to one of five groups of terms formed according to the following criteria:

- 1) terms are not related to the disease in question or are common to several diseases (irrelevant to our project);
- 2) term contexts indicate a new *synonym* for one of the existing terms of the medical KB;
- 3) extracted contexts of an existing term indicate the need to renew the *definition* of its some concept in the medical KB;
- 4) extracted contexts of an existing term indicate the need to add a *new concept* of medical knowledge and its *definition* to the existing term annotation of the medical KB;
- 5) a discovered term is new, and its contexts express the *new concept* of medical knowledge (a new *annotation* of the term should be entered into the medical KB)

The whole cycle of processing full-text records describing the disease in question includes five stages:

- 1) the formation of an array of records that describe the disease;
- 2) automatic discovery of terms and their contexts in scientific texts, which can update the medical KB;
- 3) computer-based generation of the five listed groups of terms based on machine learning of the classification of terms;
- 4) expert analysis of each group of terms and clarification of the composition of each group;
- 5) expert enrichment of the medical KB by new synonyms, updated definitions, new definitions or annotations of new terms according to the proposed ITO model.

The first three stages are designed to automatically process full-text records and narrow the range of potential sources of new knowledge. A significant range narrowing is necessary at the first three stages so that the experts can execute the last two stages in an acceptable timeframe. In this case, the symbiosis of human and artificial intelligence allows updating the medical KB according to the ITO model.

#### **4 ITO model**

The filling model, as the particular case of the ITO model, describes one kind of representation of discovered meaning by its definition. The ITO model has to describe any number of kinds of representation. For example, the ITO model should describe enrichment of the medical KB by four kinds of representation of discovered knowledge: a new synonym, an updated definition, a new definition or the annotation of a new term.

The creation of the ITO model is implemented as the digital transformation of the spiral model (Nonaka, 1991; Nonaka and Takeuchi, 1995) based on seven principal pillars:

- the model should not depend on the number of kinds of representation of the discovered knowledge
- four processes of the filling model (visualisation, digitalisation, conceptualisation, annotating) and four processes of the spiral model (internalisation, socialisation, externalisation, combination) should be integrated by the model
- eight processes take place in three media (mental, informational, digital) and/or on their boundaries
- the processes of visualisation and digitalisation are anchored to the boundary between informational and digital media
- the process of conceptualisation takes place in the mental and informational media and on their boundary (the process is depicted in the informational medium only)
- there is a digital collection of texts which is relevant to the goal of new knowledge discovery from the texts
- in the digital medium, there is a knowledge base for representing new knowledge, e.g., the linguistic knowledge base or medical KB

In the first stage of the digital transformation of the spiral model, we will consider only the mental and informational media. The four types of knowledge of the spiral model are distributed among these two media: tacit knowledge is in the mental medium, and explicit knowledge is in the informational medium. Socialisation takes place in the mental medium. Externalisation and internalisation correspond to the boundary between the mental and information media, and the combination takes place in the informational medium (Fig. 2).

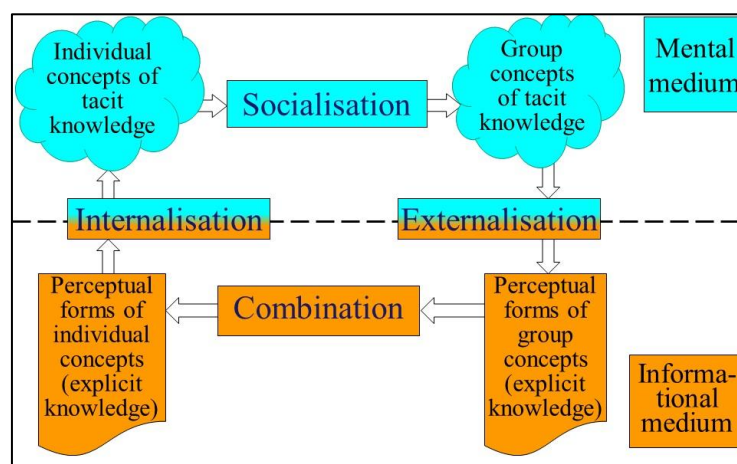

Figure 2. The mental and informational media of knowledge generation

The source of new concepts is a large collection containing digital texts. The collection is stored in the digital medium added to the mental and informational media (Fig. 3). Adding the digital medium is the second stage of the digital transformation of the spiral model. The collection of texts is a source of new knowledge in the digital medium. However, in Fig. 3, this source is not yet integrated with the process of discovering new knowledge. To integrate it, we need to use three more processes (conceptualisation, annotating, and digitalisation) added at the final stage of digital transformation, completing the creation of the ITO model (Fig. 4).

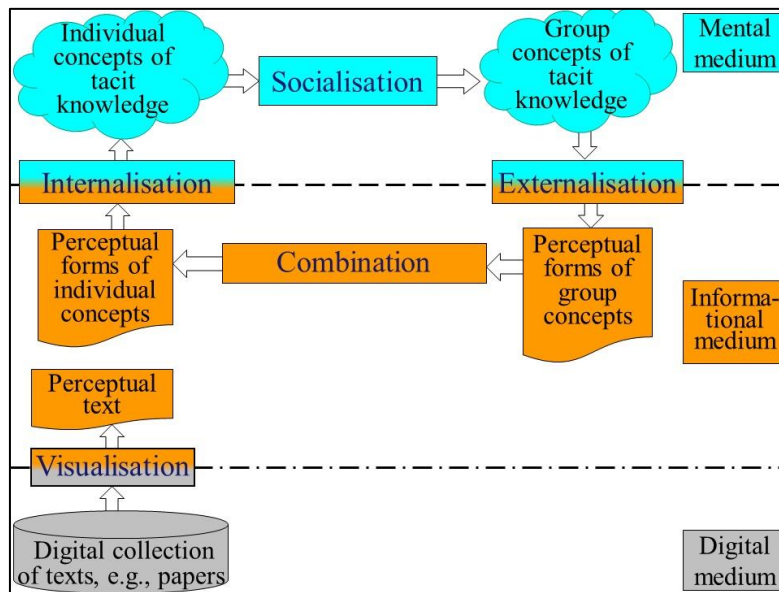

Figure 3. The mental, informational, and digital media

To perform a semantic analysis of a text potentially containing a new term, it is necessary to find the needful text in a digital collection and represent it in a perceptual form. The digital text's transformation into its perceptual form is denoted by the word "Visualisation" (Fig. 3&4). Questions about finding texts with new terms are not discussed here. The goal of the semantic analysis performed by an expert and indicated in Fig. 4 by the word "Conceptualisation" is to discover new knowledge from a text and represent it in a knowledge base.

After completing the semantic analysis process, the expert renews an existing annotation adding a new synonym, a new or updated definition, or creates the annotation of a new term in the knowledge base (see word "Annotating" in Fig. 4). This personal annotation is digitised and entered into the knowledge base.

To form the group concept, personal annotations are retrieved from the knowledge base and converted into their perceptual forms. Further, combination, internalisation, and externalisation processes correspond to the spiral model of knowledge generation with one significant difference: the perceptual form of a group concept is digitised and entered into the knowledge base. If there are several personal annotations formed by different experts based on the same context, they are retrieved from the knowledge base and converted into their perceptual forms.

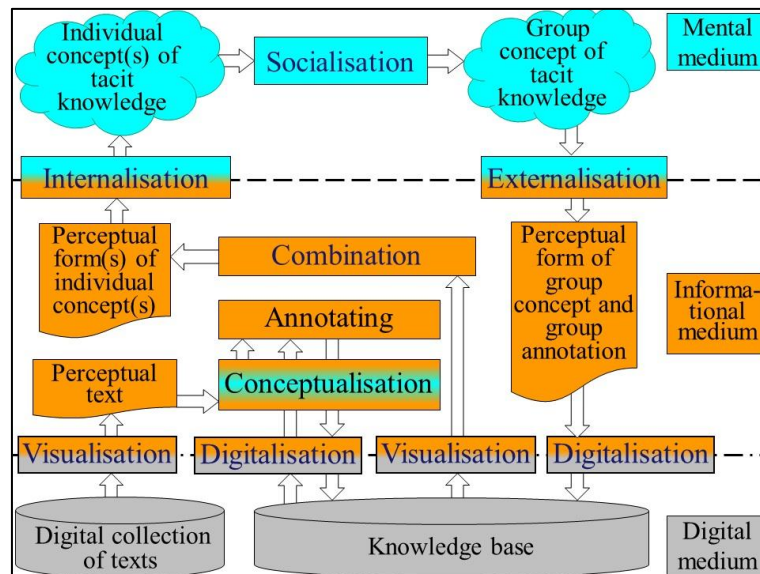

Figure 4. The ITO model

There are four main differences between the ITO model and the spiral model (Nonaka, 1991; Nonaka and Takeuchi, 1995). First, the ITO model distinguishes between two representations of explicit knowledge: by words and computer codes. Second, the model includes four additional processes: visualisation, digitalisation, conceptualisation, and annotating. Thirdly, the ITO model has the explicit standard of the novelty of discovered knowledge (it is not shown in Fig. 4). And finally, the model is a theoretical basis for developing information technology for goal-oriented discovering new knowledge in texts.

## 5 Conclusions

On the one hand, the ITO model is a generalisation of the filling model. On the other hand, it was obtained as an outcome of the digital transformation of the spiral model. To develop computer algorithms and information technology for discovering new knowledge based on the ITO model or the filling model, we should describe five items:

- studied language units, e.g., modal verbs or medical terms
- the goal of discovering new knowledge about them
- the large digital collection of texts which is relevant to the goal

- the standard of the novelty of discovered knowledge (a dictionary, thesaurus, and so on) that reflects the state-of-the-art level of knowledge about studied language units
- the number of kinds of representation of discovered knowledge

As noted above, for German modal verbs, the goal is to enrich the linguistic ontology of meanings of the verbs and their exemplary translations into Russian. The digital collection includes several hundred books with 109130 usages of modal verbs. A German-Russian dictionary that reflects the state-of-the-art level of knowledge about modal verbs was selected. The number of kinds of representation of discovered knowledge is one (only new definitions of modal verb meanings). After describing these five items, algorithms and information technology were designed based on the filling model for goal-oriented discovering new knowledge about meanings of modal verbs by linguists (Zatsman, 2020).

For medical terms of disease descriptions, the goal is to enrich the medical KB of terminological profiles of diseases. The digital collection is the PMC database which "contains more than 6 million full-text records, spanning several centuries of biomedical and life science research" (PMC, 2021). The National Cancer Institute Thesaurus (NCIt) reflected the state-of-the-art level of knowledge about medical terms was selected (NCIt, 2021). The number of kinds of representation of discovered knowledge is four (a new synonym, an updated definition, a definition of a new concept, the annotation of the new term). After completing the description of these five items, we are now designing algorithms and information technology based on the ITO model to discover new knowledge to enrich the terminological profile of breast cancer.

## **Acknowledgements**

The reported study was funded by RFBR (project number 20-012-00166) and RFBR and NSFC (project number 21-57-53018). I thank D. Bakhmatov, A. Goncharov, D. Dobrovol'skij, V. Karpov, V. Leonteva, A. Sharandin, A. Sukhneva, and Anna Zalizniak for analysing German modal verbs, A. Khakimova, and O. Zolotarev for designing information technology supporting the enrichment of the medical KB, A. Durnovo, M. Kruzhekov, and E. Loschilova for creating the linguistic knowledge base. I also thank A. Rychikhin for helpful comments and suggestions.

### Abstract

The faculty of Innovative Technologies of the University of Applied Science of Southern Switzerland (SUPSI), started in November 2020 a study for assessing the importance and the diffusion of a project management structure in the Swiss and north Italy small to large size companies.

The study has been based on a structured survey, written in Italian, sent to a huge pool of Switzerland and Italian companies and it aims to understand how the organizational structure has been affected by the pandemic time we are living and by the management knowledge relating to managing projects. More precisely, the following research study focuses to analyze the organizational structure into the different operational contexts of the inquired companies and therefore its correlation with the project management maturity and the most relevant factors responsible for the project's success or failure during this uncertain time.

The research will provide objectives and results showing which is the common organizational structure related to a working context and its relations with management knowledge and project' success achievement, clarifying how companies have been affected by the global pandemic situation in terms of managing projects.

**Keywords** – Project Organizations, Project Success, Methodologies, Maturity, Uncertain Times

**Paper type** – Academic Research Paper

## **1 Introduction**

Every Organization adopts a different structure in which they are working, to achieve their goals according to their corporate objectives.

The well-defined organization structures in accordance with the business context make it possible to achieve the objectives, allocate the correct resources and influence the success of the projects and subsequently the success of the company.

The literature [1] shows how organizations can apply different organizational project structures and how these affect the benefits or disadvantages compared one to another, this is regardless of the context in which the company operates.

In fact, it is not the activity which is carried out by the company that defines the type of structure chosen, but it is the result or product which influences the choice of the Organizational Structure (OS).

The OS creates a reference framework that allows the interaction of all those who are involved in the project and which are necessary for the execution of the project. The support of the OS is responsible for a smooth progression and therefore to be as efficient as possible, this responds in a clear definition of roles, tasks, responsibilities and the allocation of the necessary skills.

Project organizational structures are distinguished by their ability to determine the availability of resources and influence how projects are managed and conducted.

The main forms of OS are:

- Functional organizations
- Dedicated functional organization
- Organization for projects
- Matrix Organization (weak/balanced/strong)
- Project Management Office (PMO)

### **1.1 OS theory vs. reality**

The Organizational Structure (OS) is the major factor that plays a fundamental role in guiding and defining the ways in which the organization carries out its operation, in the same way they are responsible for determining the hierarchy of people, their function, the workflow and the reporting system. In relation to the different sectors in which they operate the organizations shape their structures to

optimize their results to obtain the needed resources and to optimize it for the marked demand.

### ***1.2 OS and the success of the project***

The failure of a project often occurs in the absence or unclear organizational structure. With time passing, technological innovation and the market demand for increased specific skills, organizations are meeting often new challenges like new, unusual and limited in time. Furthermore, the current pandemic situation creates new challenges to which companies must adapt relatively quickly. In this scenario the classic organization is unable to cope with this kind of commitment: here a specific organization and/or strategy is required for the project management.

### ***1.3 Training and knowledge management***

With the advancement of technologies, the markets in the various fields of application are confronted with a sudden change and with increasingly specific and ambitious requests. It follows that the organizations have to keep up with the times, the organizations are in need to hire highly specialized professionals which bring the know-how and are able to handle the required tools and methodologies which are currently available and who have the flexibility to adapt to changes.

The type of OS applied within the company influences the role of the PM and the respective skills required, this can have a range from the simple coordinator/expediter (administrative PM) towards the real project manager with full decision making power.

Nowadays the resources that are sought by organizations are no longer limited to an in-depth knowledge of the subject, these so-called hard skills are well trained resources with a well developed behavioural and leadership skill. The so-called soft skills on the other hand are additional internal training courses, these are often held by specialized external organizations in the field of training. It is often necessary to introduce new training for a changing market demand, this creates a benefit for the company because it creates new professional figures, new tasks and a reorganization within the company structure.

## 2 Methodology

We decided to collect the necessary data for our study by sending an email survey to Italian companies located in Switzerland and northern Italy. It was sent to small, medium and large companies which are operating in different sectors on a national and international scale. To interview people out of different sectors has brought us many advantages, one of these is a wide view of different organizational structures.

Being in a situation of health and economic crisis because of the COVID-19 we took the opportunity to evaluate the effectiveness of the methodologies in this particular situation and if the trend of the same approach received any change.

To perform this survey we used the tool "Google form" and the survey consists of 21 questions, divided into 4 categories:

- 7 general questions, these are used to identify the type of company and their general idea of project management.
- 3 questions on how the projects are structured. These questions are used to identify how projects are managed within the organization.
- 8 questions on how the projects are managed, these questions allowed us to measure how far these organizations deviate from the OS in practice.
- 3 questions about the degree of success of internal projects. These questions are used to get an idea of the degree of success depending on the organizational strategy.

General identification	Project structure	Project management	Achieved results
In which environment operates the company?	Who manages the projects in your company?	What kind of organizational structure comes closest in your company?	How do you rate the success rate of the projects and are the results satisfying?
What's the size of your company	Does the Project Manager or Project representative have specific training for his role ?	On which standard is your project management methodology inspired by ?	If there are problems, which areas are most frequently touched?
On which scale of useability refers to the core business of	In your project management methodology, what	Are the projects part of a program or portfolio ?	In your opinion, what are the causes of possible failures?

your company?	level of decision making does the project manager / project representative have?		
Who is in charge of the project management organization?		Is there a central organization (PMO) in your company responsible for project management?	
Is there a common and clear strategy in your company?		In case of an existing PMO, what role does it cover?	
How many years has project management been introduced?		Does the organization ensure adequate allocation of human resources for ongoing projects, taking into consideration the qualitative and quantitative need of multiple projects?	
Indicatively, what percentage of the projects are covered within respect of the company operations (routine/daily business)		The project management methodology is always identical or varies according to the project (complexity, duration, sectors touched)	
		How often the company project procedures will be updated?	
7	3	8	3

Finally the results will be analyzed, interpreted and summarized in the following chapter.

### 3 Results

In this chapter we will describe the results obtained by considering the interaction between the survey questions according to the objectives set.

Referring to the general framework, the results show that among the companies surveyed, there is a majority of respondents from the building or construction sector in general, from the Public Administration and Services sector, as well as from sectors not properly defined by the list provided.

The vast majority of organizations that took part in the survey have a size of 1000 employees or more (large organizations), while most of the other have between 250 and 999 employees (medium organizations); the core business with the greatest influence is that which refers to an international scale of users (38%), but it can be seen that on a national scale also has a certain importance (32%).

With reference to project management, it is recorded that around 53,5% of the organizations have introduced this methodology over ten years ago, while around 30% have been doing so for less than five years.

From the data we also found that specific project management tools also follow this trend. In 40% of the companies where specific project management tools or tools adapted to the company's needs are used, project management has been introduced more than 10 years ago.

From an initial analysis, it can be seen that large companies, and those that are also looking at users outside the country, have had a project management methodology in place for years.

In relation to the work areas examined, it can be seen that the organizational structure that is most used is the Functional Project Organization.

This Project Organization is mostly used in the areas of Public Administration, Health and other activities not properly described in the list provided. In this way, it can be seen that a project-based organization is preferred in the construction industry.

As mentioned previously, the specific organizational structure mostly used by the interviewed company is the Functional, around 26% of the cases. This structure is organized by "silos" where decision making is referred to a functional manager. The other structure mostly used is the balanced matrix around 17%, where we can find an equal distribution of the decision making between the functional manager and the project manager. However, it should be noted that all matrix versions added together (weak/balanced/strong) we talk about 33% of the interviewed companies. As mentioned, the balanced matrix prevails just over 17% of the total, followed by the strong matrix (10.1%) and last but not least the strong matrix (5.5%) of the preferences.

It should be noted that in absolute terms almost one sixth of the companies (15.6%) use an organization for the projects and another 11.1% a functional

organization for the project. Almost 12.1% of the interviewed participants were unable to indicate what kind of organizational structure their company has. In large companies almost 23% are organized in a functional manner, although it can be noted that 22% are oriented toward a balanced matrix organizational structure. Smaller companies on the other hand prefer project based organizational structure in which the project manager has a wide range of competences and a high authority.

### ***3.1 Project Management Methodology***

In absolute terms the most used project management standards in the analyzed samples are

- Agile - 27.6%
- PMI - 25.1%

ICB/IPMA, Prince2 and Hermes all down below 10% each.

23% of the interviewed participants use a standard not mentioned in our questionnaire, as many as 26.1% of the participants told us that they do not use a standard of any sort for their project management.

In general, it is noticeable that companies that have been introducing a project management methodology for less than ten years do not rely on one of the recognized methodological standards. In particular, the tendency is to have a methodology in the early years that is close to Agile or PMI and then turn into a customized solution that can no longer be assimilated to a standard in the first ten years.

In many cases the complexity of standard methods and their vastness can push companies to create a lean-system that gradually creates more and more distance to the official standards, although there is a tendency to use Agile in some areas.

### ***3.2 Relationship between standard used, organizational structure and working sector***

We cross referenced the received data about the organizational structure of the companies and their used standard, to see if there are any correlations between the two data sets.

Agile is the most used standard by the companies organized in a weak matrix or by project oriented. The standard most often used by for example functional

organizations is the PMI standard. It should be noted that project organizations indicated that they use (besides Agile 29%) a not recognized standard. Probably their organization is determined by the project, this forces them to create a personalized methodology not further specified by a strictly formalized standard.

Comparing standard used and working sector we would notice that in the Public administration obviously the most used standard is Hermes (the PM method developed by Switzerland's Federal Administration).

Agile, born in the software development sector, is the most used standard not only in ICT and Services sectors as expected, but in Financial/Insurance and Transport/Circulation sectors, too. PMBOK (PMI) is widely used in quite all the sectors analyzed, even if it is never the most used.

Health and social assistance sectors have probably very specific and wide needs, so they use quite all the standards but mostly customized ones ("others" or "none" answer).

Most working sectors use all standards to varying degrees, others are focused on only a few (Tourism, Services, Education, Financial).

### 3.3 Project management maturity

The data shows that most companies rarely update their processes (45%) and some never update their processes (10%).

Business processes are the key that describe how a company operates in its day-to-day life. To understand whether our processes allow us to be efficient, we compare the frequency of process updates with the efficiency perceived by employees. In companies where process changes are rarely made, the assessment

was either partially efficient (69%) or not very efficient (15%). On the other hand, companies where processes are frequently updated are rated very efficient (92%).

A large proportion of the SMEs questioned in a study by the Swiss Federation for Adult Learning [2] believe that continuous training is very important in order to respond to the impacts of the pandemic. The skills required of employees have changed considerably. One third of the companies surveyed stated that employees are now required to have new or different skills (half of the companies said that the skills had remained the same, while 15% could not answer, suggesting that they have difficulty in assessing developments in this area).

From the graph it can be seen that as many as 87% of the companies only occasionally and regularly carry out training courses to improve their skills in relation to the tasks they perform within the organisation and only 12.9% never carry out training. Furthermore, a deeper analysis of the data showed that the smaller the company, the more likely it is to carry out training courses, while interest decreases slightly as the size of the company increases. This leads us to think that small organisations with growth objectives invest more in training in order to achieve greater competitiveness compared to companies that have consolidated their position in the market.

Only half of the organisations collect and use both Historical Information and Lessons Learned during project management. An interesting relationship emerges when comparing the collection of Lesson Learned and historical information and project success, with 53% of those who collect and use Historical Information and Lesson Learned responding that they almost always achieve project success.

### **3.4 Project manager vs Project Leader**

From the chart you can see that more than 61% of the projects are managed by the Project Manager while the remainder are managed by a project coordinator who coordinates the project. In the next points we will analyze in more detail.

It can be seen that the level of decision-making is generally medium to high, while for project referents the decision-making power is similarly situated but more balanced. In dept, the high decision making is half and half for both PM and PL the same result for the low decision making.

The chart above relates whether or not a PM or PL is trained, and of these how much decision-making power they have. It can be seen that in 28% trained PMs, they also have a fair amount of decision-making power. In comparison, the PL generally does not have specific training.

On the whole, we notice that those who have specific training also have high decision-making power regardless of whether they are PM or PL. On the other hand, those without project training have only a low level of decision-making power. From these data it can be assumed that adequate training in project management is useful in order to be able to have more leadership in the execution of projects.

The graph illustrates that medium and large (>250) companies generally have staff with good decision-making power, and this is a general trend, where the larger a company is, the more they need adequate staff to lead projects.

### 3.5 Program e Portfolio

From the responses received, it emerges that 64.7% of companies manage projects by also using Program and/or portfolio management.

26.7% state that they do not use these tools, while 8.6% state that they are not familiar with them. The sum of these two percentages - 35.3% - is higher than the percentage - 26.1% - of those who said they did not use any standards. This leads to the assumption that even those who do not use a formalized standard, but do use their own methodology, consider it useful to use the techniques of program and portfolio management to coordinate and distribute resources on the various projects followed.

### ***3.6 The Project Management Office (PMO) and its influence***

The project management office (PMO) is a support structure that helps the organization to monitor and control their projects.

A PMO is a group within or outside the organization that defines, maintains and ensures standards for project management within that organization.

It is a centralized overseer and manager of best practices, status and direction of projects.

The influence of the PMO on the organization and the management of the respective projects depends on the type of PMO applied, moving from a more supportive PMO to a managerial PMO with complete control and management of the projects.

In periods like ours, conditioned by both organizational and economic uncertainty, having a PMO is an advantage but can also be a disadvantage.

An advantage is that it allows you to centralize and manage various PMs in a coordinated manner regardless of whether they work locally in the company or in the home-office. But it allows you to keep the status updated and keep it in line with the situation of the projects relative to the business strategy.

The disadvantage is that having a PMO involved are the large costs which are harder to bear in an economically difficult situation. In this chapter we will analyze the behaviour of companies in respect of the adoption of a PMO in this period of uncertainty and how it will affect projects in the company.

The results show that the culture of having a PMO office is not prevalent or widespread.

In fact, 55% of participants have a PMO office for their organization, compared to 42% who do not have a corporate PMO office. 3% of respondents are unaware of what a PMO is or do not know if one exists within their company.

By relating the above figure to the size of the organization we can understand if this has an influence on whether or not they have a PMO office.

The results show that the use of a PMO office is widespread in companies with more than 1,000 employees (78%), while for smaller companies it is not so widespread, with a prevalence of not having a PMO office.

This result can be explained from the fact that using a PMO office has a cost, which is easier to support for companies of large dimensions in contrast to companies of smaller dimensions.

Going into further detail, by aggregating the data related to the application of a PMO office and the industry in which the organization operates, we can understand whether the business environment affects whether or not to have a PMO office.

In almost all sectors, the prevalence is to have a PMO office, and this is little affected by the context in which the company operates. In fact, although with different percentages, the existence of a PMO office is present in practically all sectors in which companies operate.

There are, however, contexts where this practice is more widespread, such as Tourism, ICT, Education and Research, Finance and Insurance, Public Administration and Transport and Circulation.

Some sectors, however, are still oriented towards project management without PMO support, such as the Building and Construction, Electrical Manufacturing and Services sectors.

As mentioned earlier, the PMO can take three forms, which more or less influence the organization and its respective project management:

1. Supportive PMO, with a low degree of control. It has an advisory role to projects, providing best practices, templates and access to historical information and lessons learned from other projects.
2. Controlling PMO, with a moderate degree of control. Ensures support and compliance with project management best practices by adopting specific frameworks or methodologies.
3. Directive PMO, with a high degree of control. Assumes direction and control of the projects themselves, with authority to act as an integrated stakeholder and decision maker during a project.

Analyzing the data shows that the majority of organizations that have a PMO have a Support PMO (43%), followed by a Directive PMO (32%) and finally a Control PMO (25%).

The reason for these results could be due to the fact that, as indicated above, having a PMO is not yet standard practice among organizations. Since the support PMO is less onerous to introduce, it is also the first type introduced in organizations that want to have a PMO and then possibly evolve into the control and management types.

The following chart shows how the type of PMO is linked to company size.

The trend that the results show is that larger companies use a more supportive PMO. The smaller the company size decreases, the more they move towards a management-type PMO.

This result shows how the size of the company affects the type of PMO introduced, a plausible explanation is due to the fact that in smaller companies those who manage projects and those who lead individual projects, as PM, are the same entity and as a result there is a managerial PMO who acts as both manager/coordinator and PM.

Understanding whether the introduction of a PMO office leads to more successful projects being conducted is one of the most interesting outcomes to evaluate.

From the results obtained it seems that the success of projects is not strongly influenced by the presence or absence of a PMO, however, bringing benefits on the success of projects as companies that have a PMO office have approximately 6% more success for the projects carried out.

Organizations that have a PMO, the success of projects (values always and almost always) is 92% compared to the 86% obtained by companies that do not have a PMO office.

Similar results are also obtained for project failure, where values settle at 14% for organizations without a PMO, as opposed to 8% for companies with a PMO office.

### 3.7 Projects Satisfaction and Projects Success

If and how the OS evolves in organizations and in the various sectors (OS standard for all) and by which factors they are influenced (culture, training, success a.s.o.)

- Depending on the work environment and which OS is preferred (Discussed in the chapter)
- The need of training or courses (Discussed in the chapter)
- How all these factors are related to each other (Discussed in the chapter)

An analysis of the data on the success rate of the projects shows that 80% are considered to be satisfied despite the fact that most have encountered problems of different sorts, only a small amount have achieved the goal without difficulties.

Most of the problems encountered mainly timed coordination (24%) and sticking to the budget (18%), but the share related to times and financial resources (29%) is even greater, while the remaining is divided into the combination of factors (23%) and a small amount (6%) is dedicated to problems with the product.

The projects with the greatest satisfaction are led by a project manager (64%) with specific training. In any case the training of the project manager is carried out occasionally for 50% and regularly for 40%, a minority never followed a professional improvement course.

The best managed projects are those who are led by project managers with a high decision-making power.

On the other hand, the projects that did not achieve their purpose correctly (20%) are managed by unskilled people (59%) with medium to low decision-making authority and without the use of industry specific standard methodologies.

This causes the failure to achieve the goal and this led to higher costs in distributed and poorly managed resources, the underestimation of costs and uncontrolled expansion of the project (scope creep).

#### **4 Conclusions**

The vast majority of organizations that took part in the survey have a large size, while most of the others have medium size; the core business with the greatest influence is that which refers to an international scale of users, but it can be seen that that on a national scale also has a certain importance.

Medium-sized and large companies took part in the survey, and the results show that they have already introduced or are preparing to introduce the culture and methodology of Project Management. It can be seen that four out of ten of these companies have their core business at an international level and one out of three at a national level. On the whole, 25% of the companies have a functional structure among which we find the Public Administration and Health and Social Care, and a good 20% have a balanced matrix among which we find mainly the

construction sector and the mechanical and metallurgical sector. As companies face the global market in a pandemic regime, their PM culture has to evolve and keep up with the times. In order to expand their market and/or core business, this adaptation is essential for the survival of the company itself, given the high level of competition that increases complexity in this period of great uncertainty.

The results show that there is an increasing need to invest in PM methodology. In fact, the survey showed that half of the companies have adopted an Agile and/or PM methodology and that in companies that have been operating for more than ten years it has been converted into a customised solution. Further analysis showed that this trend is also followed for the use of specific tools for project management as well as for the management of PM methodology. In most companies, where specific tools for project management or generic tools are used, the introduction of project management has been introduced for more than 10 years and the high decision making is half and half for both PM and PL, the same result for the low decision making.

A high degree of efficiency was found in companies where business processes are updated frequently.

A further investment to improve business efficiency is the creation of the Project Management Office, which can bring a significant advantage in project management. Due to its complexity and the economic effort generated, the PMO is only adopted in medium and large-sized companies. Companies that have introduced the PMO have been able to make a marked improvement in project management. One point that should not be overlooked is that the project management culture must be passed on from the top-management to the entire company in order to solidify the basis for proper project management. In project management the decision-making power of the person in charge of the project is one of the key factors for the success of the project. A careful analysis of the results shows that people who are trained in project management are also the ones who have the most influence and authority in the running of projects, resulting in a significant benefit in achieving project objectives.

This organisational efficiency achieved by applying these methodologies will certainly be the key to success in tackling the current covid-19 global health and economic crisis that is literally changing the whole of business management.

From the educational institution's point of view, the analysis of the results shows us how important it is to have leaders who are trained in terms of project management if we want to carry out successful projects standards such as Agile

and PMI still serve as a basis for most of the companies interviewed, but the tendency over the years is to customise the standard by adapting it to the needs of the individual company. In these terms the university must provide the necessary targeted training according to PM and business sector needs, so that companies can then understand which tools to implement for managing their projects in order to be facilitated in this changing transition.

As well as, the introduction of Smart Working and Home Office in the organisational realities gives the input for the universities to create specific courses at the request of companies or simply online events to promote the culture of project management.

Also courses specified for top management can evolve the culture of project management, if top management increases the knowledge on project management this knowledge will then be disclosed within the company.

### **Abstract**

Although many authors (e.g., Seethamraju & Marjanovic, 2009; Antonucci, 2015; Kokkonen & Bandara, 2015; Antunes & Tate, 2019) recognize a vital role of knowledge in BPM, only a few articles study KM and BPM together. Due to the lack of attention to the topic in the existing literature, defining the scope of possible intersections between BPM and KM could bring an evolution in the research in both areas. To provide detailed grounds of the situation, we reviewed studies simultaneously focusing on KM and BPM. We used the systematic literature review method that consisted of three subsequent stages: literature search, analysis, and interpretation. The literature search goal was to form a sample of articles relevant to BPM and KM overlap. Articles simultaneously focusing on KM and BPM published in the BPM Journal and the Journal of KM were selected based on relevance to the research problem. A content analysis of selected papers was conducted to identify possible intersections between BPM and KM based on suggestions for further research and research gaps identified during the analysis. We identified themes that describe the research focusing on the overlap and connected them with concepts of BPM and KM. The analysis led to developing the framework of BPM and KM overlap and formulation of problems for further research. We found that the overlap is investigated through two main perspectives: knowledge-intensive business processes (kiBPs) and IS/ICT. The kiBPs perspective contains themes such as process-perspective knowledge mapping, KM processes and organizational learning influencing business process improvement, or process modeling influencing KM strategic alignment. The IS/ICT perspective contains themes such as Process KM systems or social BPM systems. The framework of BPM and KM overlap might be beneficial for business professionals as a guideline for selecting best

practices that, once tailored to the organizational context, might increase BPM implementation efficiency and elevate BPM from the “information” level to the “knowledge” level, which will lead to the overall growth of business performance.

**Paper type** – Academic Research Paper

## 1 Introduction

In the face of new challenges such as the Covid-19 pandemic and global switch to remote working, the role of knowledge management (KM) drastically raises in ensuring the continuation of business processes. However, KM strongly relies on collaboration, which is restricted when employees have to work from home. In this situation, KM and business process management (BPM) become as mutually dependent as never before. Thus, the problem of KM and BPM overlap comes to the front line of the research in both fields since business professionals strive to find how to leverage both disciplines’ efficiency.

Some authors (e.g., Bueren et al., 2005) consider KM to be a toolset that can only be applied to business processes. Simultaneously, other authors (e.g., Seethamraju & Marjanovic, 2009) recognize a vital role of knowledge in BPM. Although researchers attempt to develop models that integrate BPM and KM concepts, as summarized by Ranjbarfard et al. (2013), the area of research in this field remains emerging (Dalmaris et al., 2007; Sary, 2014).

Due to the lack of attention to the topic in the existing literature, defining the scope of possible intersections between BPM and KM could bring an evolution in the research in both areas. The systematic literature review is seen as the most appropriate method to answer the following research questions:

*RQ1. What are the overlapping themes of BPM and KM?*

*RQ2. What are the relations between these themes?*

To answer these research questions, we intend to achieve the following objectives:

- 1) Review existing research on overlaps between BPM and KM.
- 2) Develop a framework of BPM and KM overlap.
- 3) Identify potential research directions in the field of BPM and KM overlap.

The paper is organized as follows: Section 2 provides a brief overview of concepts of BPM and KM and introduces several research gaps in the field of BPM and KM overlap found in literature reviews of both disciplines. Section 3 describes the methodology and algorithm of the systematic literature review. Section 4 characterizes the sample of relevant articles quantitatively and qualitatively. Moreover, it introduces the framework of BPM and KM overlap we developed based on the content analysis of relevant papers and maps directions for future BPM and KM overlap research. Section 5 concludes the paper by introducing the impact and limitations of the research.

## **2 Theoretical Background**

In the theoretical background, we conceptualize business process management (BPM) and knowledge management (KM) with particular attention to their intersections and emphasize the research gaps related to the overlap of BPM and KM specified in the recent literature.

### ***2.1 Business process management***

BPM is an integrated management methodology that includes practices aimed at changing business processes to improve organizational performance. The most frequent understanding of the BPM concept in academic literature is twofold. First, BPM could be described through a set of associated activities forming the BPM lifecycle. Several authors (e.g., Kirchmer, 2017; Dumas et al., 2018; Weske, 2019) agree that the BPM lifecycle includes business process discovery, analysis, and redesign (i.e., improvement). Second, BPM could be perceived as an organizational capability (e.g., Skrinjar & Trkman, 2013; Rosemann & vom Brocke, 2015). Rosemann & vom Brocke (2015) break down the BPM capability into six core elements: Strategic Alignment, Governance, Methods, Information Technology, People, and Culture.

Knowledge of process stakeholders, also referred to as “process knowledge” (e.g., Antunes & Tate, 2019), is considered the main component of the People element of BPM capability (Kokkonen & Bandara, 2015). Dumas et al. (2019) claim that explicit process knowledge resides in organizations’ process models and process descriptions – knowledge objects that play an essential role in BPM lifecycle activities (e.g., process discovery).

Several research gaps are identified in recent literature regarding the overlap of BPM and KM. Badakhshan et al. (2019) suggest assessing the impact of agile BPM on continuous utilization of skills and knowledge of people aimed at continuous value creation. Thenakoon et al. (2018) point out several gaps in BPM training. In particular, what BPM knowledge is required in the training content and which results will BPM training produce. Zemguliene & Valukonis (2018) highlight the importance of future research in integrating external and internal information flows, including knowledge of stakeholders' needs, with BPM systems to support business process improvement initiatives. Roeser & Kern (2015) stress that the People factor of BPM maturity, which includes knowledge as its main component, should be researched more thoroughly in the future.

## **2.2 Knowledge management**

Several authors (e.g., Gold et al., 2001; Chang & Chuang, 2011) perceive knowledge management (KM) as a set of infrastructure and process capabilities that lead to competitive advantage. Infrastructure capabilities include IT, organizational structure, and culture, while various KM processes present process capabilities. Authors consider knowledge acquisition (e.g., He et al., 2013), codification (e.g., Razzag et al., 2019), sharing (e.g., Wang & Wang, 2012), application/utilization (e.g., Lin & Lee, 2005), and protection (e.g., North & Kumta, 2018) as KM processes. Liyanage et al. (2009) unite most KM processes in the knowledge transfer (KT) model and stress that KT allows companies to improve business processes. However, Liyanage et al. (2009) leave the relation between KT and process performance without any examination.

Several research gaps are identified in recent literature regarding the overlap of KM and BPM. Pérez-Salazar et al. (2017) emphasize that the influence of some KM processes (i.e., knowledge creation, storage, and application) on the objectives of supply chain management (i.e., a well-known example of a business process) is under-researched. Martelo-Landroguez & Cepeda-Carrión (2019) highlight the potential of researching the influence of knowledge acquisition and protection on organizational value creation and capture, which are considered the main aims of business process execution (e.g., Dumas et al., 2019). Escrivão & da Silva (2019) suggest considering a process dimension in KM maturity models. Ramy et al. (2015) reveal the research gap in KM application in knowledge-intensive industries, which can also be analyzed via the BPM perspective. Lönnqvist &

Laihonen (2016) also stress the importance of further research in managing knowledge-intensive organizations. The performance of such organizations, by definition, is strongly influenced by KM and BPM.

To sum up, there is a high demand for future research in BPM and KM overlap documented in literature reviews in both disciplines. Researchers agree on the need to integrate BPM and KM maturity models' concepts and see the potential in further research of mutual influence of KM processes and business processes improvement. Moreover, knowledge-intensive organizations are referred to as one of the most perspective objects for research in BPM and KM overlap since both managerial disciplines strongly influence their performance.

### 3 Methodology

By conducting a structured literature review (SLR), we aim to identify concepts in which BPM overlaps with KM and relations between these concepts. This section describes an SLR algorithm to ensure transparency regarding the decisions made during the review process, including literature search, extracting relevant research, and content analysis.

We decided to review scholarly articles from the Business Process Management Journal (BPMJ; ISSN 1463-7154) and the Journal of Knowledge Management (JKM; ISSN 1367-3270). As journals directly targeting BPM and KM communities, they ensure the relevance of the published materials. To cover articles that focus on overlaps between BPM and KM concepts, we have applied several search queries in Scopus and Web of Science (WoS) databases, moving from narrow to broad search definition, as presented in Table 1.

Table 2: Approach to the identification of potentially relevant papers

Nº	Query	Short description	Database	Results
1	TS=("business process management" OR BPM OR BPMS) AND AK=("knowledge" or "knowledge management" or KM or KMS) AND SO=(business process management journal OR journal of knowledge management)	BPM and KM and knowledge in BPMJ and JKM	WoS	7
2	( TITLE-ABS-KEY ( "business process management" OR bpm OR bpms ) AND TITLE-ABS-KEY ( "knowledge management" OR kim OR kms ) AND ISSN ( 1463-	BPM and KM in BPMJ and JKM	Scopus	12

Nº	Query	Short description	Database	Results
	7154 ) OR ISSN ( 1367-3270 ) )			
3	TOPIC: ("knowledge management" or KM or KMS) AND TOPIC: ("business process management" or BPM or BPMS) AND PUBLICATION NAME: ("business process management journal" OR "journal of knowledge management")		WoS	13

Source: Elaborated by the authors

Figure 1 presents the SLR protocol we used in our research.

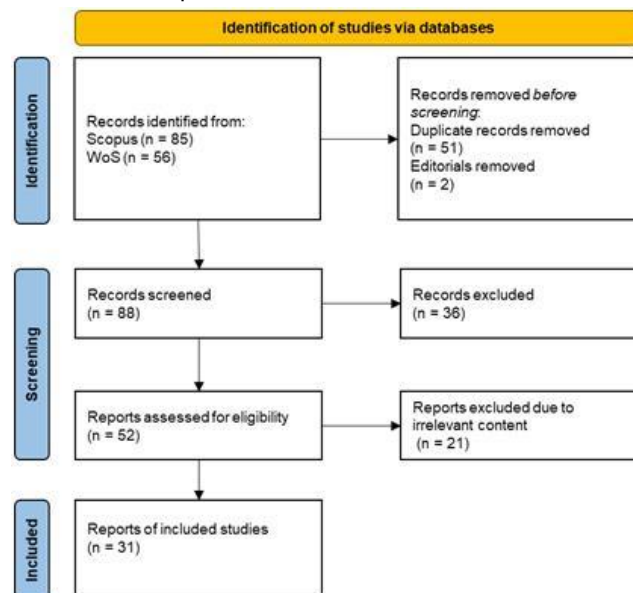

Figure 1: Systematic literature review protocol

Source: Elaborated by the authors based on Page et al. (2021)

At first, we identified 141 records from Scopus and WoS by applying queries presented in Table 1. After duplicates and editorials were removed, there were 88 papers left to construct an initial sample. Each of these papers was scanned for keywords related to KM (i.e., "knowledge management") and BPM (i.e., "business process" and "process management"). 36 papers were excluded from the sample because they do not contain these keywords in the main text. 52 papers left after scanning were read more carefully, and 21 were classified as irrelevant to the topic after reading. Thus, we concluded the literature search by including in the final sample 31 papers that we considered relevant.

## **4 Findings**

This section characterizes the sample of relevant papers quantitatively by source, year, and method (see sub-section 4.1) and qualitatively by introducing and describing the most common themes referred to in relevant papers (see sub-section 4.2). Then, the framework of BPM and KM overlap is presented in sub-section 4.3, leading to the identification of directions for further research presented in sub-section 4.4.

### **4.1 Quantitative results of research**

The final sample of 31 relevant papers includes 25 papers from the Business Process Management Journal (BPMJ) and 6 papers from the Journal of Knowledge Management (JKM). As shown in Figure 2, the interest in BPM and KM overlap first appeared in 2003. Around 2 papers per year were dedicated to the topic from 2003 to 2009. After a decrease in the interest to the topic from 2010 to 2014, the recent research stage in BPM and KM overlap started in 2015. The maximum interest in the topic was registered in 2019 when 5 relevant papers on the topic were published.

*Figure 2: Relevant papers by year*  
*Source: Elaborated by the authors*

Figure 3 shows the distribution of relevant papers by a method. Theoretical papers (i.e., Marjanovic, 2005; Szelagowski & Berniak-Wozny, 2019) critically analyze existing concepts, while conceptual papers (e.g., Capuano et al., 2008; Sarnikar & Deokar, 2017) introduce new ones (without validating them). Case studies (e.g., Stry, 2014; Rengiha et al., 2016) test introduced concepts qualitatively, while surveys (e.g., Aureli et al., 2019; Nguyen & Harrison, 2019) utilize quantitative analysis of data collected via questionnaires.

*Figure 3: Relevant papers by a method*  
*Source: Elaborated by the authors*

As seen from Figure 3, papers from the JKM primarily focus on developing new concepts and sometimes include qualitative validation (i.e., Papavassiliou &

Mentzas, 2003; Stary, 2014). Simultaneously, papers from the BPMJ mainly focus on qualitative and quantitative validation of developed concepts.

#### 4.2 Qualitative results of research analysis

The content analysis allowed us to reveal 9 main themes in the relevant papers: learning, natural integration, business process improvement (BPI), KM processes, KM strategic alignment, process modeling, process-perspective knowledge mapping, IS/ICT, and knowledge-intensive business processes (kiBPs). As seen in Table 2, these themes were appearing in relevant papers with different densities.

Table 3: Themes in sample

Rank	Source (N = 31)	Number of themes (Total = 9)	kiBPs (+/-)	IS/ICT (+/-)
1	Sarnikar & Deokar, 2017	6	+	+
2	Bueren et al., 2005	3	+	-
3	Chión et al., 2019	3	+	-
4	Kalpič & Bernus, 2006	3	+	-
5	Ranjbarfard et al., 2013	3	+	-
6	Seethamraju & Marjanovic, 2009	3	+	-
7	Silva & Rosemann, 2012	3	-	+
8	Al-Sa'di et al., 2017	2	+	-
9	Apostolou & Menstaz, 2003	2	+	-
10	Aureli et al., 2019	2	+	-
11	Chatzoudes et al., 2015	2	+	-
12	Dalmaris et al., 2007	2	+	-
13	Liao & Bernes, 2015	2	+	-
14	Mahoomadzadeh et al., 2019	2	+	-
15	Marjanovic, 2005	2	+	-
16	Papavassilou & Mentzas, 2003	2	+	-
17	Rehman & Iqbal, 2020	2	+	-
18	Szelagowski & Berniak-Wozny, 2019	2	+	-
19	Zhang, 2018	2	+	-
20	Kang et al., 2003	2	+	-
21	Stary, 2014	2	-	+
22	Adamides & Karacapilidis, 2006	2	-	+
23	Lavikka et al., 2015	2	-	-
24	Nguyen & Harrison, 2019	2	-	-
25	Rangiha et al., 2016	1	-	+

<b>Rank</b>	<b>Source (N = 31)</b>	<b>Number of themes (Total = 9)</b>	<b>kiBPs (+/-)</b>	<b>IS/ICT (+/-)</b>
26	Andriani et al., 2019	1	-	-
27	Capuano et al., 2008	1	-	-
28	Dezi et al., 2018	1	-	-
29	Lee et al., 2007	1	-	-
30	Macris et al., 2008	1	-	-
31	Ungan, 2006	1	-	-

*Source: Elaborated by the authors*

In Table 2, the kiBPs theme is distinguished to the separate column since it can be perceived as a perspective through which most of the other themes can be examined. The IS/ICT theme cannot be perceived through the kiBPs perspective and thus distinguished in a separate column.

The term kiBPs is also referred to as dynamic (Szelagowski & Berniak-Wozny, 2019), emergent (e.g., Marjanovic, 2005), semi-structured, ill-structured, and unstructured (e.g., Kalpič & Bernus, 2006) processes. These processes are characterized by high complexity and knowledge intensity (e.g., Aureli et al., 2019). The examples of kiBPs are innovation process (e.g., Al-Sa'di et al., 2017), coordination process (e.g., Marjanovic, 2005), creative problem-solving process (e.g., Aureli et al., 2019), customer relationship management (CRM) process (e.g., Bueren et al., 2005), and knowledge management (e.g., Apostolou & Mentzas, 2003; Rehman & Iqbal, 2020).

Relevant papers that include the IS/ICT theme refer to Process-oriented KM systems (PKMS) and social BPMS (sBPMS). In recent years, several studies (e.g., Kang et al., 2003; Marjanovic, 2005; Mahmoodzadezh et al., 2009; Stary, 2014) focused on the integration of KM systems (KMS) and BPM systems (BPMS). Sarnikar & Deokar (2017) summarized previous findings regarding the integration of BPMS and KMS under the concept of PKMS. Rangiha et al. (2016) define social BPM as "the engagement of relevant stakeholders throughout the BPM lifecycle by utilizing social software features." Once involved in BPM, process stakeholders share process knowledge and collaborate on different BPM lifecycle stages such as process improvement and execution (e.g., Rangiha et al., 2016) and business process modeling (e.g., Adamindes & Karacapidilis, 2006; Silva & Rosemann, 2012). Such involvement is typically conducted via specially set BPMS, which we call social BPMS (sBPMS).

### 4.3 Framework of BPM and KM overlap

Based on the content analysis of the relevant papers, we suggest a framework that can be used to structure current and future research in overlapping themes of BPM and KM. As presented in Figure 4, the framework is constructed using themes revealed during the content analysis. The framework includes two perspectives (i.e., kiBPs, and IS/ICT) and encounters three types of relationships between BPM and KM: BPM influences KM, BPM is influenced by KM, and BPM and KM mutually influence each other.

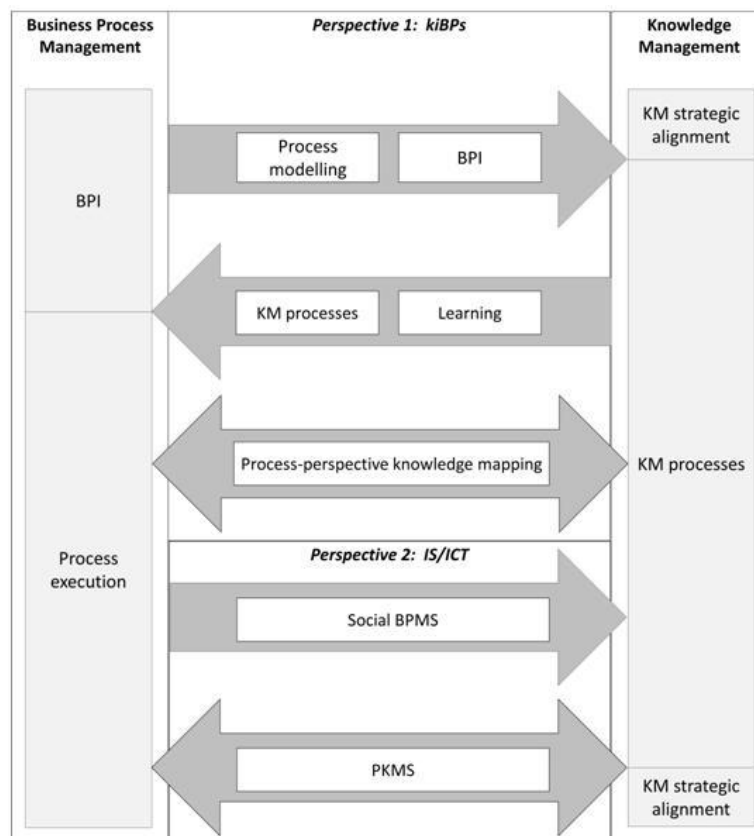

Figure 4: Framework of BPM and KM overlap  
Source: Elaborated by the authors

From the perspective of kiBPs, there are three types of relationships between BPM and KM: BPM influences KM, BPM is influenced by KM, and BPM and KM mutually influence each other.

Lavikka et al. (2015) and Zhang (2018) highlight the positive impact of process modeling on knowledge sharing (i.e., KM process) and thus allow us to conclude that BPM positively influences KM processes. This statement is proved by Dezi et al. (2018) and Lavikka et al. (2015), who discovered an increasing interest in the link between BPM and ambidextrous KM processes, which include exploitation of existing internal knowledge (Lavikka et al., 2015) and exploration of new external knowledge (e.g., Liao & Bernes, 2015; Nguyen & Harrison, 2019). Moreover, some authors (e.g., Kalpič & Bernus, 2006) highlight the facilitating role of BPM concerning externalization and internalization of knowledge – components of the SECI model developed by Nonaka & Takeuchi (1995). BPM also positively influences KM strategic alignment. Andriani et al. (2019) claim that business processes align KM strategy with the enterprise's business strategy.

Chión et al. (2019) stress that KM processes (i.e., knowledge acquisition, knowledge creation, knowledge sharing, and knowledge application) have a positive influence on the effectiveness of the business process improvement (BPI) activities. Several authors (e.g., Dalmaris, 2007; Seethmaraju & Marjanovic, 2009; Ranjbarfard, 2013; Nguyen & Harrison, 2019) provide evidence for the reliability of this relationship. However, the prevailing research trend in this field is to focus explicitly on knowledge sharing, ignoring other KM processes. For instance, the findings of Chión et al. (2019) and Aureli et al. (2019) confirm the significant effect of knowledge sharing on process improvement. Moreover, Mahmoodzadezh et al. (2009) claim that KM is a significant critical success factor for business process outsourcing. In other words, KM processes positively influence process execution.

In recent research, special attention is given to KM support of knowledge-intensive business processes (kiBPs) provided via KM processes such as knowledge sharing, knowledge collection, and knowledge reuse (Marjanovic, 2005; Sarnikar & Deokar, 2017). Another direction of KM support is learning (e.g., Sarnikar & Deokar, 2017; Lavikka et al., 2015), and several models were developed in this regard (e.g., Stary, 2014; Capuano et al., 2008). Several authors (e.g., Sarnikar & Deokar, 2017; Aureli et al., 2019) agree that the amount of KM support should grow with the growth of knowledge-intensiveness of the business processes. In other words, the strength of KM processes on process improvement and execution rises along with the knowledge intensity of the business processes.

This statement is confirmed by Seethmaraju & Marjanovic (2009) and Chi3n et al. (2019), who define business process improvement as a kiBP.

Process-perspective knowledge maps (Kang et al., 2003) integrate knowledge mapping and process modeling. Reflecting on the fact that knowledge is deeply embedded in business processes (e.g., Macris et al., 2008; Ranjbarfad et al., 2013; Szelagowski & Berniak-Wozny, 2019), produced and consumed during the business process execution (Sarnikar & Deokar, 2017), process-perspective knowledge maps deal with the knowledge specific to the particular task of the business process.

Process-perspective knowledge maps raise awareness of KM resources within knowledge workers who execute these processes, which is an essential factor in better utilization of KM resources (Sarnikar & Deokar, 2017). On the one hand, this fact can be interpreted because process-perspective knowledge maps support knowledge application/utilization (i.e., KM process). On the other hand, they increase the efficiency of process execution.

From the IS/ICT perspective, we identified two types of relationships between BPM and KM: BPM influences KM, and BPM and KM mutually influence each other.

Chatzoudes et al. (2015) claim that collaboration enabled by sBPMS positively influences KM. Silva & Rosemann (2012) and Rangiha et al. (2016) especially highlight the role of sBPMS in leveraging knowledge sharing (i.e., KM process).

PKMS simultaneously affect KM and BPM. According to a summary by Sarnikar & Deokar (2017), PKMS support KM processes, including knowledge acquisition, creation/codification, sharing, application/utilization. Moreover, Stary (2014) highlights the role of knowledge repositories, which “allow reconfiguring previously produced [knowledge] and tie [it] to running codification schemes and business processes” and thus stresses the fact that PKMS support another KM process – knowledge protection. Moreover, Sarnikar & Deokar (2017) stress that PKMS allows for incorporating KM processes’ performance measures, ensuring their alignment with objectives of business processes. In other words, PKMS support KM strategic alignment.

As for the influence of PKMS on BPM, Sarnikar & Deokar (2017) claim that PKMS personalize the delivery of knowledge to process and ensure accessibility of knowledge sources, which positively influences process execution.

#### **4.4 Analysis of research gaps**

We clustered suggestions found in the sample to identify existing research gaps and critically evaluated the framework of BPM and KM overlap described in the previous section. Since research on BPM and KM overlaps is fragmented, many authors highlight the need to prove existing overlaps in various settings: (a) for different industries (Al-Sa'di et al., 2017; Dezi et al., 2018; Chi6n et al., 2019; Nguyen & Harrison, 2019; Aureli et al., 2019; Andriani et al., 2019), (b) for different organizational settings (Zhang, 2018), (c) for different processes (Capuano et al., 2008; Ranjbarfard et al., 2013), and (d) for different control variables (Al-Sa'di et al., 2017; Chi6n et al., 2019).

Moreover, we identified several directions for future research that we consider the most perspective in their ability to accelerate the research of BPM and KM overlap in topics such as kiBPs, KM processes, and formalization of KM and BPM overlap.

Talking about future directions in kiBPs, Ranjbarfard et al. (2013) see the need to classify kiBPs. Moreover, Bueren et al. (2005) and Dalmaris et al. (2007) draw attention to the development of kiBPs performance measures. At last, Marjanovic (2005) suggests further investigate different aspects of KM support of kiBPs.

As for KM processes, Seethmaraju & Marjanovic (2009) stress the importance of researching transferring KM processes from one BPI project to another. Lavikka et al. (2015) suggest identifying barriers for exploitative and explorative KM processes and continuing researchings KM processes from the organizational ambidexterity perspective.

At last, Szelagowski & Berniak-Wozny (2019) stress that current BPM maturity models should be adopted to capture aspects of kiBPs management. In other words, the authors suggest formalizing the overlap of BPM and KM in the form of maturity models and encountering structured and knowledge-intensive business processes when estimating organizational maturity in BPM.

Two additional directions for further research were also identified after critical examination of the framework of BPM and KM overlap. First, most of the relevant sources from the researched sample focus on knowledge sharing omitting other KM processes. This fact is also noticed by Lee et al. (2007), Liao & Barnes (2015), and Al-Sa'di et al. (2017). Therefore, studying the influence of knowledge acquisition, knowledge creation, knowledge application, and knowledge protection on the process improvement and linking KM processes with stages of

BPM lifecycle (i.e., process discovery, process analysis, and process enactment) are seen as perspective directions for further research. This research direction is also suggested.

Second, most analyzed sources (e.g., Lavikka et al., 2015; Zhang, 2018) primarily focus on factors that influence knowledge sharing and do not pay any attention to critical success factors of other KM processes. Therefore, studying the influence of various critical success factors, including BPM activities (e.g., process discovery, process modelling) and social BPMS on knowledge acquisition, knowledge creation, knowledge application, and knowledge protection, is considered a direction for further research.

## **5 Conclusion**

By conducting a systematic literature review on the overlap of BPM and KM, we developed the framework for BPM and KM overlap and mapped directions for future research. Although the framework is grounded in theory, we consider explicit focus on scholarly articles from the Business Process Management Journal and the Journal of Knowledge Management the main limitation of our systematic literature review. Although this allowed us to ensure targeted identification of relevant papers, the explicit focus on two journals led to a narrow sample of 31 papers. This data insufficiency led to the high level of abstraction in the framework of BPM and KM overlap. To overcome the limitations mentioned above, in future research, we plan to expand the sample by including other scientific journals, using backward and forward searches, and updating our search queries with keywords revealed in this systematic literature review. This will allow us to extend the framework of BPM and KM overlap and investigate overlapping themes for both disciplines on lower levels of abstraction.

Nevertheless, our paper contributes to BPM and KM fields in two ways. First, the framework might serve as a starting point for researchers interested in investigating the relationship and overlaps of BPM and KM. Second, we identified problems for future research in BPM and KM that could be followed to extend the current body of knowledge in the field. The framework of BPM and KM overlap might also be beneficial for business professionals as a guideline for selecting best practices that, once tailored to the organizational context, might increase BPM implementation efficiency and elevate BPM from the “information” level to

the “knowledge” level, which will lead to the overall growth of business performance.

### Abstract

**Purpose-** This paper explores the relationship between Entrepreneurial capital (EC), Leadership and Innovation performance (IP) in small and medium enterprises (SMEs) of the high-tech sector in Argentina.

**Design/methodology/approach-** For this study survey data were collected in small and medium sized high-tech firms in Argentina using scales previously validated internationally. The data were collected from November 2020 to March 2021 (excluding the analysis of COVID-19 influence, and referring to year 2019) by mailing to the companies' CEOs. The final sample comprises 200 companies from the technology-based sector located in Argentina. Hypothesis were tested using structural equation modelling in ADANCO.

**Originality/value-** There is scarce research carried on how Entrepreneurial capital and leadership influence innovation performance as a key factor for survival in crisis times, for small and medium sized high-tech firms. This study aims to fill the literature gap by exploring the relationship between the Entrepreneurial capital (EC), the CEO leadership and

the Innovation performance of technology-based small and medium enterprises (SMEs) on an emerging economy.

Practical implications- This study brings useful and valuable information to managers of small and medium sized enterprises of the high-tech sector, by identifying the importance of entrepreneurial capital (EC) and leadership impact on innovation performance.

**Keywords** – Intellectual capital – Entrepreneurial capital - Leadership- Innovation Performance – Small and medium sized-firms - SMEs.

**Paper type** - Academic Research Paper

## 1 Introduction

The current changing and uncertain times companies are operating in force them to innovate in order to survive (Nguyen, 2018; North & Varvakis, 2016; Zhang, Zheng, & Ning, 2018). In this context, knowledge is a key resource for firm innovativeness and competitiveness (Davila, Varvakis, & North, 2019).

A widely accepted definition describes innovation as the implementation of new or significantly improved product or service, process, new organizational or marketing method in business practices, workplace organizations or external relations (OECD, 2005).

In order to be more effective in innovation, organizations have to be focused on how they manage intellectual capital (Cabrilo & Dahms, 2018).

*Intellectual capital (IC)* is defined as the sum of all knowledge assets that firms use to attain a competitive advantage and is divided traditionally into three components – human capital (HC), structural capital (SC) and relational capital RC (RC) (Bontis, 1998; Edvinsson & Malone, 1997; Subramaniam & Youndt, 2005). However, deeper understanding of the knowledge-based antecedents of innovation suggest including a novel type of capital, the entrepreneurial capital (EC) (Cabrilo, Kianto, & Bojana, 2018). This capital is defined as a stock of competences and employee's attributes related to identify business opportunities, take risks, be proactive, innovative and make difficult decisions (Cabrilo et al., 2018; Demartini & Paoloni, 2014; Erikson, 2002).

According to some authors, intellectual capital is considered a main driver of innovation in the knowledge based economy (Buenechea-Elberdin, Sáenz, & Kianto, 2018; Cabrilo & Dahms, 2018; Delgado-Verde, Martín-De Castro, & Amores-Salvadó, 2016; Inkinen, 2015; W. Wendra, Sule, Joeliaty, & Azis, 2019).

In this line, due to the fact that entrepreneurial capital is associated with innovation and creativity, it deserves special attention (Crespo, Curado, Oliveira, & Munoz-Pascual, 2021; Demartini & Paoloni, 2014; Paoloni, Coluccia, Fontana, & Solimene, 2020).

In small and medium sized enterprises (SMEs) knowledge management has been a core component to use employees' tacit and explicit knowledge to increase internal business innovation and leverage such in this global competitive business environment (Ajibade, 2016). Although, managers and owners of these type of companies are aware of growth potential, they tend not communicate that strategy to employees (North, Bergstermann, & Hardwig, 2016).

In this regard, the figure of the leader of the company becomes extremely relevant. Leaders able to motivate and encourage other employees can be a great competitive advantage of an enterprise (Hitka et al., 2019).

Furthermore, the leadership of the CEO influences the innovation behaviours of their employees especially in small and medium sized enterprises (SMEs) of high-tech firms (Busola Oluwafemi, Mitchelmore, & Nikolopoulos, 2020).

In the case of small and medium enterprises (SMEs), especially the technology-based firms, the ability to overcome adversity under highly changing and turbulent environments highlights the importance of the capability to innovate in order to develop and maintain competitive advantage (Bueno & Moreno, 2019; North & Varvakis, 2016).

A gap in the literature, regarding the importance of entrepreneurial capital and leadership to boost innovation performance in emerging countries in high-tech firms has motivated this study (Cabrito et al., 2018; Caridi-Zahavi, Carmeli, & Arazy, 2015; Wendra Wendra, Sule, Joeliaty, & Azis, 2019). Consequently, the purpose of this research is to explore how entrepreneurial capital and the CEO leadership influences the innovation performance of high-tech SMEs in Argentina.

## **2 Theoretical Background and hypotheses**

### ***2.1 Leadership and Entrepreneurial capital (EC)***

In order to maintain a competitive advantage in the current turbulent environment, particularly for SMEs of the high-tech sector, leaders are constantly challenged to leverage the intellectual capital of their firms to thrive (Busola Oluwafemi et al., 2020; Makri & Scandura, 2010). The majority of the past studies

consider that IC include human skills, expertise and motivation (human capital); processes, systems, solutions, databases, patents and IPs (structural capital) and the value shown in the network of relationships (relational capital) (Kianto, Ritala, Spender, & Vanhala, 2014). Recently, academic researchers proposed entrepreneurial capital as a novel component of intellectual capital, which is related to entrepreneur behaviour performed by organizational members (Cabrilo et al., 2018; Demartini & Paoloni, 2014; Inkinen, Kianto, Vanhala, & Ritala, 2017; Kianto et al., 2014; W. Wendra et al., 2019). Entrepreneurial capital is defined as a stock of competences and the employees' attributes related to proactive, risky, innovative, and aggressive decision-making (Cabrilo et al., 2018; Demartini & Paoloni, 2014; Erikson, 2002; Firkin, 2003).

Leadership strongly affects intangible assets and effective leaders have awareness regarding the value of their staff for enabling change (Alrowwad, Abualoush, & Masa'deh, 2020; Cortes & Herrmann, 2020). In this regard, leaders have a vital influence on the creativity and innovative behaviour of employees by communicating and encouraging a shared vision (Caridi-Zahavi et al., 2015; Khalili, 2017).

In high-technology industries, CEOs must create a climate that encourages exploration and risk taking, that fosters innovation (Makri & Scandura, 2010). According to previous studies, it would be expected that the effects of leadership would occur through the behaviours of employees (Makri & Scandura, 2010). The CEO leadership shapes an organizational context of openness and work environment in which employees create new opportunities for new knowledge creation and cultivate relational connectivity, which enhance a firm's innovation performance (Caridi-Zahavi et al., 2015). A clear direction demonstrated by the CEO as a vision that encourages and inspires employees can foster new ideas that may lead to innovation. This vision is supported and goes in hand with the CEO leadership behaviours (Caridi-Zahavi et al., 2015). Leadership at the top management positions appears to be an important antecedent of a firm's ability to innovate because the CEO has an important impact on the development of the organizational vision and the strategies to attain that vision (Makri & Scandura, 2010).

In this study, is considered that assuming a direct influence of a CEO's leadership on firm innovation performance may not take into consideration the mechanism that support this process, where leaders create the environment for

entrepreneurial behaviours among organizational members that drives innovation performance of the firm (Caridi-Zahavi et al., 2015).

A clear direction demonstrated by the CEO as a vision that encourages and inspires employees can foster new ideas that may lead to innovation. (Busola Oluwafemi et al., 2020; Caridi-Zahavi et al., 2015).

Following the ideas stated above, the next hypothesis is proposed:

*H1. Leadership (L) influences Entrepreneurial capital (EC) in SMEs of the high-tech sector.*

## **2.2 Entrepreneurial capital (EC) and Innovation**

It is considered that innovation is a vital key to organizations survival on turbulent and changing environments (Dabić, Lažnjak, Smallbone, & Švarc, 2019; North & Varvakis, 2016). Intellectual capital and innovation are intrinsically related, and it is widely accepted that leveraging intellectual capital creates a competitive advantage for driving innovation (Buenechea-Elberdin et al., 2018; Yitmen, 2011). This linkage has been widely analysed by numerous studies (Cabrito et al., 2018; Nguyen, 2018; Omerzel & Jurdanab, 2016; Subramaniam & Youndt, 2005). However, the majority of these studies leave aside the influence of entrepreneurial capital on innovation performance.

It has been found that entrepreneurial capital influences innovation of a firm (Hughes & Morgan, 2007). Furthermore, the technology level of the firm generates mayor differences in the entrepreneurial capital and innovation performance relationship (Buenechea-Elberdin, Sáenz, & Kianto, 2017).

Studies of the intellectual capital and innovation relationship have shown a tendency to investigate the human side of intangibles from a traditional perspective, examining only attributes such as professional qualifications, skills and motivation of employees and more specific attributes that may be relevant in this context were not included (Buenechea-Elberdin et al., 2017). Aspects such as proactive, risky, innovative, and aggressive decision-making must be contemplated (Demartini & Paoloni, 2014). In this matter, as mentioned a novel type of intellectual capital has emerged, the entrepreneurial capital (Cabrito et al., 2018; Demartini & Paoloni, 2014; Inkinen et al., 2017; Kianto et al., 2014; Wendra Wendra et al., 2019).

Innovation is enhanced by entrepreneurial capital because it encourages risk taking and creating new knowledge (Buenechea-Elberdin et al., 2017).

In accordance with was stated, the next hypothesis is proposed:

*H2. Entrepreneurial capital (EC) influences the innovation performance in SMEs of the high-tech sector.*

### **3 Research Method**

#### **3.1 Sample and data collection**

The population considered in this study consists of Argentinian SMEs firms of the high-tech sector. The definition of the Ministry of Productive Development has been used to identify SMEs firms. The target enterprises were selected from Technology Clusters across the country. The data was collected from November 2020 to March 2021, (excluding the analysis of COVID-19 influence, and referring to year 2019) by mailing to the companies' CEOs. A sum of 227 responses were collected, representing a response rate of approximately 10%. After excluding 27 responses with incomplete data or ungagged responses, a sample of 200 where achieved for further analysis. Confidentiality was guaranteed to all participants. The aim was to obtain a representative sample of the composition of Argentinian high-tech SMEs.

#### **3.2 Measures**

For measuring leadership it was use part of the scale of the creative and innovative leadership developed by Khalili (2017), using its second component of encouraging shared vision, composed by eight items and that was built considering different research models for leadership. Components were measured with five-point Likert scales (where 1 = strongly disagree and 5 = strongly agree).

For measuring entrepreneurial capital the scale developed by Kianto and colleagues were used (Inkinen, Kianto, Vanhala, & Ritala, 2014). Components were measured with five-point Likert scales (where 1 = strongly disagree and 5 = strongly agree).

Measures for innovation performance were developed by using the Weerawardena scale (Weerawardena, 2003). Components were measured with five-point Likert scales (where 1 = strongly disagree and 5 = strongly agree).

This study considers firm size and firm age as control variables. Each variable is represented by the logarithm of the number of employees and the logarithm of the number of year operating.

### **3.3 Statistical analysis**

Structural Equation Modelling (SEM) was used to test the hypotheses, which is a family of statistical techniques that has the ability to model latent variables and to test theories (Henseler, Hubona, & Ray, 2016). SEM combines multiple regression concerns and factor analysis in order to estimate a number of dependency relationships and identify the collective strength of multiple variables (Creswell, J. W., & Creswell, 2014). In this research, variance-based partial least squared technique (PLS-SEM) is used due to its predictive capability (Hair, Sarstedt, Hopkins, & Kuppelwieser, 2014; Henseler et al., 2016).

The PLS-SEM modelling is carried out by ADANCO Software, and is analysed and interpreted in two stages (Hair et al., 2014; Henseler et al., 2016). First, reliability, convergent validity and discriminant validity of the measurement model is analysed. Second, the structural model is assessed. The Standardized Root Mean Square Residual (SRMR) is examined as model fit criteria. The adjusted-R<sup>2</sup> is analysed, which is the amount of variance of dependent variables explained by the model.

For testing research hypothesis the statistical significance of path between constructs are examined, and bootstrapping procedure is executed to obtain the confidence intervals and statistical significance of the hypothesis

## **4 Results**

In this section, results of the assessment of the measurement model and the structural model are presented to test the developed hypotheses.

### **4.1 Measurement model.**

Evaluating the measurement model is for testing how accurately measured and well represented are the constructs (Hair et al., 2014).

Due to all constructs in the tested model are reflective, individual item reliability, construct reliability, convergent validity, and discriminant validity

should be ascertained (Henseler et al., 2016). The definitions of the scale items can be found in the annex (Table A1).

Three reliability coefficients for latent constructs were assessed: Cronbach's Alpha, composite reliability and rho A. After evaluation, all scores were acceptable and tested above 0.7 (Henseler et al., 2016). (Table 1).

For testing convergent validity, the average variance extracted (AVE) was evaluated for latent variables and it was verified that all scores were above 0.5, showing that the constructs explain more than half of the variance of its indicators (Hair et al., 2014). Also each item has outer loadings above 0.7, supporting a suitable convergent validity (Henseler et al., 2016). (Table 1).

The next step for assessing the measurement model is evaluating the discriminant validity, which represents how constructs are empirically different from each other's (Hair et al., 2014).

Discriminant validity is assessed by the Fornell and Larcker (1981) criterion, by verifying that the square root of AVE of each construct is higher than the construct correlation with each other of the model (Henseler et al., 2016). In addition, descriptive statistics of the constructs are presented. (Table 2).

Table 1– Results of assessment of the measurement model

Construct	Indicator	Loadings	Cronbach's Alpha	Rho A	Composite Reliability	AVE
Entrepreneurial capital	EC2	0.789	0.860	0.871	0.905	0.703
	EC3	0.865				
	EC4	0.851				
	EC6	0.847				
	EC1	Excluded				
	EC5	Excluded				
Innovation Performance	INN1	0.721	0.811	0.815	0.869	0.570
	INN2	0.831				
	INN3	0.743				
	INN4	0.724				
	INN5	0.751				
Leadership	L1	0.830	0.932	0.934	0.944	0.678
	L2	0.874				
	L3	0.822				
	L4	0.817				

L5	0.768
L6	0.880
L7	0.756
L8	0.831

Table 2 – Descriptive statistics and correlations of constructs

Construct	Mean	EC	INN	L	FS	FA
EC. Entrepreneurial capital	3.301	0.703				
INN. Innovation Performance	3.667	0.218	0.571			
L. Leadership	3.980	0.300	0.313	0.678		
FS. Firm Size	40.600	0.014	0.024	0.010	1.000	
FA. Firm Age	16.990	0.007	0.001	0.046	0.124	1.000

\*Square root of AVE in diagonal

Source: Results of this study

#### 4.2 Structural model.

The model used to test the hypotheses (Figure 1), after executing the bootstrapping procedure showed an index of 0.060 SRMR, below the maximum of 0.08 (Henseler et al., 2016).

The results after running the bootstrapping provide evidence that supports the two hypotheses (H1 and H2) (Table 3). Leadership seems to be an antecedent of entrepreneurial capital (H1), with a significant path (0.547,  $p < 0.01$ ). Entrepreneurial capital has a direct influence on innovation performance (H2), with a significant effect (0.452,  $p < 0.01$ ). The model shows a large  $f^2$  (effect sized) for H1 and H2 (Cohen, 2013). Regarding the moderating effects of firms' size and firm age, their paths have no significant influence on the model studied.

Table 3- Tests of Hypotheses

Hypotheses	$\beta$ coef.	p values	f <sup>2</sup>	Result
H1. L -> CE	0.547	0.000	0.428	Accepted
H2. CE -> INN	0.452	0.000	0.257	Accepted
Firm Size-> INN	0.111	0.121	0.014	
Firm Age-> INN	-0.025	0.724	0.001	

Source: Results of this study

The proportion of variability explained by the model is evaluated with the adjusted-R<sup>2</sup> values (Henseler et al., 2016), and is possible to conclude that the model of study explains 29,6% of entrepreneurial capital and 21,7% of innovation performance. (Table 4).

Table 4- Adjusted R<sup>2</sup> values

Construct	Adjusted R <sup>2</sup>
EC. Entrepreneurial capital	0.296
INN. Innovation Performance	0.217

## 5 Conclusions

The present study found that leadership is a key source for boosting entrepreneurial capital for high-tech SMEs. This brings valuable information for managers by identifying vital importance of leadership on entrepreneurial capital, being an effective predictor. CEO's influence on developing entrepreneurial capital by encouraging a shared vision and inspiring employees, allows creation of new knowledge and risk taking.

The research provides evidence that entrepreneurial capital has a positively and direct impact on innovation performance. These findings contribute to a better understating on how the entrepreneurial behaviours of employees drive innovation.

In a scenario of uncertainty and crisis, it is vital that the members of an organization create new knowledge and turn it into value for the company in order to maintain a competitive advantage. Mainly for SMEs, which depend on adapting to changes on the environment and innovation to survive, making it particularly important in emerging countries. (North & Varvakis, 2016).

The main contribution of this study is that explores the relationship between entrepreneurial capital , CEOs leadership and the innovation performance of technology-based small and medium enterprises (SMEs) on an emerging economy filling a gap on literature on this matter. Future research could explore this relationship from a different perspective such as a different environmental context, to broaden the research area. In addition, future studies are suggested to explore the interaction between leadership and others components of intellectual capital, to have a more comprehensive understating on this interaction.

## Appendix

Table A1– Scale Items

Construct	Indicator	Item
Entrepreneurial capital Based on Inkinen,Kianto, Vanhala,&Ritala	CE1	Risk-taking is regarded as a positive personal quality in our company.
	CE2	Our employees take deliberate risks related to new ideas.
	CE3	Our employees are excellent at identifying new business opportunities
	CE4	Our employees show initiative.
	CE5	The operations of our company are defined by independence and freedom in performing duties
	CE6	Our employees have the courage to make bold and difficult decisions.
Innovation Performance Based on Weerawardena	INN1	Compared to our competitors, our company has been successful in creating innovations in Products and services for customers.
	INN2	Compared to our competitors, our company has been successful in creating innovations in Production methods and processes
	INN3	Compared to our competitors, our company has been successful in creating innovations in Management practices
	INN4	Compared to our competitors, our company has been successful in creating innovations in Marketing practices
	INN5	Compared to our competitors, our company has been successful in creating innovations in Business models

Leadership Based on Khalili	L1	Leaders create and express an exciting vision of the future.
	L2	Leaders create and express an exciting vision of the future.
	L3	Leaders make the vision clearly understood by giving examples, telling stories, and using figures of speech and metaphors.
	L4	Leaders have visions/dreams of what can be.
	L5	Leaders have a clear image of the future.
	L6	Leaders express enthusiasm for their vision.
	L7	Leaders are models of what they want others to do.
	L8	Leaders use the vision to give the life and work of the company a sense of meaning and purpose.

### Abstract

In recent years, the concept of Intellectual Capital (IC) has acquired a crucial role in the university context. This because universities are characterized by a high intensity of adoption of intangible resources. Numerous studies have focused on IC performance reporting models, especially in the organizational context. Fewer studies, however, have considered the measurement of IC of universities. This paper aims to analyze the existing literature and identify the main metrics adopted for measuring IC in universities. To achieve this aim, we perform a systematic literature review of a sample of 71 articles and define a taxonomy of indicators of IC. The findings of this study highlight and categorize the main IC metrics and identify future research directions.

**Keywords** - intellectual capital, university, relational capital, structural capital, human capital.

**Paper type** - Academic Research Paper

## 1 Introduction

The relevance of Intellectual Capital (IC) has emerged mainly in the private sector, but, nowadays, there is a growing interest in this topic also in the public sector. The IC is a valuable strategic management asset to gain a competitive advantage. The IC offers managers a better understanding of the internal and external issues that arise in the organization (Tayles, Pike, & Sofian, 2007). In this regard, previous researchers highlighted how IC could help develop a learning culture that transforms traditional organizations into dynamic learning organizations (Ankur & Rajat, 2019; Secundo, Elia, & Passiante, 2010). Among public companies, the role of higher education and research institutions has major relevance for the economy of countries and regions as it has a considerable weight in terms of an educated workforce and greater entrepreneurship within the country. However, the importance of IC in higher education institutions is rarely discussed when evaluating the results in terms of cost and efficiency.

Today, university systems are immersed in an intense transformation process triggered by the need to make universities more flexible, transparent, competitive, and comparable (Sánchez, Elena, & Castrillo, 2009). To meet these challenges, higher education institutions must consciously manage the processes of creating their IC elements and recognize the importance of their role in society and the value they can create. Knowledge resources are the foundation of the core competencies of any organization. Therefore, they play a key strategic role and must be measured in a clear and detailed way using ad hoc metrics. The universities that adopt a strategic approach to manage the intellectual components have the opportunity to improve their reputation. However, to date, no study uniquely identifies and categorise the metrics used to enhance IC in universities.

This paper aims to define a taxonomy of indicators for the measurement and management of IC within universities. This taxonomy stands as a useful tool for developing culture, identifying activities aimed at knowledge management, and providing a useful contribution to the growing demand for transparency. To this end, we carried out a systematic review of the literature about IC in university to better understand the research directions currently explored. In particular, two research questions guided the drafting of this paper, consisting of:

- R1: how have the studies related to IC reporting evolved in the university context?

- R2: what are the main indexes in valuing IC in universities?

In answering these questions, this paper contributes to the research on IC in the university by conducting a systematic review on the topic and discussing the potential support and theoretical and managerial implications of IC reporting in universities. The remainder of the paper is organized as follows. In section 2, we present a brief overview of the topic of IC. The third section presents the methodology adopted to analyse the extant literature. Section 4 discusses the obtained result and, finally, section 5 outlines the gaps, future research avenues, and limitations.

## **2 Theoretical background**

The transition from the industrial society to the information-based, and subsequently, to the knowledge-based has already been anticipated by Drucker in the late 1990s. He stated that the emerging social context would rely on new organizational structures, focusing on knowledge as the main resource. Knowledge, developed in a tacit or explicit form, represents the basic concept of IC. Statistics relating to the most developed countries show a Gross Domestic Product (GDP) made up of about 50% from knowledge-based industries (software, pharmaceutical industry, information technology, education and research). In the United States, over 80% of GDP comes from this production sector and the various Research and Development (R&D) centres of manufacturing industries (Niebel, 2018). The difficulty in defining and understanding the IC scope limits the opportunity to describe it in a single research area. Despite the many attempts of researchers to define IC, there is still no univocal definition of this concept. Stewart (1997) defines IC as an intellectual tool for developing knowledge, information and intellectual property useful for supporting the creation of wealth and social development. Brătianu (2006) considers IC as an element capable of strengthening the intellectual components and transforming them during technological and administrative processes into operational, active and value-adding constructs. Numerous different classifications identify the components of IC (Bontis, 2001). Most of them are very similar in terms of decision-making aspects. Indeed, previous contributions focus on aspects related to the human, organizational (structural or internal) and relational components (Andriessen, 2004; Roos and Piche, 2007). Specifically, IC is

structured in three main components: Human Capital (HC), Relational Capital (RC), and Structural Capital (SC).

HC represents tacit knowledge, skills acquired by employees throughout their entire career, experience and attitude (Fanea-Ivanovici, 2013). SC considers aspects related to the different organizational structures, the patents and trademarks and all the other capabilities that favour the improvement of the productivity of employees (Edvinsson, 1997). Finally, RC incorporates the value generated in the development of relationships between the organization and its stakeholders: suppliers, partners, national bodies, and the business environment (Roos and Piche, 2007).

Given this background, universities and research institutes began to show interest in the management of the IC. Indeed, the implementation of IC reporting models within universities is a useful tool to support the growth and dissemination of knowledge. In dynamic contexts like university ones, the development of these models requires a considerable number of resources to generate organizational benefits. Although previous contributions illustrate methods for the analysis of IC (e.g., Sanchez, 2009; Leitner, 2002), to date there is still no study that reviews the main metrics used for measuring IC of universities. This paper aims to fill this gap by analysing the extant literature and defining a taxonomy of the metrics adopted to measure IC in universities.

### **3 Methodology**

The proposed literature review focuses on analysing the importance of IC within higher education and research institutions as a fundamental tool to generate knowledge. Specifically, the review was performed using a systematic approach adapted by Seuring et al. (2005). The methodology is structured in the following phases:

1. *material collection*: identification of the keywords, definition of the search strings, and selection of the database;
2. *material selection*: definition of exclusion criteria;
3. *descriptive analysis*: examination of the articles according to specific dimensions of analysis to highlight specific characters about the IC in universities;
4. *content analysis*: review the selected sample of papers to identify and group the main metrics adopted to measure IC in universities.

### 3.1 Material collection

This phase involves the search and selection of the articles using a database. We have chosen the Scopus database as it is considered the most reliable and high-quality data source for conducting literature reviews (Ahi and Searcy, 2013; Eskandarpour et al., 2015). The next step deals with the definition of the search string. Table 1 shows the search string and the total number of articles collected (288). In line with Denyer and Tranfield (2009), conference proceedings and book chapters were excluded from the hits to ensure the quality of the analysed papers. Indeed, only peer-reviewed publications were included in the final sample. Furthermore, no filters have been included to reduce the data range considered. The data collection phase was conducted in January 2021.

Table 1 Search string

<i>Search String</i>	<i>Papers</i>
(( ( intellectual AND capital ) OR ( intangible AND ( assets OR resources ) ) ) AND ( university OR higher AND education ) )	288

### 3.2 Material selection

This step is based on the selection of papers according to two exclusion criteria. First, we read the title and abstract of the articles. Indeed, the articles incongruent with the topic under investigation and those more polarized towards a theme and not on the link between IC and universities were excluded. Thus, following the first criterion, 122 documents were excluded from the sample. The second criterion is based on the full-text reading. In the case of unclear abstract, the entire paper was read to better view the aspects covered. Therefore, the systematic literature review was based on a sample consisting of 71 documents, as illustrated in Table 2.

Table 2 Exclusion criteria

<i>Exclusion criteria</i>	<i>Papers excluded (-)</i>
Initial sample retrieved	<b>288</b>
<b>1. Title and abstract reading</b>	-122
<b>2. Full-text reading</b>	- 95
Final sample	<b>71</b>

### **3.3 Descriptive analysis**

Once the collection of the sample was completed, we conducted the descriptive analysis to evaluate the formal aspects of the collected material. More in detail, this analysis allows us to characterize the context and support the results presented in the content analysis. The sample was analysed according to various dimensions listed below:

- distribution of articles per year of publication and number of citations;
- distribution of articles per document type;
- distribution of citations per journal.

#### *Distribution of articles per year of publication and number of citations*

Figure 1 depicts the evolution of articles over time, considering the year of publication. The results show that the 71 articles collected in the previous step were published between 1997 and 2020. The first article on the link between IC and universities in our sample was published in 1997 by Kinsella and McBrierty. Only eight articles were published between 1998 and 2011, and the highest number of articles published on the topic (13) was recorded in 2020. In the last few years, the authors have shown a growing interest in deepening the areas related to IC, thus enriching the academic literature and generating documents useful for defining the context and modelling structures aimed at evaluating IC in universities.

As for the number of citations received, there are four peaks in 2004, 2010, 2015 and 2018. In particular, the most cited article is the one by Leitner (2004) with 88 citations.

Figure 1 Papers per year of publication and number of citations

### 3.3.1 Distribution of articles per document type

Figure 2 shows the number of publications by document type. Specifically, 97% of the material collected consists of articles (69 papers out of 71), while the remainder consisted of reviews. This trend shows, as anticipated in the previous paragraphs, the scarcity of review papers that summarize the existing literature. In particular, the most recent review dates back to 2018 (Bisogno et al., 2018) and proposes a state of the art of IC in the university. With this aim, this study identifies and characterizes the main metrics adopted by the previous authors in measuring the IC of universities.

Figure 2 Articles per document type

### 3.3.2 Distribution of articles per journal

Figure 3 presents the distribution of articles by journals. The 71 articles of the sample were published by 51 different journals. This data is very significant since only the *Journal of Intellectual Capital* has published as many as 14 articles, followed by the *International Journal of Learning and Intellectual Capital*, with 3 articles, *Quality and Quantity*, *Studies in Higher Education*, *International Journal of Environmental Science Education*, *Knowledge Management Research*, *Industry and Higher Education* and *Practice* contribute with two articles each. The contribution of other journals is lower than 2%. Figure 3 highlights the heterogeneity of the theme under investigation. In that, the journals embrace different fields from entrepreneurship to the service industry.

Figure 3 Articles per journal

### **3.4 Content analysis**

The analysis of the selected material allows us to highlight the main metrics adopted to measure IC in the university context. Specifically, we group the metrics according to IC components (HC; SC; RC) and identify performance metrics of universities. The following sections will present in detail the classifications for each IC component and the IC performance.

#### **3.4.1 Human capital**

The HC represents the tacit and individual strategic source that contributes to creating competitive advantage and supporting its sustainability (Carmeli, 2004). Furthermore, the HC is a significant factor determining growth across countries (Ang et al., 2011; Banerjee and Roy, 2014; Barro, 1991; Goldin, 2001). Numerous studies have demonstrated the positive effect of HC on organizational performance (Carmeli, 2004; Hsu, 2008). In the context of universities, Teodorescu (2006) stated that researchers play the most important role in the generation, management and transfer of knowledge within universities and research institutes. Nguyen (2016), in a recent study, went further, proposing policies aimed at the management of human resources based on effective research in universities to motivate institutes to improve their performance in research. Townsend et al. (2015) explored the structural policies needed to promote research efforts. On the contrary, Chang et al. (2015) took a different perspective by advocating a balance between teaching and research to achieve excellence. These studies overlooked the role that the HC plays in stimulating university performance by converting the skills of an institutional researcher into knowledge, motivation into better research and interdisciplinary research on results, thus achieving the goal of excellence. Another set of studies was developed in the context of research universities and their contribution to the knowledge economy concerning developing countries (Altbach, 2013; Postiglione and Arimoto, 2015; Postiglione, 2013; Shin and Lee, 2015). These studies focus on globalization and internationalization through academic productivity, innovation and quality research, but neglect the role of the HC generated in the entire process. Table 3 presents the metrics adopted in measuring HC by the selected articles. These metrics have been divided into three groups: employees features, full-time and part-time employees. The first area includes metrics related to specific characters of university personnel. The second and third group consider

indicators that differentiate employees based on the type of contract with the university.

Table 3 Human capital metrics

	Components	Metrics	References
Human Capital	Employees features	Average years of experience of research staff	Kulikova et al. (2019)
		Average age of staff (professors, researchers, and administrative staff)	Kulikova et al. (2019), Kinsella et al. (1997)
		Academic and teaching staff (ATS) with a master's degree	Pedro et al. (2019), Kulikova et al. (2019)
		Gender of staff (professors, researchers, and administrative staff)	Stukalova et al. (2016)
	Full-time employees	Percentage of teaching, technical and auxiliary staff	Iacoviello et al. (2019)
		Number of administrative staff members	Iacoviello et al. (2019)
		Number of associate professors	Iacoviello et al. (2019), Pedro et al. (2019), Ramírez Y. et al. (2017), Feng et al. (2012), Renzl (2006)
		Number of full professors	Iacoviello et al. (2019), Pedro et al. (2019), Ramírez Y. et al. (2017), Feng et al. (2012), Secundo et al. (2010)
	Part-time employees	Number of part-time research contracts	Ramírez et al. (2017), Secundo et al. (2010)
		Number of teaching assistants	Iacoviello et al. (2019)
		Number of PhD students	Ramírez et al. (2017), Manes Rossi et al. (2018)
		Number of research collaborators	Sánchez et al. (2009)
		Number of researchers involved in the research activities	Sánchez et al. (2009), Secundo et al. (2010)
		Number of research assistants	Sánchez et al. (2009)
		Number of student assistants	Iacoviello et al. (2019), Kulikova et al. (2019), Leitner (2004)

### 3.4.2 Structural capital

The SC can contribute to organizational sustainability practices through the implementation of support and improvement programs, such as structural improvements based on new technologies (databases and forms of intellectual property); knowledge sharing practices; organizational processes and tools that

transform individual knowledge into organizational assets and corporate culture (Tonial et al., 2019). Concerning SC, the importance of creating and managing specific mechanisms of know-how and knowledge flows within ecosystems is essential for developing employees skills (Borin and Donato, 2015). As for the HC, the SC is also classified into sub-categories. Table 4 presents the three different groups of metrics identified. Specifically, the three groups refer to the different investments made by universities, respectively for the staff, technological infrastructures and R&D activities.

Table 4 Structural capital metrics

	Components	Metrics	References
Structural Capital	Employees	Total expenditure on staff in relation to total expenditure	Pedro et al. (2018), Leitner (2004)
		Number of research infrastructures/incubators and laboratories	Stukalova et al. (2016)
		Lump-sum for research (government funding and non-government funding) / total research funding	Sánchez et al. (2009)
		Amount of budget constraints (cost of staff equipment + personnel) / research	Sánchez et al. (2009)
	Technologies	Number of investments in libraries and electronic material	Leitner (2004), Manes Rossi et al. (2018), Feng et al. (2012), Kulikova et al. (2019)
		Total expenditure on IT and communication in relation to total expenditure	Pedro et al. (2018)
		Number of technical services performed and revenues from those services	Gardner. et al. (2010)
		IT and communication spending	Pedro et al. (2019)
		Number of PCs for faculty members	Secundo et al. (2010)
		Number of PCs per staff member	Secundo et al. (2010)
		Number of PCs per student	Secundo et al. (2010)

	IT costs spent on staff	Secundo et al. (2010)
	Fee for leasing of premises and equipment	Leitner (2004)
R&D	Share of the budget related to knowledge transfer by origin	Gardner. et al. (2010)
	Thresholds imposed on fundraising (including the weight of university contributions on the total budget and incentives given to private donors to support research activities)	Sánchez et al. (2009)
	Non-core funding /total budget and budget for research.	Sánchez et al. (2009)
	Non-institutional funds (contract research, etc.)	Secundo et al. (2014), Sánchez et al. (2009)
	R&D expenses	Ramírez et al. (2017), Feng et al. (2012), Gardner. et al. (2010), Kulikova et al. (2019), Sánchez et al. (2009)
	Expenses for advertising and market research	Pedro et al. (2018)
	Total expenditure on scientific journals in relation to total R&D expenditure	Pedro et al. (2018)
	Total funding for third parties (public and private) for R&D in relation to total financing	Pedro et al. (2018)

### 3.4.3 Relational capital

The RC focuses on the relationship between universities and external partners, which has acquired a central role due to the investments made by universities to increase their social capital and the development and dissemination of digital media. These initiatives facilitated the creation of networks between universities, industries and local communities, and university-university. In line with this point of view, we group RC metrics based on two different types of partnership:

academics and industry. Table 5 shows in detail the RC metrics adopted by selected papers. Metrics related to university-university relations focus mainly on international exchanges. The metrics related to the industrial area, on the other hand, refer to collaborations and projects carried out with industries.

Table 5 Relational capital metrics

	Components	Metrics	References
<b>Relational Capital</b>	Academia	Level of internationalization of the teaching staff	Manes Rossi et al. (2018), Leitner (2004), Secundo et al. (2010), Pedro et al. (2019), Kulikova et al. (2019), Ramírez et al. (2017)
		Number of students with international experience (undergraduate, master and doctorate) and on postgraduate programs	Pedro et al. (2019), Secundo et al. (2010)
		Number of faculty members in international conferences	Secundo et al. (2010)
		Number of international conferences visited	Leitner (2004)
		Percentage of international students	Secundo et al. (2010), Kulikova et al. (2019)
		Duration of stay for international researchers from other universities (months)	Leitner (2004)
		Research grants abroad	Leitner (2004)
		Number of international affiliations with education/research institutions	Secundo et al. (2010), Secundo et al. (2014), Kulikova et al. (2019), Stukalova et al. (2016), Pedro et al. (2019)
		Number of agreements signed with foreign educational organizations	Pedro et al. (2019)
		International student mobility level	Kulikova et al. (2019)
		Rate of foreign university students in postgraduate programs	Manes Rossi et al. (2018)
		Number of events to attract foreign students	Kulikova et al. (2019), Manes Rossi et al. (2018)
		Number of European and international collaborative research projects	Kulikova et al. (2019)
		Number of foreign language courses offered	Manes Rossi et al. (2018)
		Number of teachers abroad	Iacoviello et al. (2019), Kulikova et al. (2019)
		Number of courses in English	Iacoviello et al. (2019)
		Number of government institutions involved in research and education	Leitner (2004)

	activities	
Industry	Number of international companies involved in research and education	Secundo et al. (2014)
	Number of students participating in orientation	Secundo et al. (2014)
	Number of internships/stages foreseen for students	Iacoviello et al. (2019)
	Percentage of interns, speakers sent in learning programs	Iacoviello et al. (2019)
	Number of contracts with industry (by sector and by competitive/non-competitive classification)	Ramírez et al. (2017)
	Relations with the company (number of positions held within the management / governance / civic participation / consultancy / accreditation / social or specialist forums for negotiation and / or discussion)	Sánchez et al. (2009)
	Total n. existing contracts / agreements for cooperation / protocols (teaching / research) with public and private, national and international organizations	Pedro et al. (2019)
	The number of university-industry cooperation	Pedro et al. (2019)
	Number of events organized (career days, workshops)	Feng et al. (2012), Iacoviello et al. (2019)

#### 3.4.4 Performance

The measurement of university performance represents a rather complex issue, given its immaterial nature. This is one of the most critical aspects of university management. As knowledge is difficult to measure, researchers sought to identify appropriate metrics and indicators, mostly based on the results of activities generated by knowledge and its dissemination. Indeed, we group indicators according to four different components. The first focuses on the creation of knowledge through the generation and exploitation of patents and licenses. The second considers indicators capable of enhancing the scientific production of universities. The third is linked to the third mission. Finally, the last group considers the didactic scope. Table 6 shows the metrics collected in detail.

Table 6 IC performance metrics

	Components	Metrics	References
<b>Performance</b>	Intellectual property	Number of technology licenses	Feng et al. (2012)
		Income generated from licenses	Leitner (2004), Feng et al. (2012)
		Number of patents developed	Secundo et al. (2010), Ramírez et al. (2017), Feng et al. (2012), Iacoviello et al. (2019), Sánchez et al. (2009), Kulikova et al. (2019), Kinsella et al. (1997), Manes Rossi et al. (2018)
		Number of active patents owned by the university (by sector)	Sánchez et al. (2009)
		Number of patents incorporated in the new products/solutions developed	Secundo et al. (2014)
		Number of national patents obtained	Kulikova et al. (2019)
		Number of patent applications submitted	Secundo et al. (2014), Wu et al. (2012), Chen et al. (2013)
		Number of patent extensions submitted	Secundo et al. (2014)
		Number of licenses/options executed within the year based on know-how only	Gardner. et al. (2010)
		Number of pilot applications developed	Secundo et al. (2010)
	Scientific research	Number of publications of scientific articles in international scientific journals	Kulikova et al. (2019), Secundo et al. (2010)
		Number of scientific/didactic publications	Ramírez et al. (2017), Manes Rossi et al. (2018), Feng et al. (2012), Leitner (2004), Pedro et al. (2019)
		Number of research published by the faculties	Wu et al. (2012), Chen et al. (2013)

	Number of publications in diaries	Renzl (2006), Sánchez et al. (2009)
	Number of publications in newspapers	Renzl (2006), Leitner (2004), Sánchez et al. (2009)
	Total number of citations and publications by discipline/university publications.	Sánchez et al. (2009)
	Number of co-publications per sector	Sánchez et al. (2009)
	Number of books published	Iacoviello et al. (2019)
	Scientific awards	Renzl (2006)
Third mission	Number of people hired by the newly generated company	Secundo et al. (2014)
	Total number of new local partners	Secundo et al. (2014), Kinsella et al. (1997)
	Number of people employed by the interested parties involved	Secundo et al. (2014)
	Number of start-ups implemented	Kulikova et al. (2019), Pedro et Al. (2018), Secundo et al. (2014)
	Number of spin-offs	Secundo et al. (2010), Secundo et al. (2014), Leitner (2004), Manes Rossi et al. (2018)
	Total number of new jobs created	Secundo et al. (2014), Kinsella et al. (1997)
	Number of spin-offs funded by the university and percentage higher than the total number of spin-offs (funded + supported).	Sánchez et al. (2009)
	Number of university-backed spin-offs.	Sánchez et al. (2009)
	Number of spin-offs that have ceased operation	Gardner et al. (2010)
	Number of spin-offs that have carried out a capital increase during the year	Gardner. et al. (2010)
	Number of employees acquired by spin-offs	Leitner (2004)

	Number of research projects in progress	Secundo et al. (2010)
	Number of projects marketed	Kulikova et al. (2019), Manes Rossi et al. (2018)
	Time until the first job	Ramírez et al. (2017)
	Graduates' employment rate	Ramírez et al. (2017)
Didactics	Number of doctoral courses with official mention of quality	Pedro et al. (2019), Ramírez et al. (2017)
	Share of educational programs accredited in national and international agencies	Kulikova et al. (2019)
	Number of new students accepted in the current academic year	Pedro et al. (2019), Secundo et al. (2010)
	Number of student complaints	Pedro et al. (2019), Secundo et al. (2010)
	Number of teaching hours provided	Iacoviello et al. (2019), Secundo et al. (2010)
	Student attendance at lessons (number of hours taught / total number of lesson hours)	Iacoviello et al. (2019), Secundo et al. (2010)
	Number of speeches made per lesson (interactive participation)	Iacoviello et al. (2019)
	Average grades for students enrolled in the exam	Iacoviello et al. (2019)
	Number of hours of thesis supervision provided for students	Iacoviello et al. (2019)
	% Of graduates (undergraduate, master and doctorate)	Iacoviello et al. (2019), Ramírez et al. (2017), Pedro et al. (2019)
	Average time for graduation	Iacoviello et al. (2019), Ramírez et al. (2017)
	Number of participating students out of the total number of students enrolled	Iacoviello et al. (2019), Secundo et al. (2010)
	Number of exams passed / total number of exams /	Iacoviello et al. (2019)
	Number of students attending exam sessions in a	Iacoviello et al. (2019)

year / total number of students enrolled in the course

Number of reports received by students	Iacoviello et al. (2019)
--	--------------------------

Number of students who reconfirm their enrolment at the university for the year following the year in which they received orientation activities	Iacoviello et al. (2019)
--	--------------------------

Image/opinion/reputation of higher education institutions (society, media, among others) at regional, national and international level	Pedro et al. (2019)
--	---------------------

Student satisfaction	Pedro et al. (2019), Manes Rossi F. et al. (2018), Secundo et al. (2010)
----------------------	---

Number of seminars organized and attendance	Iacoviello et al. (2019)
---	--------------------------

## 4 Discussion

The content analysis has highlighted the main elements that influence the development of the IC components in universities. Metrics were grouped according to IC components and performance. First, the HC indicators assess the organic structure of the university, distinguishing full-time and part-time employees. This distinction makes it possible to assess the degree of turnover and expertise of the university's personnel. Moreover, HC indicators refer to employees' characteristics (e.g., age, gender, year of experience). Second, as for the organizational component, the SC indicators deal with investment aspects for staff and technological infrastructures. In this way, it is possible to highlight the strategy pursued by the universities indirectly. Furthermore, the SC metrics allow the university managers to obtain useful information to support future decisions related to the implementation of structural improvement actions. Third, the RC metrics aim to analyse the degree of internationalization of universities and the link with the local community and industry.

Moreover, the classification identified the performance metrics of the universities. We categorize the metrics into four different areas. The first area shows the aspects related to the codification of knowledge through intellectual property. The main metrics concern the creation, and subsequently, the use of patents and licenses, the result of research actions developed to obtain added value compared to competing universities. These indicators quantify the outputs generated by those activities that mainly use intangible resources complex to measure. The second group of indicators is defined as innovation and codification of knowledge through scientific research. In particular, this classification includes a set of indicators that analyze and show the extent of the work of universities in terms of scientific research. A considerable part of the metrics refers to aspects related purely to the publications. Third, we have grouped performance indicators related to the third mission. This classification introduces metrics such as the number of new partners, spin-offs, and jobs created. These indicators are essential for evaluating the third mission of universities and, therefore the social contribution of the university to the environment in which it operates. Finally, the last category of IC performance indicators refers to didactic. The quality of teaching is assessed through student satisfaction metrics and course enrollment rates.

The conducted analysis reveals the need to integrate quantitative and qualitative indicators to provide a complete set of information about the IC and the methods implemented for its development. The proposed taxonomy represents a first attempt to reorganize the knowledge that emerged from the analysis of the content providing a potential answer to the research question R2. More in detail, 116 indicators have been identified. The trend in recent years is to identify indicators linked above all to didactics performance. In addition, the researchers focused on indicators that assess the incidence of links with international bodies. These trends are not surprising. In that, universities tend to measure the quality of didactics to increase the number of students through improvement actions, events, and investments in digitalization. In this sense, didactics represents the driving force of the overall performance. On the other hand, the need to assess the degree of internationalization is due to the importance that this aspect is acquiring in the university in the last few years. Indeed, a good level of internationalization, in addition to allowing the attraction of students, improves research performance and the capability to obtain funding. Another interesting aspect is related to the third mission of the universities. This

sphere is often neglected in measurement. In this perspective, if it is easy to analyse the graduates hiring rate and the number of spin-offs created, it is difficult to assess the effective continuity of these last, and even more difficult to assess the degree of dissemination of the sustainable culture in the local community. Thus, universities must spread a sustainable culture not only social but also environmental and digital. In this sense, the pandemic has highlighted the importance for universities of being flexible and able to facilitate the transition of the actors involved towards the digital paradigm.

## **5 Conclusions and future research directions**

In recent years, the topic of IC measurement in university contexts has acquired considerable importance. Given the scarce number of reviews in this area, the need to analyze and classify the existing literature arose. This paper attempts to fill this gap by performing a systematic literature review relating to IC management in universities. This review aims to understand the research directions currently being explored. In particular, two research questions were identified. The descriptive analysis allows us to answer question R1, highlighting how the academic literature on IC has evolved. In particular, there is a positive trend in the number of articles published. Besides, the descriptive analysis highlighted that most of the documents are articles. This suggests the call for more review papers focused on the management of IC in universities. Moreover, we were able to observe that studies on IC embrace a wide range of subject areas from technological to humanistic fields. This emphasizes the centrality of IC measurement, as, in recent years, universities have been called to generate performance and activities reporting models with stringent transparency requirements. Subsequently, through a careful analysis of the content, it was possible to reorganize the literature according to the main metrics adopted for IC measurement. The indicators for the three IC components (HC, SC, RC) and performance were thus analysed and described. These indexes were grouped based on specific characteristics to identify a taxonomy of IC metrics. The latter represents an important contribution in answering the research question R2. The taxonomy underlines the wide possibilities of implementing report models within universities and showing the importance of analysing, in detail, the information generated by the indicators. The analysis revealed a predominance of indicators for assessing the performance of universities, especially in the didactic sphere.

This result highlights how teaching is a driving aspect that also influences the performance of other areas such as the third mission. Indeed, the third mission indicators are strongly correlated to the didactics performance, such as the total number of new jobs created and the employment rate of graduates. The area characterized by a smaller number of indicators, on the other hand, is represented by the HC. This could be due to the difficulty of measuring the human component of universities. As for practical implications, the main advantage of implementing an IC evaluation system, based on the metrics included in the taxonomy, is to facilitate accountability towards different stakeholders and monitor intangible inputs and outputs. In that, the taxonomy can serve as a tool for measuring and evaluating IC and its productive use in universities. The categorization represents a global approach, which simultaneously addresses the need for transparent communication to external stakeholders and internal management of resources. Besides, the use of these metrics allows universities to evaluate organizational and research activities. On the other hand, since the objectives defined by the universities are distinct and disparate, it is difficult to create a standard to be applied in all areas. Therefore, we identified the following future research direction:

- recognize innovative methodologies for comparing data at the faculty or university level across different disciplines, such as engineering, medicine and art;
- define novel indicators to evaluate the dissemination of environmental culture provided by universities;
- exploit the taxonomy to implement empirical models to analyse and compare the impact of each component of IC on university performance;
- investigate the methods of acquiring strategic and operational information used to define the mission and strategic objectives of universities;
- deepen the search for indicators used in organizational performance evaluation models of universities;
- analyse how the Industry 4.0 technologies impact on IC of universities;
- investigate the promotion of projects aimed at fostering the sharing of knowledge and the exchange of information between universities.

The main limitation of the study refers to the adopted methodology. Specifically, some relevant articles may be excluded from our sample due to the exclusion criteria, database, and keywords used.

### Abstract

In the current economic era, named the knowledge economy, it is considered that knowledge is the most critical tool to create products and services. Knowledge transfer forces a focus on the knowledge-based economy, where access to tangible resources alone does not provide a sustainable competitive advantage (Marr & Spender, 2004). There are methods to measure tangible assets in businesses, for instance, financial statements, but sometimes not all intangible assets, as shown in this research. However, managing intangible assets has become crucial in businesses because it supports decision-making, innovation, and formulation of strategies for higher performance (Marr et al., 2004), in today's fast-changing environments that include technological developments (Chen & Zhu, 2004). Therefore, the primary source of value creation reduces tangible assets or structural capital, and intangible assets become a more reliable source (Carson et

al., 2004). Intellectual Capital (IC) is vital because it is a fundamental factor for generating and transferring knowledge, improved productivity and efficiency, and excellent business value.

This research aims to analyze the correlation of IC on business performance. This research answers the question 'do IC in firms spur its performance? The proposed research methodology is an analysis of multiple correlations. In the results, it is provided that the level of relationship between IC and business performance. In this research methodology, we applied a survey to 142 business in the services, commercial and industrial sectors. The survey measured the human, structural, and relational capitals and the financial, market, and operative performance. The results present that IC contributes 30.5% to economic performance, 36.2% to market performance, 46.3% to operational performance and 51% to total performance.

To conclude, it was possible to identify that the IC may have some variations in human, structural and relational means, all influencing business performance. The greater the IC, the greater the effect on performance. However, IC must be correctly identified to create an organisation's operational plan that improves financial, functional, and market performance. Still, developing strategic plans to make a one-of-a-kind company creates a more excellent value in the organisation. IC is not repetitive between organisations, not even in the same sector or specific situation. Still, it can be a great support to create a unique, solid, and irreplaceable company, depending on the organisation. Knowledge management is, therefore, a necessity. The development of organisational knowledge is the task and challenge of current administrators. Thus, this research provides a tool to identify businesses' IC for performance improvement.

## 1 Introduction

Global economic growth has changed since 1970 with the rapid and dizzying development of technology (Chen & Zhu, 2004). Now, society is distinguished by a constant change based on knowledge (Smart et al., 2003) and knowledge management. Therefore, the organisation focuses on having Intellectual Capital (IC) as a critical organisational asset (Bose & Oh, 2004) fundamental economic resource. Furthermore, the organisations now have a fast pace of work due to global competition. Facing this competition and dynamic environments to gain access to new markets and technologies has led organisations to have diverse talents and use their expertise towards achieving organisational goals (Bhatt, 2002). Therefore, organisations seek to generate a competitive advantage, and for

this, they strive to codify knowledge and develop their structural capital (equipment, programs, databases, organisational structure, patents, trademarks). Additionally, the business environment has changed because consumers are better informed and more demanding.

Furthermore, commercial borders have been fading because of increased collaboration between organisations and expanding the market in a competitive field. This situation forces a focus on a knowledge-based economy, where access to tangible resources alone does not provide a sustainable competitive advantage (Marr & Spender, 2004). Therefore, the primary source of value creation reduces tangible assets or structural capital, and that intangible assets become a more reliable source (Carson et al., 2004). In this sense, generating competitive advantage implies a tremendous challenge for organisations that must codify and externalise the tacit knowledge that exists in the minds of their employees (Bontis et al., 2000). It is also important to mention that effective knowledge management becomes a guide for the business philosophy that influences the strategies undertaken by managers in organisations (Darroch & Mcnaughton, 2002). In other words, a company obtains a competitive and sustainable margin if it knows what it knows, if it knows how to use that knowledge and how quickly it can learn something new (Viedma, 2001).

The knowledge economy from the post-industrial era and immediate communication mean that best practices are distributed in any direction and to anyone. Advances in education such as distance education and knowledge management, the Internet and email, make us think about the distribution of knowledge differently, thereby increasing the organisation's performance, maintaining, and capturing knowledge. There are two types of organisations in the world of knowledge-intensive organisations that produce information products and whose distinctive competence is collecting and transmitting financial information and knowledge-creating organisations dedicated to innovation: creativity and personalised delivery (Civi, 2000). And better defining people's potential abilities (Wiig, 2012).

Drawing collective creativity and employee know-how is emerging as one of the best ways to anticipate customer needs and create new markets (Bukowitz, 1997). Therefore, institutions should prioritise quality thinking, learning, and better use of knowledge (Coulson-thomas, 1997). IC's innovation capacity is enabled, making the difference in businesses and not cash (Bontis & Fitz-enz, 2002). IC's innovation capacity is boosted, making the difference in companies

and not money (Nick Bontis & Fitz-enz, 2002). IC is part of knowledge management (KM), as it is the knowledge created, integrated and shared by the firm (Nonaka & Teece, 2001), which enhances a sustainable performance in firms and creates distinctive competencies (Chaharbaghi & Cripps, 2006). Such competitive advantage is developed by combining resources that are valuable, rare and difficult to be replicated by others (Pike et al., 2005).

Therefore, it is time to carry out a program to obtain the existing knowledge in every organization in an orderly and systematic way. It is also critical to consider employees like partners instead of only a human resource or labour source. Thereby transform employees' experience, expertise, intellect, intuition, and ability into new knowledge available to the organization. Additionally, it is relevant to convert and change that -generally tacit- knowledge into explicit knowledge. The only sustainable advantage is what people know and what they do with such knowledge (Civi, 2000).

It is essential to consider that IC generates considerable competitive advantages for the organisation, so the organisation must identify all those internal elements that help it create value, improve its performance, and achieve its objectives. Of course, the organisation easily remember all those tangible assets that support it in achieving the above. Still, there are also intangible assets that are not always easy to identify in the organisation. In the same way, contribute enormously to achieving the objectives, sometimes in a more significant proportion than tangible assets. It is then necessary for the company to identify its intangible elements to develop them and increase its capacity to respond quickly to changes in the market and achieve and maintain a better position. Acknowledging all the intangible factors generating value allows the firm to develop, store, and make it remain in the organisation, focus on the relevant aspects, and set aside those elements that do not generate value even in the present or future. In addition, this identification will allow partners, workers, clients, and suppliers to obtain greater and greater benefits at different levels: financial, operational, and administrative, then focusing their efforts on those elements that generate value, that covers their needs, and that allows them to achieve goals.

## 2 Literature Review

As traditional production factors, land, labour and capital are no longer considered the most critical resources in the organisation. But businesses manage knowledge, information and experience, to adequately address IC, creating value in the organization since it cannot be transferred (Bontis, 1998). But managing knowledge, information and experience, to adequately manage IC and create value in the organisation since it cannot be transferred (Bontis, 1998). IC is defined as the knowledge that generates high-value assets, which can be considered the difference between the market value and the company's book value (Abeysekera, 2006). The intangibles assets are classifying into three parts: internal structure, external structure, and employee competence. Internal construction consists of patents, research and development models, and computer and administrative systems; outer frame consists of relationships with customers and suppliers, brands; and employee competence consists of individual education, skills, training, values, and experience (Karl Erik Sveiby, 2001).

IC is elusive but provides organisations with a new resource base to compete once discovered and exploited. Thereby generation of intangible assets such as intellectual property is based on people who have an infrastructure that allows them to merge into the company (Bontis, 1998). However, the Balance Sheet does not include current intangible assets that generate value in the organization. On the contrary, a Balance Sheet does not have intangible assets that create value in the organization. This gap is because modern accounting methods do not consider the organisation's employees' knowledge translation of such knowledge, thus creating a knowledge package (Nick Bontis, 1998b; Nick Bontis & Fitz-enz, 2002). This gap is because modern accounting methods do not consider the organisation's employees' knowledge translation of such knowledge, thus creating a knowledge package (Bontis & Fitz-enz, 2002).

There are different definitions of knowledge, and there is still no single and standard definition to define and classify IC (Marr et al., 2004). Nevertheless, several authors have studied and proposed these definitions over time, shown in

Table 7. Definitions of IC.

Author	Year	IC
Hall	(1992)	It can be classified as “active” (example, brand, contracts, database) or “skills” (example Know-how of employees, organisational culture)
Edvinsson & Sullivan,	(1996)	The knowledge that can be turned into value
Brooking	(1996)	It consists of four main components: Market Assets, Human-Centric Asset, Intellectual Property Assets, and Infrastructure Assets.
Sveivy	(1997)	It consists of three categories of intangible assets: internal structure, external structure, and human competence.
Roos et al	(1997)	It is composed of the thinking part, for example, human capital, and the non-thinking part, for example, structural capital
Stewart	(1997)	Intellectual Material that has been formalised, captured, and provides or produces a highly valued asset
Edvinsson y Malone	(1997)	It is the sum of human capital and structural capital. It involves applied experience, organisational technology, client relationships, and professional skills that provide an organisation with a competitive advantage.
Bontis et. al.	(1999)	It is the concept that classifies all intangible assets as well as their interconnections
Lev	(2001)	Origin of future benefits (value) which are generated by innovation, unique organisational designs, or human resource practices
Marr y Schiuma	(2001)	It is composed of knowledge-based assets, distinguished into three organisational actors (relationships, human resources) and infrastructure (virtual and physical)
EUFORUM	(1998)	Intangible assets are not recorded in accounting. Therefore, these are not shown in traditional financial statements. But generate value to the organisation related to human and structural capital; It is also a source of sustainable competitive advantage, fundamentally considering what the company knows and how it uses it. Finally, it is a capacity for constant learning.
Stewart	(1998)	It is the creation of value of intellectual material, knowledge, information, intellectual property, experience
Sanchez	(2008)	They are the intangible assets of the organisation.
Edvinsson & Malone	(1999)	It is the language that marks the organisational activities that generate future-benefits
Bradley	(1997)	It is the ability to transform knowledge and intangible assets that generate wealth in organisations and countries.
Stewart	(1991)	It is everything that cannot be touched, but that generates money for the organisation
Lev	2001	They are intangible resources that generate future financial benefits but do not have a physical or financial body

## 2.1 Intellectual Capital

The IC comprises human, relational and structural components. It stands out that each of the elements will generate competitive advantages over the organisation (Seetharaman, Lock Teng Low, & Saravanan, 2004). Figure 4 shows an alternative to classifying the IC as internal capital, external capital, and human capital (Boedker et al., 2005; Guthrie & Petty, 2000).

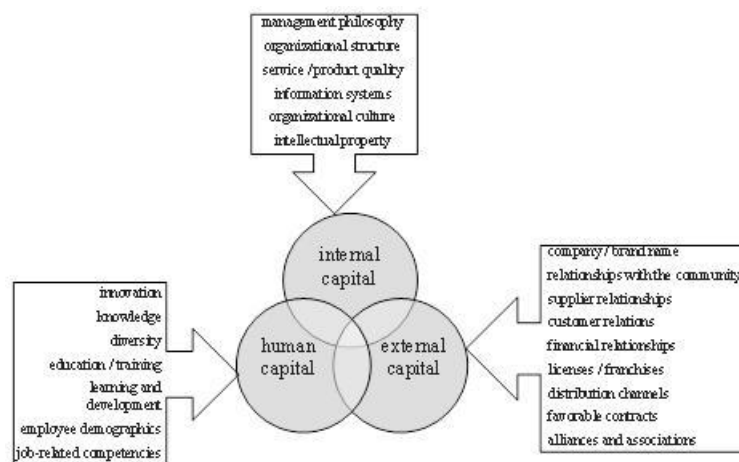

Figure 4. Tripartite model of Intellectual Capital (Boedker et al., 2005).

Three primary IC constructs have been identified human capital, structural capital, and relational capital (Bontis et al., 2000). Three primary IC constructs have been identified human capital, structural capital, and relational capital (Bontis et al., 2000). Next, we will explain the classifications based on the human, relational and structural dimensions.

### 2.1.1 Human Capital

IC includes human capital in which the human intellect stands out, found within employees (Bontis, 1998). The structural capital is integrated by the organisational routines and the client capital in which the market relationships are found. In essence, it is the knowledge rooted in external relations to the organisation. Thus, IC includes human capital in which the human intellect stands out, found within employees (Bontis, 1998). The structural capital is integrated by the organisational routines and the client capital in which the market relationships are found. In essence, it is the knowledge rooted in external relations to the organisation. Thus,

the first element of IC is human capital. Human capital is the individual knowledge stock of an organisation represented by employees. The employees generate IC through their competence, attitude, and intellectual agility. Competencies include skills and education, while perspectives cover the behaviour component of employees' work. Intellectual agility allows changing practices to think of innovative solutions to problems. Therefore, employees are considered the corporation's most crucial asset in a knowledge organization (Seetharaman et al., 2004).

Human capital is the collective capacity of the company to extract the best solutions from the knowledge of its individuals, all of this to improve personal skills or develop new ones (Bontis et al., 2000). Human capital is a source of innovation and strategic renewal, such as brainstorming in a research laboratory, office dreams, old files, process reengineering. It improves personnel skills and develops new leaders; human capital is limited to knowledge, and it is also the most challenging element of IC to codify (Nick Bontis, 1998a). Human capital is the collective capacity of the company to extract the best solutions from the knowledge of its individuals, all of this to improve personal skills or develop new ones (Nick Bontis et al., 2000). Human capital is a source of innovation and strategic renewal, such as brainstorming in a research laboratory, office dreams, old files, process reengineering. It improves personnel skills and develops new leaders; human capital is limited to knowledge, and it is also the most challenging element of IC to codify (Bontis, 1998).

Human capital combines genetic inheritance, education, experience, attitudes about life, and business. Therefore, it is a source of innovation and strategic renewal. Also, it is considered an intangible asset to create unique skills, tacit knowledge and awareness of what the client wants and internal processes. Also, human capital expresses employees' knowledge, talent, and experienced relates to the culture that can be managed if the organisation's members relatively without mobility (Bontis & Fitz-enz, 2002).

### *2.1.2 Structural Capital*

The second IC element is structural capital that includes what is not human from the knowledge warehouse in organisations like databases, flowcharts, process manuals, routines. Such knowledge is not worth more to the company than its value material, which belongs and stays with it when employees go home (Seetharaman et al., 2004). Structural capital is systems and procedures by which

organisations can follow their actions, allowing individuals to try to do things, learn to minimise costs, and maximise utility (Bontis, 1998). For example, structural capital is copyrights, trademarks, patents, internal databases, computer systems and intranet, managing knowledge (Seetharaman et al., 2004).

### *2.1.3 Relational capital*

The third element of IC is relational capital. It is the knowledge rooted in the marketing channels; and customer relationships that an organisation develops through business. It represents the potential that an organisation has due to the intangibles of the companies; generated by the relationship between employee satisfaction, customer satisfaction, customer loyalty and financial performance. It should be mentioned that it is considered the essence of knowledge rooted in external connections to the organisation, measured by the seniority of the staff (Bontis, 1998). (Nick Bontis, 1998a). The companies' external income derived from brands, reputations, strategic alliances, and relationships with clients and suppliers (Seetharaman et al., 2004).

## **3 Methodology**

The proposed research methodology is an analysis of multiple correlations. In the results, it is provided with the level of relationship between IC and business performance. In this research methodology, a survey was applied to 142 commercial, industrial, and service businesses. The survey measured the human, structural, and relational capitals and the financial, market, and operative performance. The research used a quantitative methodology to test the hypotheses. The inference is causal, taking the dependent and independent variables (Bernal, 2010). This research has four hypotheses:

*H1: Intellectual Capital has a positive impact on Financial Performance*

*H2: Intellectual Capital has a positive impact on Market Performance*

*H3: Intellectual Capital has a positive impact on Operational Performance*

*H4: Intellectual Capital has a positive impact on Total Performance*

The research is practice, non-experimental, and transactional to know the variables in the context (Hernández Sampieri et al., 2014), and the sample is non-probabilistic (Bernal, 2010). Finally, to process the data, the software SPSS was applied.

#### 4 Results

The questionnaire about IC and its relationship with organisational performance was applied through the Survey Monkey platform, with 141 responses for data collection. The detail of the sample is shown

Table 8.

Table 8. Sample details.

Variable	Item	%
Position	General manager	59%
Working time in the company	0-5 years working	81%
Gender	Men	56%
Scholarship	Graduate	83%
Business area	Manufacturing industry	82%
Size of the company	Big company	78%
Age of the company	More than 11 years	75%
Origin of capital	Foreign capital	66%

Cronbach's Alpha values were more significant than 0.8, demonstrating the validity of the model. Table 9 presents these values.

Table 9. Cronbach's Alpha analysis.

Variables	Cronbach's Alpha
Human capital	.885
Structural capital	.945
Relational capital	.942
IC	.969
Financial performance	.861
Market performance	.888
Operations performance	.914

In terms of hypothesis one: *IC affects financial performance*. Based on the regression analysis of the model presented in

Table 10, the variable that best explains financial performance is the relational capital and the human capital, with an R-squared of 30.5%.

Table 10. Summary of the model.

Model	R	R square	R square adjusted	Standard error estimation	Durbin-Watson
1	.523 <sup>a</sup>	.274	.269	.43342	
2	.562 <sup>b</sup>	.316	.305	.42234	1.910

a. Predictors: (Constant), relational capital

b. Predictors: (Constant), relational capital, human capital

c. Dependent variable: finance performance

In regards to hypothesis 2, stating: *the IC affects the market performance*. Table 11 shows that the variable that best explains market performance is the relational capital, and the human capital, with an R-squared of 36.20%.

Table 11. Summary of the model.

Model	R	R square	R square adjusted	Standard error estimation	Durbin-Watson
1	.606 <sup>a</sup>	.367	.362	.41918	
2	.660 <sup>b</sup>	.436	.428	.39709	1.843

a. Predictors: (Constant), human capital

b. Predictors: (Constant), structural capital,

c. Dependent variable: Market performance

Hypothesis three, defined as *IC, affects operational performance*. According to Table 12, the variable that best explains financial performance is the relational capital, and the human capital, with an R-squared of 46.3%.

Table 12. Summary of the model.

Model	R	R square	R square adjusted	Standard error estimation	Durbin-Watson
1	.640 <sup>a</sup>	.409	.405	.45109	
2	.686 <sup>b</sup>	.471	.463	.42830	2.131

a. Predictors: (Constant), Relational capital

b. Predictors: (Constant), Relational capital, human capital

c. Dependent variable: Operational performance

The model in Table 13 demonstrates that the variables that best explain financial performance are relational capital and human capital, with an R-squared of 51%; relating to hypothesis four, *IC affects total performance*.

Table 13. Summary of the model.

Model	R	R square	R square adjusted	Standard error estimation	Durbin-Watson
1	.717 <sup>a</sup>	.513	.510	.33666	2.093

a. Predictors: (Constant), IC

b. Dependent variable: Total performance

Finally, the results show that IC impact 30.5% on financial performance, 36.2% on market performance, 46.3% on operational performance and 51% on total performance.

## 5 Conclusions

In this new global competition world, characterized by rapid technological developments, more demanding customers and fast-growing information, businesses need to focus on Intellectual Capital (IC) as the most critical organizational asset. This world context is called the knowledge-based economy, where intangible assets, like knowledge, are the most reliable source. Therefore, firms need to revamp their IC, classified by Boedker (2005) as internal, external, and human capital. Furthermore, businesses need to externalize their employees' knowledge and improve their learning processes. This situation demands new ways of treat knowledge and defines peoples abilities. In this sense, there are two types of organisations, knowledge-intensive (with distinctive competence in collecting and transmitting financial information) and knowledge-creating.

Nowadays, the importance of intellectual capital lies in generating and transferring knowledge as essential factors to improve the productivity and efficiency of the organization and generate more excellent value. IC is considered an intangible asset due to its lack of physical evidence. However, despite this lack of tangibility, it represents 80% of its value for organisations since it is the main innovation, creativity, and competitive advantage in companies. Therefore, this research aimed to analyze the correlation between intellectual capital and business performance. The regression analysis showed that the IC contributes 30.5% to financial performance, 36.2% to market performance, 46.3% to operational performance and 51% to total performance. The hypothesis

confirmed that the higher IC, the better the performance in organizations. Since the IC contributes 51% to absolute performance, the higher the IC level, the more significant the IC impact on performance.

Thus, firms can diagnose their IC, which may possess but not correctly identified and managed to improve. So, organisations can directly improve their financial, market, operating and overall performance. It has been mentioned that IC is the most crucial resource for the organisation, thereby managing knowledge, information, and experience. But, is intangible is not transferable. Therefore, the benefits are unique and specific to each organisation, allowing competitive advantage and market differentiation. So, organisation, when discover and exploit IC, can improve performance, strategies, and overall results.

In conclusion, the identification of IC is possible. However, there may be variations between human capital, structural capital and relational capital. Still, all of them influence business performance. It is affirmed that it has a greater effect on the organisation's performance at a higher level of IC. Still, it must be correctly identified to create an organisation's work plan, which can improve financial, operational, and market performance, enabling strategic projects to make a one-of-a-kind company, thereby creating an excellent value in the organisation. IC is unique in each organization, and it does not matter if it is from the same corporate group, from the same sector or located in the same city. It then depends on the organisation, so knowledge management is necessary—the task of current administrators in the development of organisational learning. We proposed this research as a tool to identify the organisation's IC and thus improve their performance goals.

studies, problem solving, “brainstorming” or decision-making, as well as in various documents development.

The analysis summarizes 10 years of pedagogical and practical experience of the authors in the development of business models based on mind maps.

The paper is focused on the new typology of the main mistakes in mind-mapping, based on the analysis of more than 750 mind maps of both senior students of St. Petersburg State University and students of Executive MBA programs. Errors revealed include significant errors in development, in particular, semantic errors, including errors of understanding and fragmentation.

In general, errors analysed in the paper are caused by lack of skills in systemic and structural analysis in terms of concepts categorization and generalization.

## 1 Introduction

Since ancient times, visualization has been considered as a powerful tool of cognition. Nowadays information flow overload is typical for our daily life. It becomes more and more important to find a tool to visualize complex information and big data. This has led to the emergence of new areas of research related to visualization (infographics, cognitive graphics, virtual reality, computer graphics, etc.) (Al-Fedaghi & Makdessi, 2020; Matrix & Hodson, 2014; Cairo, 2013; Raputo, 2011). The main aim of these new types of graphical presentation of information is to make complex concepts simple and visually friendly for perception and learning; in fact, they serve to compress and simplify the information.

## 2 Mind maps development

From the well-known practically used types of diagrams, mind maps were selected as the most common, convenient, and simple method for the proper representation and design of professional knowledge, business ideas, projects, functions, or any other complex conceptual structures (Davies, 2011). Mind maps reflect hierarchical relationships among the concepts associated with the central key concept and radially presented around it; and allow the analyst to reflect in details the features and patterns of the domain with their specific relationships

(Beel & Langer, 2011; Chernigovskaya et al, 2005; Buzan&Buzan, 1996). Buzan formulated the idea of mind maps in the 1970s as a compact means of organizing abstracts, he later deepened and enhanced this idea, which was later brought to software implementation and was widely used in various fields of education, research and business (Buzan, 2018).

The paper describes a classification of main errors and mistakes of analysts of mind mapping as there is mostly research about the effectiveness of mind mapping as a learning tool (Wan Jusoh & Ahmad, 2016; Rosciano, 2015; Chei Chang, 2008). On the one hand, mind maps are used to generate, visualize, structure, and classify ideas, on the other hand, to facilitate (accelerate) research (Kernan et al, 2018; Crowe & Sheppard, 2012), problem solving or decision-making (Koznov et al, 2011; Roem, 2009; Hverle, 2009; Lim & Klein, 2006), as well as in various documents development (Margulies & Valenza, 2005).

Mind maps can be used in teaching both to explain and to check the material learned. In this case, the structure of the mind map serves as a criterion for understanding the studied subject. Mind maps can be useful for group projects, case studies, etc. Due to the simplified and clear representation of ideas in a graphical form, mind maps are sometimes used to activate “brainstorming”, when solving organizational problems and carrying out planning (Koznov et al, 2011; Lim & Klein, 2006). Mind mapping allows thinkers and analysts a visual-verbal way to delineate the moment of reflection and to capture that moment in order to preserve its structure. This way mind mapping practices deep thinking, which leads to easier self-regulation.

The idea of mind maps (according to Buzan) is to use and combine the functions of logical and imaginative thinking to achieve holistic and visual representation of the concept under consideration. In fact, this is actually a transition from sequential (text) presentation to parallel (network). Buzan declared three rules for mind maps – use different fonts (decreasing from the center), different colors and graphics in order to increase clarity. This method is proposed as a compact tool for organizing abstracts and has begun to be used as a powerful tool of thinking when doing research, innovation, business ideas, political discussions, and pedagogy.

Figure 1. Example of an abstract mind map

The rules for the mind map development according to Buzan are presented below in Figure 1:

- a) the main concept is presented in the central image (A);
- b) basic concepts and / or processes related to the main one diverge from the central image with the help of branches, which are called keywords and images (B, C, D, E);
- c) branches form a coherent hierarchical structure.

Summarizing the experience of mind maps developing and analysts training, there is an opportunity to formulate a number of heuristic rules that facilitate mind maps construction:

*Rules to promote depth of understanding*

- a) Rule of Systems Thinking: "Try to use all the elements, not selected fragments".
- b) Rule of Good Generalization – the rule of homogeneity of the presented concept. The concepts at one level of the hierarchy should be of the same nature and associated with the "ancestor" concept by one type of relationship.

These two rules require significant cognitive effort and systems-analytical thinking skills.

*Rules to increase visibility*

- a) Buzan's Rules – about the use of color, pictures and font reduction when moving away from the center (Buzan 2018; Buzan&Buzan, 1996).
- b) Occam's Razor Rules: "You should not multiply entities unnecessarily".

- c) "Don't use serif fonts". For example, Times New Roman.
- d) "The mind map node must contain nominative phrases, no more than three words." For example, "railroad" or "input financial flows".

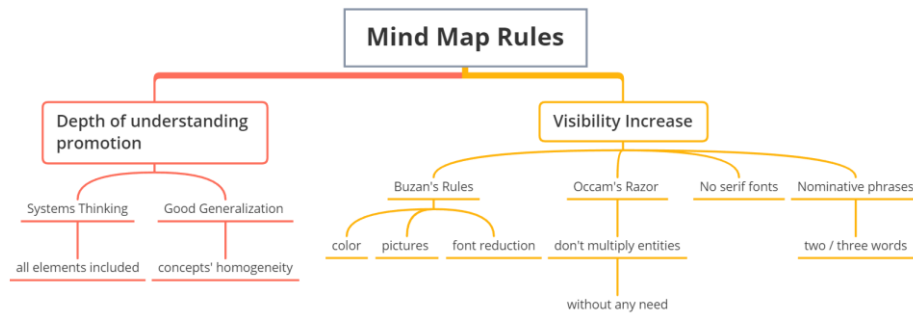

Figure 2. Example of a mind map reflecting major mind maps development rules

### 3 Ability to generalize as a cognitive issue

Generalization is a fundamental task that is solved by every cognitive system in essentially every domain. The task of the analyst in developing a mind map is to cope with the problem of materializing and generalizing their own representations, their adequate and unambiguous representation in the map. It is important for the user to read and interpret the map correctly, even in case when it causes cognitive dissonance.

There are two strategies for developing mind maps – deductive (top-down) and inductive (bottom-up). The first is associated with analysis and decomposition, the second – with the synthesis and construction of concepts.

A serious methodological problem is associated with the choice of the criteria of generality: decomposition or synthesis criterion.

For a deductive strategy, the central concept is broken down sequentially at each level according to the selected criterion or feature. For example, when building a map of modern software, you can use the operating system criterion (Windows or Mac OS) at the first level, or you can use the manufacturer's country. Accordingly, the maps will be different. Then the first rule of good decomposition can be proposed: "The principle of decomposition should be clear and transparent".

You can also choose different features for the inductive strategy. Thus, a set of concepts (Paris, Rome, Tokyo, Moscow, St. Petersburg, Mumbay) can be categorized using ten grouping options depending on the selected attributes. For example, the partition  $X = \{(Paris, Moscow, Petersburg, Rome), (Tokyo, Mumbay)\}$  corresponds to the division according to the clear criterion "Europe – Asia", and the partition  $Y = \{(Paris, Rome, Petersburg), (Moscow, Delhi, Bombay)\}$  – not really clear. In this case, the division Y corresponds to the division according to the principle of "the greatest collections of world art."

Another problem is related to the systems thinking of the analyst, which allows to highlight the concepts of one level of abstraction. This characteristic is associated with the analyst's individual cognitive style, an individually unique way of processing information about the world around: individual differences in the perception, structuring, analysis, assessment and categorization of what is happening (Kholodnaya, 2002). It reflects the specifics of each person's experience and serve as an individual way to adjust the course of cognitive processes.

Cognitive styles – as a broader concept – characterize individual unique ways of studying reality (Kholodnaya, 2002). Four groups of cognitive styles and the corresponding levels of style behavior are identified: styles of information coding, styles of information processing (cognitive styles), styles of thinking and epistemological styles.

Cognitive styles have individual variability. They are related to the success of performing any activity and are not limited to knowledge, skills and abilities of a person. Cognitive styles characterize the specifics of the mindset of a particular person and the distinctive features of the intellectual behavior, and each cognitive style is responsible for a certain aspect of the decision-making process. Thus, cognitive styles are responsible for the construction of a realistic (objective) mental "picture of the world" and the regulation of the process of cognitive reflection.

Individual cognitive style is a subsystem of an individual activity, reflecting its gnostic components – methods of receiving and processing information, which are developed based on the individual specifics of the organization of cognitive processes, affecting all levels of the mental hierarchy.

Cognitive style is especially important when using mind maps to design ontologies. In this case, a number of systemic restrictions should be imposed on

the process of forming concepts of a lower level of the hierarchy, the major of which is the rule of good generalization.

#### **4 Drawbacks of generalization**

The paper proposes the new typology of the main mistakes in mind-mapping based on the analysis of more than 750 mind maps of both senior students of St. Petersburg State University and students of Executive MBA programs.

The main difficulty in mind map development is the systemic development of the first level concepts that describe the central idea. A clear and understandable mind map can be drawn by an expert. Newbies often end up with confusing and indistinctly organized maps due to breaking the homogeneity rule. This rule is at the heart of any taxonomy, since the division into classes usually occurs according to ONE characteristic.

This means that concepts of the same level require belonging to the same level of generalization. The concept of "generalization level" requires understanding of the methods of system analysis (class-subclass-element of the class) and deep knowledge of the features of the mind maps.

So, when decomposing the concept of FRUIT, one of the correct series of concepts of the first level will be: "apples, pears, tangerines". All of these objects belong to the same granularity or generalization level. And the row "apples, pears, citrus fruits" will be wrong. "Citrus" represents higher level of generalization.

Elements of one level of generalization are associated with a higher concept by one type of relationship, they are homogeneous, i.e. all signs or attributes of a concept, or all of its components, or associations. So, in Figure 3, the objects of the lower level are not homogeneous. The object "pockets" does not extend a number of presented attributes (such as manufacturer, price, and weight). It is related to the central concept of the "backpack" by the "part – whole" relationship.

Figure 3. An example of homogeneous mistake breaking the rule of good generalization

Errors revealed are presented in figure 4 and include significant errors in development, in particular, semantic errors, including errors of understanding (there is no understanding of how the knowledge domain works, hence inadequate categories, incorrect attribution to categories) and fragmentation (the map reflects only part of the problem). These errors also include errors in the systematization of elements of the knowledge domain. Often this is an excessive fragmentation of concepts and excessive details as a result of violation of the Occam's Razor rule.

Figure 4. Typology of mistakes in mind maps development

The most "complex" and difficult to correct error of heterogeneity of concepts of the same level can also be classified as systemic (see Rule B of section 2). The mistake occurs when making the first two system errors and a lack of map design.

In general, such errors are caused by the lack of skills in systemic and structural analysis, in terms of categorizing and generalizing concepts. In addition to the lack of skills, these errors can be explained by the characteristics of the analyst's cognitive style (Kholodnaya, 2002; Santos et al, 2010; Cuneo et al 2018). In particular, there is a characteristic "ability to generalize", which cannot be

corrected either by training or experience. The analysis of design errors is diagnostic, that is, the map exposes knowledge gaps and peculiarities of individual thinking.

## **5 Conclusions**

Visualizations allow you to get to a higher level of conceptual generalization of large and very large amounts of data, to facilitate communication gaps between different groups of researchers and experts, between students and teachers.

Aiming at the development of simple concepts that are complex but visually friendly for perception and learning mind maps serve as a powerful tool of cognition that helps to visualize, retain and compress the information needed.

The paper discusses the basic principles of the formation of mind maps and analyzes the typical mistakes of analysts. For the first time, a classification of main errors and mistakes is proposed taking into account syntactic, semantic and pragmatic aspects. The analysis of the most common errors associated with the violation of the rules of good generalization and reasonable minimalism is given.

In general, errors analysed in the paper are caused by lack of skills in systemic and structural analysis in terms of concepts categorization and generalization. Besides, these errors can be explained by the characteristics of the analyst's cognitive style. In particular, there is a special generalization ability, which cannot be corrected either by training or experience. Analysis of design errors is a diagnostic tool, that is, the map exposes knowledge gaps and thinking patterns of its author.

The paper may be of interest to both intelligent systems' developers and knowledge analysts as well as to management and knowledge management practitioners; it summarizes ten years of experience in teaching and training visual-analytical thinking skills as part of Bachelor, Master and Executive MBA Programs and corporate trainings.

### **Abstract**

This paper accounts for the determinants of sectoral specialization in knowledge intensive business services (KIBS), measured by the KIBs location quotient across the Italian provinces (NUTS3), using ISTAT province level panel data from 2012 to 2017. The aim is to see whether increases in agglomeration of activities measured by urbanisation economies and vertical linkages, controlling for knowledge base and absorptive capacity of provinces, push firms to specialize in Knowledge Intensive Business Services (KIBS). More in detail the impact of agglomeration economies, Hirschman linkages between KIBS and their manufacturing users, and innovation activities will be identified by such variables (i.e. localization and urbanization economies; intermediate demand of KIBs services, a proxy for input-output linkages; information and communication technology, public expenditures in research and development). Spatial models, SAR, but especially an IV- that allow us to take into account the endogeneity problem related to some variables

like population density and Intermediate demand –are employed in order to get spatial effects in explaining province specialization in KIBS.

The results show evidence that urbanization economies and input-output linkages, positively affect specialization in KIBS between the provinces.

## 1 Introduction

The theoretical and empirical analysis about Knowledge Intensive Business Services (KIBS) represents an innovative portion of the research activity of the last 15 years because previous attention was especially devoted to the manufacturing services.

KIBS have become of particular importance because they provide knowledge-intensive intermediate inputs to private and public organizations and represent a guarantee of competitiveness in the knowledge-based economy. Moreover, they are characterized by specific production and innovation processes, which require close interaction with their clients and have the potential to spur innovation in other economic sectors (Di Giacinto et al., 2020). An increase in the demand of KIBS services by most firms both in Italy and around the world has developed during the last years.

The researchers have been interested in several dimensions and relationship. Some works investigated on the impact of BS (business services) on growth rate of employment, valued added and productivity (Francois, 1990; Kox and Rubalcaba, 2007a, 2007b). Other studies have considered the innovation behaviour and the differences between KIBS and manufacturing, considering several independent variables such as R&D expenditure, R&D cooperation, external sourcing activities and so on (Teixeira and Santos, 2016). Further studies support the evidence on the relationship between KIBs innovation and economic growth especially in the manufacturing sector also considering the effect on productivity (Griliches, 1995, 1998; Loof and Heshmati, 2001; Crepon et al., 1998; Klomp and van Leeuwen, 1999; Evangelista, 1999; Krempet al., 2004). Cainelli et al. (2006) following the literature related to Schumpeter (1934; 1942) and to

Schmooklerian theories (1962; 1966) explore the two-way dynamic link between innovation and economic performance.

Besides, the effect of an increase in urban population and in vertical disintegration on business services specialization of territories has been investigated more recently with respect to the EU regions (Meliciani and Savona, 2015; Gallego and Maroto, 2015), and also with reference to the geographic localization and productivity of KIBS firms in Italy focusing on Local Labour systems (Di Giacinto et al. 2020) and on specific metropolitan areas (Antonietti and Cainelli, 2016).

In line with this literature, this study accounts for the determinants of specialization in knowledge-intensive business services, measured by the relative share of employment in KIBS across the Italian provinces, using ISTAT NUTS3 level panel data from 2012 to 2017.

In our analysis the impact of agglomeration economies, and Hirschman linkages between KIBS and their manufacturing users, and innovation activities will be considered. Each one of these determinants will be identified by variables like localization and urbanization economies; input-output linkages; information and communication technology, public expenditures in research and development, which will be the main proxies adopted in our empirical analysis.

The idea is to see whether increases in agglomeration and vertical disintegration, in addition to knowledge base and absorptive capacity of the provinces (controlling for the presence of these factors in neighbouring provinces), push firms to specialize in KIBS. Spatial models, SAR, but especially an IV- that allow us to take into account the endogeneity problem related to some variables like population density and Intermediate demand –are employed in order to get spatial effects in explaining province specialization in KIBS.

The paper contribution to the literature on the agglomeration economies with regards to KIBS localisation in Italy is twofold. First of all, we focus on exploring the province dimension and, secondly, we disentangle the subsector dimensions. To our knowledge there are no papers that investigated this topic considering all the Italian Provinces allowing the reader to capture the differences among them. In addition, given that among KIBS there are Technological Knowledge Intensive Business Services (T-KIBS)-related to scientific and technological knowledge such as R&D services, engineering services, computer services - and Professional Knowledge Intensive Business Services (P-KIBS), who are more traditional professional services legal accountancy, and many management consultancy and

marketing services, our analysis also will try to consider sub sectors of KIBS services capturing their heterogeneous patterns.

More in detail this analysis tries to answer the following questions. Are the urban spatial structure and the KIBS location related? Considering eight KIBS sectors: is there a relationship between their activities and localization economies? What are the other determinants of specialization in KIBS and how these determinants affect each one of eight sector of specialization?

The results obtained considering the KIBS and each 2-digit subsector, show evidence that localization and urbanization economies and input-output linkages positively affect specialization in KIBS in the provinces.

This paper is organized as follows: the next section presents the review of the literature on agglomeration, vertical disintegration and productivity. Section 3 describes the most important variables employed in the analysis. Section 4 shows the estimation strategy and the results are discussed in Section 5.

## **2 Review of the Literature on Agglomeration, Vertical Disintegration and Productivity**

The issue of agglomeration economies has been crucial in the analysis of the localisation of KIBs. KIBS are sensitive to spatial agglomerations, which are crucial for their success and competitiveness (Audretsch, 1998; Scott, 1988). KIBS benefit from proximity to sources of information (Porter, 1990) and to knowledge spillovers (Henderson, 2000; Krugman, 1991). They get access to a labour force with good competences and skills (Coffey and Shearmur, 1997) and major expertise. Besides, they localize in high-density areas near customers, which favour firms' access to the market to undertake the necessary exchanges (Duranton and Puga, 2002, 2005; Krugman, 1991; Puga, 1998).

A large evidence has put forward that business services (BS) in general tend to cluster in dense urban areas which exhibit a strong functional specialisation in knowledge-intensive and high skilled activities. Hence, urbanization externalities favor regional specialisation in KIBs as these mainly serve other high skilled and knowledge-intensive services, also concentrated in large urban areas. The Hirschman forward linkages between BS and their manufacturing user sectors and an innovation- prone regional environment are important factors of location of BS. For example, Guerrieri and Meliciani (2005) discovered that a number of knowledge-intensive manufacturing activities like office and computing

machinery, professional goods, electrical apparatus and radio, television and communication equipment, and chemicals and drugs businesses are the main demanding economic agents of advanced services.

Accordingly, regional specialization in KIBS is expected to be positively and considerably supported by: the regional urbanization state, KIBS immediacy to knowledge spill-overs, KIBS availability of a highly skilled labour force, KIBS closeness to key customers.

In 2008 Antonietti and Cainelli have first underlined the importance of agglomeration externalities in affecting the choice to relocate knowledge-intensive activities as geographic proximity, knowledge spill-overs and closer interaction among agents make it easier for firms to manage complex interactions and to increase their competitiveness. Meliciani and Savona (2015) and Gallego and Maroto (2015) wrote seminal papers on the spatial analysis of clustering of KIBs in Nuts-2 regions. Employing a Spatial Durbin Model, Meliciani and Savona (2015) showed that urbanisation economies, the spatial structure of intermediate sectoral linkages and Information and Communication Technologies, are important factors in determining the specialisation in BS. Gallego and Maroto (2015), adopting spatial autoregressive models also analyse how agglomeration economies affect KIBS localization strategies. They find that KIBS also benefit from knowledge spill-overs and availability of a highly skilled labour force.

Kekezi and Klaesson (2020) show that the distance decay of spillovers is fast. Only local concentrations of KIBS seem to be important. Over longer distances, they rather observe negative outcomes for trademarking, indicating possible spatial competition effects.

Zhang (2020) show that unlike manufacturing and traditional services, KIBS are characterized by relying heavily on highly skilled employment, intense interaction with clients, and professional knowledge. Hence, approaching to an appropriate labour force, reducing the cost related to transport and transaction, and rising knowledge flows are the main characteristics through which agglomeration economies fund to KIBS performance.

Antonioli, Berardino and Onesti (2020) using the Word Input–Output Database on EMU19 countries concluded that disparities are growing in the composition of national productive structure and they are even more pronounced when we consider intersectoral dynamics, confirming the Krugman position about the increasing specialisation among EMU countries. The core countries (central EMU)

show a higher level of KIBS integration in manufacturing than peripheral ones (southern and eastern EMU).

Di Giacinto, Micucci and Tosoni (2020) present evidence of a positive and significant urban productivity premium in KIBS sector, which is more recognizable compared with the generality of non- knowledge-intensive services activities and also a bit larger compared with the average premium estimated for the remaining part of knowledge-intensive services.

Serrano (2019) shows that (a) there is a relationship between urban spatial structure and KIBS location; (b) KIBS localise in a polycentric form in search of urbanization economies; but (c) particular KIBS are very concentrated in just a few subcenters, looking for localization economies; (d) proximity to the core and agglomeration economies are a factor in the location of KIBS.

Quite a large evidence has emerged lately concerning the agglomeration, productivity and vertical disintegration of KIBs. However, the topic of agglomeration economy of KIBS sector still needs further research. In this paper we fill a research gap by investigating not only KIBS, but also its 2-digits subsectors, as analysing the localization patterns of KIBS, one should draw attention to the technological base of the different KIBS categories as localization factors do not seem to influence the localization strategies of the different KIBS subsectors alike given that among KIBS there are Technological Knowledge Intensive Business Services (T-KIBS)-related to scientific and technological knowledge such as R&D services, engineering services, computer services-and Professional Knowledge Intensive Business Services (P-KIBS) who are more traditional professional services legal accountancy, and many management consultancy and marketing services Also conducting the analysis for Italy at Province level gives a different perspective to the subject as usually the study has been conducted for Italy based on NUTs2 regions (Meliciani and Savona, 2015), LLMA (Di Giacinto et al., 2020), or municipalities units (Antonietti, R. and Cainelli, G., 2016).

### **3 Data**

The data used in the analysis are taken from ISTAT and cover information for 110 spatial units at NUTS-3 level (provinces) for the period 2012-2017. So, the total number of observation is 660. The classification of KIBS used throughout the analysis relates to the ATECO 2007 classification (see Table A1 in Appendix for

additional details), which is of common use in Italy. The aim is to cover the broad spectrum of KIBS, but also to make the sample as accurate as possible. The reader will identify hereinafter how this differentiation supports the analysis of the results. Table 1 shows the variables used in the analysis.

### **3.1 Dependent variable**

We compute the regional specialization in KIBS for any of the Italian NUTS-3 regions (provinces) that are included in the analysis. We apply the location quotient (LQ). The ratios indicate whether or not a certain province economy has a greater share of KIBS activity than expected when compared with a reference area. We compute the measure of employees in the KIBS sector using the ISTAT database that provides information on the number of persons employed in each KIBS sector and also on the total employment (TEMP) at both province and at national levels. Data for the employees in KIBS cover the total number of persons who work in KIBS firms while the data on total employment account for the number of employed people, be they either employees (working by agreement for another resident unit and receiving remuneration) or self-employed (owners of unincorporated enterprises).

The ratio below is applied (1):

$$LQ_{pt} = (\text{number of employment in } kibs_{pt} / \text{total employment}) / \text{number of employment in } kibs / \text{total employment} \quad (1)$$

where p and t are the province and the time, respectively. An LQ ratio of employment in KIBS and in each KIBS sub-sector are built. An LQ ratio equal to 1 means that the NUTS-3 region under consideration has the same percentage of employment in KIBS as does the total Italian reference area. LQ ratios that are below or above 1 indicate that the regional employment in KIBS is, respectively, less or greater than expected in comparison with the reference area.

The location quotient measuring specialization in KIBS at the province level has been used to map Italy in terms of KIBS specialization in 2017 (Figure 1). It shows KIBS specialization as the whole sector and also by each 2-digits subsectors (62, 63, 69, 70, 72, 73). The maps visually help bringing to light the presence of an agglomeration pattern in the province distribution of KIBS specialization.

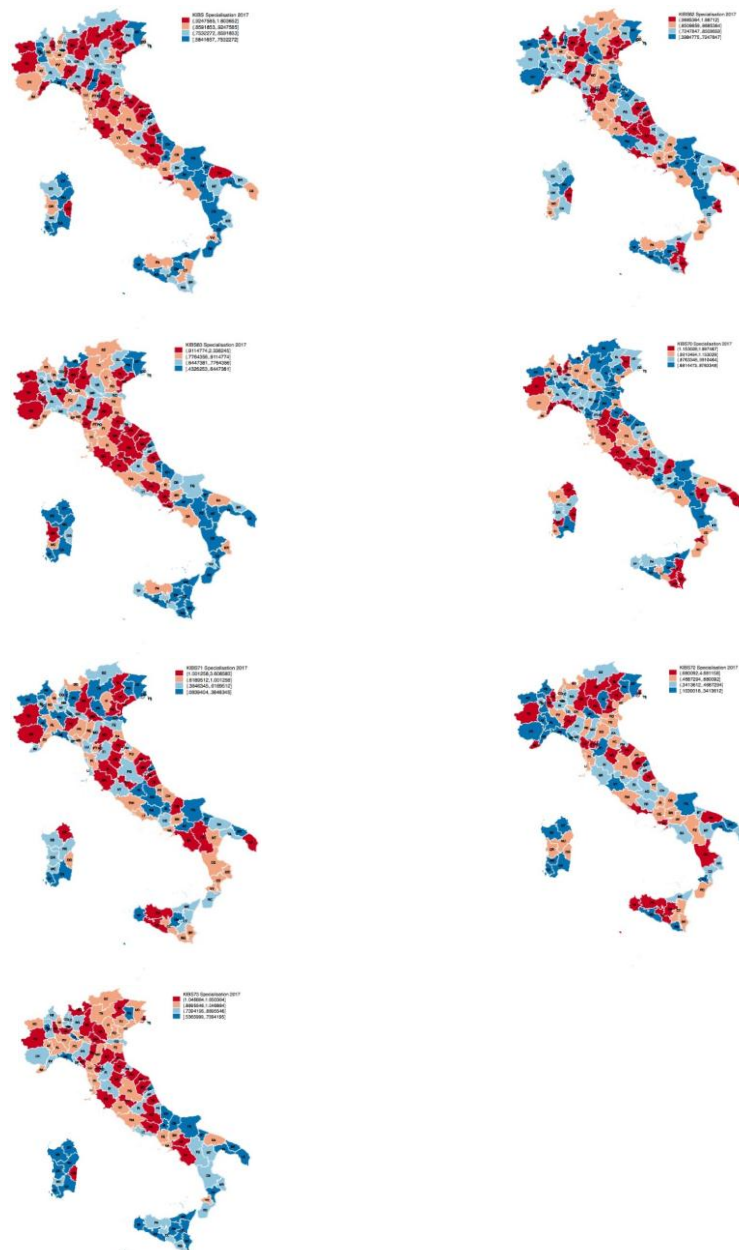

Figure 1. Specialization in KIBS in Italy by Provinces, location quotient (LQ) levels, 2017:total KIBS and 62, 63, 70, 72, 73.  
Source: ISTAT database.

The most specialized provinces in KIBS are those including large urban areas. In particular, the most specialized ones include the “capoluoghi di provincia” (Figure. 1). Moreover, the evidence suggests the existence of a higher clustering in the northern and central Italian regions. In this respect, not only the “capoluogo di provincia” but also other smaller provinces (Rovigo, Treviso, Pisa to mention some) are among the top specialized provinces and they are all clustered within the northern part of Italy. On the other hand, at the bottom of the ranking, there is a predominance of provinces from the Southern Italy. Looking at the subsectors the spread in agglomeration of KIBs between North and South is especially evident in the subsectors 62 (Software production, computer consulting and related activities) and 63 (information activities and other information services). This is also proved by Meliciani and Savona (2015) where they found the evidence of a North-South divide in the specialization of business services.

Also, it is noteworthy to see that in the South Italy there are 2 subsectors that have higher specialization compared to other subsectors: 71 (Activities of architectural and engineering studies; tests and technical analysis) and 72 (Scientific research and development).

The map of subsector 63 is the closest to the spread of specialization of KIBS as whole sector. The highest value of LQ in subsector 62 is 1.89 in Potenza province that are located in the Southern Italian region of Basilicata. And the lowest values (0.4) is in Ogliastra in the eastern part of Sardinia. For subsector 63 it is 2.33 in Siena, central part of Italy in Tuscany region, and 0.43 in Vibo Valentia, Calabria region of southern Italy, respectively. After analysing in the same way the rest of the provinces, it is worth to note that it also proves a North-South divide in KIBS specialization in Italy.

Table 1. Variables of Interest

Variables	Description	Computation	Sources	Years

### 3.2 Independent variables

We introduce a set of determinants, which typically influence the regional specialization in KIBS. These determinants are identified as follows: urbanization, knowledge spillovers, ICT, intermediate demand, R&D expenditure built as indicated in table 2 where the source and the time span is indicated.

KIBS are supposed to group in regions with huge urban areas. The urbanization factor is approached by accounting for a population density indicator following Ciccone (2002), which specifies the share of population over the regional area (in square kilometres). KIBS are also said to cluster in order to benefit from knowledge spillovers. Accordingly, the knowledge spillovers factor is approached by the share of total R&D expenditure over the gross domestic product (GDP) of regions. The regional setting of ICT is another key attribute that influences KIBS agglomeration within a particular area. We use this determinant by considering the percentage of enterprises with a website at regional level.

Moreover, the localization of KIBS is thought to be influenced by the closeness to their clients as it facilitates the transfer of tacit knowledge. Following Meliciani and Savona (2015) we considered the intermediate demand for KIBS (IDEMAND)

that is proxied by the weighted share of employment in manufacturing enterprises that are intensive clients of KIBS over total employment. Intensive clients are identified using the Istat symmetric Input Output tables in 2015. In particular, in order to compute this indicator, we use a vector which value indicate the use of services on output for manufacturing sectors that are above average KIBS users and, for each Provinces and year, we multiply it by the total employment in each respective manufacturing sector. Then, we divide this number by the Province's i total employment in year t.

$$IDEMAND = \sum_{s=1}^M W_j E_{pst} / \sum_{s=1}^N E_{pst} \quad (2)$$

In equation 2 above p is the province, s the sector, t the time, M the number of above average KIBS users manufacturing sectors, N the total number of sectors, E the employment, W the weight given by the average share of KIBS in total industry output as computed from ISTAT symmetric Input Output tables in 2015. A higher value of this indicator suggests a higher provinces employment in manufacturing sectors that are intensive users of KIBS with respect to total province employment for each year.

Finally, a control variable (CAP) is also constructed, by means of a dummy indicator, which takes the value of 1 when the observation refers to a province which is "Capoluogo di provincia"; and 0 otherwise. This variable is expected to be positively related to the dependent variable.

R&DEXP over the GDP and the percentage of enterprises with the broadband a proxy of Information and Communication Technology (ICT)

#### 4 Empirical Strategy

Given the existence of spatial correlation in the dependent variable, in order to perform our analysis, we employ spatial lag or spatial autoregressive (SAR) model (Anselin, 1988) and perform also the IV spatial estimation. These model includes amongst the regressors also the spatial lagged dependent variable<sup>1</sup>. In this context, the models can be represented as variants of the following equation:

$$LQKIBS_{pt}^{SP} = a_p + \rho WLQKIBS_{ptSP} + B_1 IDEMAND_{pt} + B_2 PDENSITY_{pt} + B_3 TRT_{pt} + B_4 R\&DEXP_{rt} + B_5 CAP_{pt} + B_7 ICT_{rt} + MARCHISHARE_{pt} + e_t \quad (3)$$

<sup>1</sup> Robust Lagrange multiplier tests clearly discriminate where the spatial process is allocated, as a spatial lag of the endogenous variation (See Table A2 in Appendix for additional details).

Where in  $\rho \text{WLQKIBS}_i^{\text{SP}} = W$  is the non-negative spatial weights matrix with zeros on the diagonal that formalizes the provinces network structure;  $\rho \text{WLQKIBS}$  is the spatial lagged LQ ratio of KIBS (Total and for each sector separately);  $\rho$  is the SLM parameter.

The variable for province  $p$  and region  $r$  are taken as follows:

- LQKIBS represents the dependent variable indicating the specialization in KIBS, above discussed. We want to point on the use of all the KIBS subsector (62; 63; 70; 71; 72; 73) and specialization (SP) discussed in the above section;
- IDEMAND - represents the share of share of employment in manufacturing sectors that are more intensive of KIBS;
- PDENSITY proxy of agglomeration Economies is the share of population over the province area;
- is the share of Brand over population;
- TRT represents the accessibility index;
- R&DEXP is the R&D expenditure over the GDP;
- ICT is a proxy of Information Technology and it is given by the percentage of firm that have the broad band;
- CAPITAL that is a dummy for regions where capital cities (Capoluoghi di provincia) are located;
- MARCHISHARE that represent the share of brand over population
- $e_{it}$  represent an error term assumed to be independently and identically distributed with a mean of zero and a variance of  $\sigma^2$ .

Moreover, the potential endogeneity of some variables (e.g. IDEMAND and PDENSITY)<sup>1</sup> promotes the risk that OLS estimates are upward biased. In order to test the existence of endogeneity in the model, the Hausman (1978) specification test is used that allows one to choose between the OLS estimation and an alternative two-stage least-squares (2SLS) estimation using instrumental variables.<sup>2</sup>

*1 The Population density is strongly influenced by the geophysical characteristics of the reference area, which may or may not include non-habitable areas (high mountain areas, water surfaces) and by the different settlement contexts of urban and rural areas.*

*The Intermediate demand might be affected by the problem of reverse causality.*

*2 The Hausman test is based on the idea that the covariance of an efficient estimator and its difference with respect to an inefficient estimator is zero. The statistic, under the null hypothesis of endogeneity of the regressors, is asymptotically distributed as a  $\chi^2$  with as many degrees of freedom as non-exogenous regressors are present in the specification. In the present case, the null hypothesis cannot be rejected.*

Given that in order to implement the instrumental variables estimation and following other papers on regional specialization, two instruments are employed: the proxy for regional scale economies (the ratio between employment and number of firms) (that is, Paluziè et al., 2001), and the total land area of the region (that is, Artis et al., 2009; Brulhart and Mathys, 2008; Ciccone, 2002).

The analysis uses these two instruments to enable the performing of over-identification tests as well, which indicate that endogeneity is a problem. This paper therefore deals with this issue by performing 2SLS estimations (F-statistic of first-stage estimation is higher than 10, being instruments used in 2SLS commonly valid).

## 5 Results and Conclusions

The results, presented in table 2 and 3, are consistent along the two models (SAR and 2SLS) model considered<sup>1</sup>. The positive coefficient of the spatial lag confirms the descriptive picture provided by the Moran scatter plot (See Figure A1 and A2 in Appendix) and establishes the spatial dependence in KIBS specialisation. Looking at the agglomeration variables, the population density show mixed results positive in some subsectors; as to the negative or not significant signs obtained it is not surprising and seems to be in line with the pattern of the last years according to which the higher is the population density, the less the level of specialization in some specific KIBS that are more likely to be in places where the agglomeration economies are decreasing (i.e congestion effects)-see Gallego and Maroto, 2015. As to the dummy for provinces with capital cities this is highly correlated with the total KIBS specialization, confirming that urbanisation externalities are key determinants of regional specialisation in KIBS and also in most of the subsectors. and the tendency to agglomerate toward the top of the urban hierarchy. In addition, this highlight a specific role played by urban centres as attractors of these services.

Moreover, our findings related to IDEMAND from manufacturing industries also represents a major determinant of KIBS specialisation across regions.

These results, as in Melicaini and Savona (2013) differ from those by Shearmur and Doloreux (2008), who observe that in Canada KIBS serving a manufacturing may not automatically leave urban areas and consider to be adjacent to their

---

<sup>1</sup> Sargan statistics for mutual consistency of the available instruments are made on, and the test rejects the null hypothesis of correlation between the instruments and the error.

markets. The different results may depend on differences in the unit of the analysis (European NUTS2 regions vs smaller regions in Canada) or by differences in the period considered (Shearmur and Doloreux find strong concentration of KIBS in 2001 but also notice that over the period 1991–2001 KIBS developed quicker in municipalities with good access to manufacturers and that this may be indicative of a rising local synergy).

This is an important result because it implies that urbanisation externalities are counter-balanced by the effect of centrifugal forces leading KIBS to locate outside urban areas; on the other hand, it shows that the location of KIBS also depends on previous regional sectoral specialisation.

As to the TRT, the coefficient is positive and significant overall and for some subsector, this means that the lower is the accessibility the greater is KIBS' need for co-localization. Differently by the literature (Antonietti and Cainelli, 2008; Meliciani and Savona, 2009, Gallego and Maroto 2015) ICT, here proxied by the Broadband diffusion across firms, does not show interesting results. As in Meliciani and Savona (2015) that found a relationship between patents over population across regions and BS specialisation, here the level of MARCHISHARE is a key determinant and has a large impact on KIBS specialisation. Also, the innovation environment and knowledge infrastructure of the region, proxied by R&D expenditure, has a positive and significant impact on overall KIBS specialisation (Table 2), anyway the result is not consistent along the two models, but the coefficient is positive (even if not significant) as to most of the sectors considered.

### **Abstract**

In the so-called ecosystem economy, new platform-based business models evolve rapidly based on the prospects of digital technology. Especially in the B2B context, data-driven platforms are highly relevant. Thus far, little research has been conducted on the supply side of data-driven platforms and especially on service providers, the so-called complementors. Therefore, this paper offers insights into the various facets of complementor relationship management (CoRM). The paper aims to develop a framework for the management of complementors of data-driven B2B platforms. For empirical evidence, we draw on 14 semi-structured expert interviews with platform managers and complementors. The findings outline two big areas of CoRM and discuss distinct characteristics of partner management and technology management. For partner management the differentiation into open and closed platform needs to be taken into account for complementor relationship management. Moreover, our study reveals the key factors of technology management which lead from platform infrastructure to digital applications like digital twins or predictive maintenance.

**Keywords** – Entrepreneurship; New Technologies; Digital Platforms; Data Management, Complementors

## 1 Introduction

According to a study by the International Data Corporation (IDC), the annual amount of data produced worldwide is expected to increase to 177 Zettabytes by 2025. If all this data were to be stored on DVDs and lined up one after the other, it would be possible to circumnavigate the earth 222 times (Reinsel, Gantz & Rydning, 2018). Hence, innovative business models for data-driven platforms evolve rapidly, disrupt traditional industries and face new opportunities due to changing market constellations and increasingly complex value creation processes (Adner & Kapoor, 2010; Adner, 2017; Jacobides, Cennamo & Gawer, 2018; Reuver, Sorensen & Basole, 2018; Jacobides, 2019). In particular, the shift from classical pipeline businesses to innovative co-evolving platform ecosystems has fundamentally transformed industry architectures (Eisenmann, Parker & Van Alstyne, 2007; Van Alstyne, Parker & Choudary, 2016; Rietveld & Schilling, 2020).

A digital platform is a business model that uses technology to connect people, organizations, and resources in an interactive ecosystem with the potential for a nonlinear increase in utility and value (Parker, Van Alstyne & Choudary, 2016; Hein et al., 2019a). While digital C2C or B2C platforms are already well established, the landscape for data-driven B2B platforms is still relatively undefined and lots of platforms are competing for dominance. The core function of a data-driven platform is to offer an open infrastructure to collect, exchange, analyse, use and evaluate data. Besides the platform provider, service providers on the supply side of the digital platform, the so-called complementors, play an important role in the process of value creation (McIntyre & Srinivasan, 2017). Only based on collaboration with those entrepreneurs the necessary knowledge for platform value creation is available (Parker, Van Alstyne & Choudary, 2016).

Thus far, little research has been conducted on complementor relationship management (CoRM) in the context of data-driven B2B platforms. Prior research analyses CoRM from a platform provider's perspective on the one hand (Buchholz, de Bie & Kochendörfer, 2021a) and from a complementor's perspective on the other hand (Buchholz, de Bie & Kochendörfer, 2021b), both with focus on a management not on a technology perspective.

Based on those findings, this paper develops a holistic framework on the different facets of CoRM. Besides the two mentioned perspectives of platform provider and complementor we thirdly add the technology perspective. Hence, this paper will give answers to the following research questions:

*RQ1: Which are the main fields of complementor relationship management for data-driven B2B platforms from a partner management perspective?*

*RQ2: Which are the main fields of complementor relationship management for data-driven B2B platforms from a technology management perspective?*

The paper is organized as follows: The second chapter provides the description of our research design. In chapter three, we present the findings on CoRM regarding the two mentioned perspectives. Finally, the closing chapter summarizes the findings and points out some limitations and possible avenues for future research.

## **2 Research design**

Empirical exploration can be used for research on hitherto neglected phenomena, causal relationships and patterns by depicting and analysing qualitative data. Since all of these criteria and conditions are met for this research field, the study follows Eisenhardt (1989) and Yin (2014) by applying a qualitative research approach to an in-depth investigation of CoRM in terms of data-driven B2B platforms. By relying on semi-structured interviews with open-ended questions, we ensured that all of the perspectives and assessments expressed by the interviewees were captured. We undertook a dyadic research by considering both platform providers and complementors. A within-case analysis was conducted first, followed by a cross-case analysis using replication logic to find commonalities among platform provider and complementor cases (Eisenhardt, 1989; Eisenhardt & Graebner, 2007; Hannah & Eisenhardt, 2018).

Interview partners were mainly extracted from press releases and through network research on social media (LinkedIn and Xing). The explorative case-study approach comprises eight interviews with platform providers as well as six interviews with complementors. All expert interviews took place between November 2020 and April 2021. Due to the coronavirus pandemic, we conducted all interviews either by telephone or video conference. The interviews lasted between 22 and 43 minutes and were audio-recorded and afterwards transcribed with the prior consent of the interviewees. A brief overview of the cases is presented in Table 1. In addition to this primary source, we also considered secondary data such as reports, press releases, and newspaper articles to increase the overall reliability and validity of the database via triangulation (Eisenhardt, 1989; Miles & Huberman, 1994).

Table 1: Data sample

ID	Platform/Company	Position	Perspective	Duration
P1	Software-as-a-Service (SaaS) platform for document management	Platform portfolio manager	Platform provider	43 min.
P2	Industry IoT platform of an industrial manufacturing company	Head of digital enterprise and digital services	Platform provider	29 min.
P3	Industry-and-mobility data platform from the public sector	Head of department	Platform provider	28 min.
P4	Industry 4.0 platform of an agricultural machinery manufacturer	Head of digital transformation	Platform provider	33 min.
P5	Industry IoT platform of an industrial manufacturing company	Process manager of commercials	Platform provider	30 min.
P6	Strategy-and-management consulting company	Managing director, project lead	Platform provider	36 min.
P7	Automated infrastructure-inspection platform	Managing director	Platform provider	31 min.
P8	Data-driven B2B platform for farming	Partnership manager	Platform provider	22 min.
C1	Industrial-services provider for B2B platforms	Partnership manager	Complementor	29 min.
C2	Data-and-analytics services provider for B2B platforms	Key account manager	Complementor	44 min.
C3	Technology services provider for B2B platforms	Senior innovation manager	Complementor	37 min.
C4	Infrastructure service provider for IoT platforms	Business architect	Complementor	29 min.
C5	Digital-applications provider for farming platform	Managing director	Complementor	19 min.
C6	Data-science and software-development provider for platforms	Founder	Complementor	17 min.

### 3 Fields of Complementor Relationship Management

#### 3.1 Data-driven B2B platforms and their participants

*Data-driven platforms* generate, collect, share, and monetise information generated by machines or by users and offer an infrastructure for exchange,

analysis and evaluation by focusing on data (Bundesverband der Deutschen Industrie e.V., 2020). Often, companies lack reasonable methods to strategically exploit the significant new value of the amount of data generated by the Internet of Things (IoT). A promising way to put IoT data to work is to offer data on digital platforms to third parties. With the help of sensors and application programming interfaces (APIs), physical objects become smart devices and can independently trigger activities in processes without human intervention (Deichmann et al., 2016; Davenport & Redman, 2020). In an industrial B2B context this type of platform is named Industrial IoT (IIoT) platform. Within a digital platform, different roles should be mentioned (see Figure 1) (Hein et al., 2019b; Hagiu & Altman, 2017; Lusch & Nambisan, 2015).

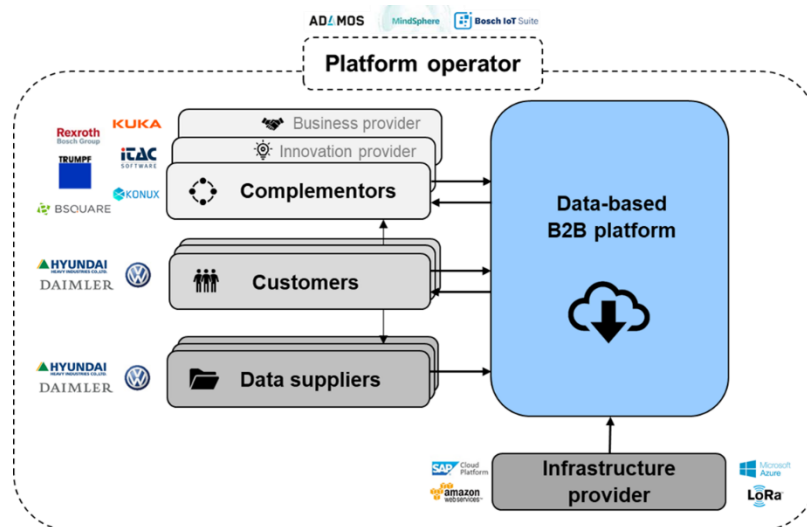

Figure 1: Actors involved in data-driven B2B platforms

(1) The *platform provider* (platform operator, platform shaper, intermediary) creates the basis for the exchange. The provider's role is to orchestrate the interactions between a network of businesses, people and assets that the provider does not necessarily control or own with the purpose of enabling the exchange of value between participants. The provider contributes the technological architecture and ensures the development of the platform's new business model. In addition, the provider must decide which actors are allowed to enter the platform and should be neutral regarding access rights. The provider also defines standards, interfaces, and the rules of interactions (e.g., data privacy policies or

payment terms). Thus, the provider determines the level of openness and the governance criteria to be met for using the platform (Abdelkafi et al., 2019; Schrieck et al., 2017; Tiwana, 2014).

(2) As the proprietary platform itself exhibits elementary or generic functionalities, platform providers depend on complementary services (e.g., software products) offered by third-party service providers, the so-called *complementors* (Baldwin & Woodard, 2008; Gawer & Cusumano, 2008; Hein et al., 2019a). Complementors develop and offer optionally usable complementary products and services for data collection, migration, cleansing, analysis, and processing, e.g., through big data and artificial intelligence tools, which create added value for the user (Hein et al., 2019a; Kansu & Parker, 2018; Davenport & Redman, 2020). The existence of numerous complementors increases the attractiveness of the platform for customers. Apple's Appstore can be seen as a good example for the B2C area.

(3) Complementors differ from *infrastructure providers*, who offer generic underlying technologies such as cloud computing or connectivity (Adner, 2017; Buchholz et al., 2021a; Russo & Wang, 2020). In the case of an open-services platform, infrastructure providers (such as Microsoft and Amazon) are also interested in becoming partners to gain access to the customer data the platform provider owns. They thus also benefit from the services offered and the information accumulated through the platform.

(4) Finally, on the demand side, platform users (*customers*) have to be defined. They transfer their processes onto the platform and are also an important data source for the platform (*data suppliers*). Their willingness to share individual data is a crucial component of the benefits that service providers can derive by using this platform (Kansu & Parker, 2018).

CoRM has to deal with two fields (see Figure 2). First, activities around the complementors themselves have to be managed (*partner management*). Second, topics relating to the technologies used play a major role in CoRM contexts (*technology management*).

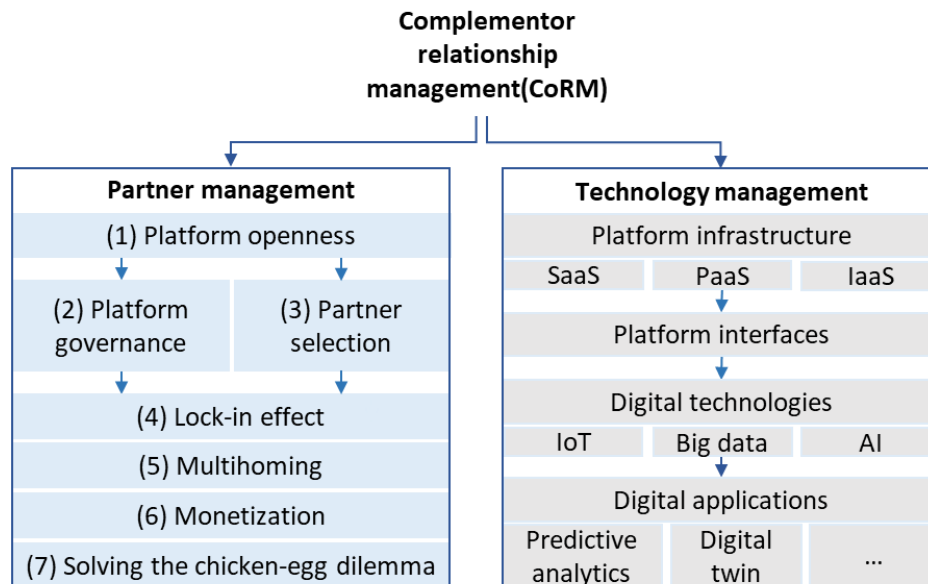

Figure 2: Conceptual framework for complementor relationship management (CoRM)

### 3.2 Partner management

#### 3.2.1 Platform openness

Platform openness has a major influence on the other fields of CoRM - especially on platform governance and partner selection - and is thus mentioned first. The degree of openness describes how a complementor's entry into and use of the platform is regulated. Two possibilities can be distinguished: open and closed platforms. In the case of *open platforms*, no restrictions or limitations exclude certain user groups. Complementors can thus use the offered IT infrastructure on an open platform, for example, to test a new application (Boudreau, 2010). *Closed platforms*, on the other hand, have certain requirements or use monitoring and quality-assurance processes that complementors have to pass through before they can operate on the platform (Van Alstyne et al., 2009). In our case study analysis, we have investigated four open platforms (cases P 2,3,7,8) and three closed platforms (cases P 1,4,5).

A platform must find a degree of platform openness that, on the one hand, attracts complementors while, on the other hand, ensuring that the platform stays permanently under control (Schrieck et al., 2019). The expert interviews confirm

that there is a dependency between the orchestration task of the platform provider and the openness of the platform. The hypothesis is that platforms, as markets, regulate themselves and therefore should be open. Based on this hypothesis, orchestration by platform providers is not necessary because providers who offer services that customers need will be used while those who do not offer the right services will remain unconsidered (Morgan, 2019). The more open a platform is, the lower the requirements are for a strong CoRM (e.g., social platforms). On the other hand, it can also make sense to have stronger restrictions concerning the access of complementors (e.g. P1). If access is restricted for customers, more rigorous selection criteria for complementors are also needed. Finally, a platform must find the appropriate degree of platform openness. On the one hand, it should attract complementors; on the other hand, it should ensure that the platform permanently stays in control (Schrieck et al., 2019).

### *3.2.2 Platform governance*

Platform governance defines the rules and regulations that platform providers need to balance in relation to their own and other participants interests, such as complementors and customers (Marheine, 2020; Shestakofsky & Kelkar, 2020). *Platform-governance mechanisms* help to regulate the transactions between complementors and customers on a digital platform (Lusch & Nambisan 2015; Reuver et al. 2018). The platform provider must achieve a healthy balance between its defined governance rules and the interests of the platform complementors. The platform might also be a competitor for complementors who enter complementary markets with similar services (Ghazawneh & Henfridsson, 2013; Marheine, 2020; Yoo et al., 2020; Zhu, 2019). An unfair distribution of values or a lack of technological necessities - such as appropriate interfaces (APIs) or flexible monetisation methods - can lead not only to the loss of complementors but also to the failure of the entire platform business (Ghazawneh & Henfridsson, 2010; Shestakofsky & Kelkar, 2020). Facilitating the entry of multiple complementors to a platform can be beneficial, but there are some limits. However, platform providers must carefully manage the number of service providers on their platform, as complementors also consider too much competition among complements to be unattractive (Jacobides et al., 2006; Yoffie & Kwak, 2006). Restrictions concerning interfaces provide a particular governance mechanism with which to monitor the entry of complementors on a platform

(Tiwana et al., 2010; Hein et al., 2019a). Platforms have to balance between retaining control on the one hand and fostering third-party innovation on the other hand (Case P7).

The method of *performance management* based on key performance indicators (KPIs) is more beneficial for closed platforms than for open platforms. This is because these platforms choose their complementors more actively and have fewer of them and because the performance of these complementors directly reflects the performance of the platforms. For open platforms, basic data security is an important requirement for applications, but no concrete control measures are relevant (cases P 2, 7, 8 and C1). Closed platforms achieve reliability and quality through control mechanisms and selection criteria. This quality assurance also includes ensuring that there are not too many overlapping offers on the platform (cases P1 and P4). However, platform business is not primarily based on control; it is based more on influence and reciprocity, which involve orchestrating resources rather than owning them (Parker et al., 2016).

### 3.2.3 Partner selection

Concerning partner selection, we found the two directions complementor selection and platform selection. Within the field of *complementor selection*, differences between open and closed platforms could be identified in particular. In case of an open platform, there is often no specific selection process. Those platforms do not choose in detail which service providers are granted access. For closed platforms, predefined services that they want to offer or the prescription of certain technologies might be criteria for complementor selection (Van Angeren et al., 2013). Cases P1 and P4 have specific selection criteria that are applied before a new complementor is included in the platform business. It is certainly beneficial to achieve an overall strategic fit between the platform provider and the complementor and to attract high-quality complements to the platform. Nevertheless, the platform provider must make complex strategic choices in managing the overall value of the platform and how that value can be influenced through the selective promotion of complements (Rietveld et al., 2019).

Complementors are often entrepreneurial start-up companies; therefore, it is difficult to evaluate their service capabilities in advance. The platform provider needs to identify the best-fitting complementors, and, in the best-case scenario, they become leaders in their field. A possible solution to this challenge involves the use of contests organised by platforms; these put the risk back onto the

service providers (Kansu & Parker, 2018). In addition, platform providers can reward successful complements, bring attention to underappreciated complements and influence consumers' perceptions of complementary services (Rietveld et al., 2019). Such incentives can be used to induce and reward the loyalty of preferred service providers (cases P6 and C1).

In addition, the platform selection process has been identified as relevant from the complementor's perspective. *Platform selection* - the procedure used for selecting platforms on which a complementor plans to become active - differs between some cases considered. If complementors follow a multi-homing strategy, an active market scan is mandatory (Case C1). The complementor in Case C2 receives requests from platform operators and is also actively searching for platform operators. Finally, in Case C3, the complementor is involved from the beginning in developing the platform by offering consulting activities and industry networking. However, we found that there are different ways in which complementors choose and become active on platforms.

#### 3.2.4 Lock-in effects

The importance of balancing the interests of different participants on a platform has already been described. This balance plays a central role when considering the phenomena of lock-in effects and multi-homing. *Lock-in effects* keep participants on the platform due to its inherent attractiveness. This leads to increasing switching costs and costs for operating on multiple platforms simultaneously, which makes it difficult for the complementors to change from one platform to another (Kude & Dibbern, 2009; Tiwana, 2014). The higher the asset specificity and the related investment requirements, the higher the dependence between partners and the lock-in effect. A platform's high asset specificity therefore increases the complementors' costs for adopting, operating and maintaining affiliation with a certain platform (Dellermann, 2016). For open platforms, e.g., P 2, 7 and 8, the lock-in effect is not necessarily problematic for the complementor. The experts point out the quality of their technological offerings, the benefits in efficiency and the win-win situation for the participants.

Moreover, an interesting result was obtained regarding the lock-in effect from the complementor perspective. In the literature, the lock-in effect is encountered almost exclusively in a negative context for the complementor. However, the expert interviews with complementors reveal that it can also be the other way round: namely, that the platform may become dependent on the complementor

(Case C3). Based on these findings, the definition of the lock-in effect presented in the theory section must be adapted to the extent that the risk of the lock-in effect exists both for complementors and for the platform provider.

### 3.2.5 Multi-homing

In contrast to the lock-in effect, multi-homing is an adequate complementor strategy. *Multi-homing* means that complementors offer their applications on different platforms (Cusumano et al., 2019). From a platform perspective, this is a risk because complementors may leave the platform when they are more satisfied with another platform. If we look at both phenomena from the perspective of the complementor, it becomes clear that lock-in effects are negative and multi-homing is positive. Offering the complementor's services on multiple platforms opens up access to a larger number of potential customers, reduces the risk and, in terms of economies of scale, boosts profits (Aydin et al., 2019; Lang et al., 2020). The experts consider multi-homing to be the most effective strategy for complementors in general and especially for start-ups. In contrast, the platform provider considers multi-homing to be a danger because knowledge, insights and services may be transferred to another platform, which in turn reduces the exclusivity of the operator's platform (Mukhopadhyay & Bouwman, 2019). The experts indicated that it is important to balance participation in different platforms with the costs of integration (via interfaces) and maintenance of services on the platform. The results also show that multi-homing requires more open platforms and fewer closed platform structures (Case P6).

### 3.2.6 Monetisation

Since the focus of a digital platform is more on cooperation and less on competition between the actors, a fair monetisation concept is essential for the complementary services offered. *Monetisation* concerns how complementors are charged for membership on a digital platform. A platform can operate with a *transaction-based model*, in which complementors are charged only if their services have been sold (de Panafieu and Breitenstein, 2018). Another option is a *membership-based model* in which the complementor has to pay a fee to be listed on the platform. The transaction-based model minimises entry barriers for complementors and therefore often leads to a higher user base. The membership-based model, on the other hand, guarantees a steady stream of revenue even if a complementor does not sell any services within a given period.

In addition, mixed models can be found which include a basic fee plus additional payment based, for instance, on the amount of data traffic or the number of connected APIs (Hodapp et al., 2019).

The question concerning monetisation also reveals differences between closed and open platforms. For example, a prerequisite for using a closed platform is often a subscription to the platform provider's basic product. Only then can the additional services of the complementors be booked. In the case of an open platform, there is no obligation to first subscribe to the platform providers' product (cases P 2,3,7 and 8). In case of an open platform, individual contracts are concluded between the complementors and customers, so there is no contractual relationship between the platform provider and the user groups on the demand and supply sides (cases P2 and P3). However, the opposite is true for closed platforms (P1 and P4), as the platform provider is then responsible for money flow between the users on the platform.

### *3.2.7 Solving the chicken-egg-dilemma*

The attractiveness of a platform increases with the number of users on both sides. Thus, the demand-side benefits from a larger offering of products or services. On the other hand, complementors benefit from a higher number of potential customers (Cennamo & Santalo, 2013; Ott et al., 2018). Without participants, the basic business model - which is to connect providers and customers and facilitate exchange among them - will not be successful (Hein et al., 2019a; Tiwana, 2014). This leads to the following question: How does a platform provider attract those from the supplier side to a platform without the presence of a demand side, and vice versa? This challenge is called the *chicken-egg-dilemma*.

The chicken-egg-dilemma also differs between open and closed platforms. In cases P1 and P4, they supplemented their existing product by offering a platform in addition. Here it is evident that a customer base already existed before the platform started. However, the situation is different for open platforms P2 and P3. In these cases, the chicken-egg dilemma has to be solved to attract users to the platform. Approaches to counteract this problem include reduction of entry barriers, establishment of incentives, use of licensing strategies, use of exclusive contracts, and subsidisation of one side of the market (Reuver et al., 2018; Veisdal, 2020).

From the complementors' perspective, the chicken-egg dilemma is mainly relevant to start-ups, e.g., Case C1. Expert C1 confirms the issue discussed in the literature concerning the unattractiveness of platforms which involve too many complementors while the user is not sufficiently represented. Due to their business models and positions in the market, the chicken-egg dilemma is hardly relevant to companies C2, C3 and C6.

### **3.3 Technology management**

#### **3.3.1 Platform infrastructure**

Besides the management of the platform partner, technology is another field CoRM has to deal with. The platform infrastructure and interfaces, the ground-laying digital technologies and the specific complementary services need to be managed. Concerning the platform infrastructure *cloud computing* is a central component of digital platforms. At its core, computing resources are provided via the internet which companies can use individually. These resources include servers, databases, software and applications. The use of cloud computing offers numerous advantages for companies: Pay-per-use models, low maintenance efforts, high computing power, access independent of time and location are a few of them (Lindner et al., 2020; Gupta et al., 2019). The development of cloud solutions instead of inhouse-on-premise solutions is a highly topical issue. In a study by the International Data Cooperation (IDC) from 2019, 70% of the CIOs stated that they would implement "agile connectivity" via API by 2021 to enable interfaces to cloud providers, start-ups and other providers (Eriksdotter, 2019). Three different service models for cloud computing are possible:

*Infrastructure as a Service (IaaS)* is the virtual provision of data centres, virtual networks, storage and servers. The design of the platform in terms of software or the operating system is entirely in the hands of the user (Shahzadi et al., 2017). This provides the user with high flexibility and scalability (Castro-Leon & Harmon, 2016). The three largest providers (by turnover) in this area are Amazon with Amazon Web Services (AWS), Microsoft with Microsoft Azure and Alibaba with the Alibaba cloud. *Platform as a Service (PaaS)* also offers other cloud-based services in addition to the fundamental structures covered by IaaS (Case P2). Here, the service provider also manages the operating system, the middleware and the runtime of the platform (Hentschel & Leyh, 2018). PaaS is an environment that extends IaaS with structures that allow developers to program, test, run and

update their applications (Giannoutakis et al., 2020; Shahzadi et al., 2017). *Software as a Service (SaaS)* represents the third level of the three cloud computing service models. In addition, the SaaS model provides applications, programs and web tools. Thus, this cloud computing service model includes not only the provision and maintenance of IT-hardware components (Case P1). The service provider is also responsible for administration, maintenance and updates (Castro-Leon & Harmon, 2016). SaaS is aimed less at IT architects and software developers. The majority of the target group addressed by SaaS are end users who use the applications for operational business (Lindner et al., 2020).

### *3.3.2 Platform interfaces*

One important entry barrier that also has an impact on the quality of complementary services is the definition of standardised interfaces. These describe the extent to which the interface between the complementary service and the platform is stable, formalised, and well documented (Dellermann, 2016). Such clarity and transparency offer technological stability to the complementors and hence reduce technological uncertainty (Tiwana, 2015; Kansu & Parker, 2018). An important issue in that context is the integration of the different legacy systems of the players involved. This integration is highly relevant for implementing a successful platform. Without it, both internal and external players cannot access the same database to drive insights and develop products and services (Kansu & Parker, 2018). However, standards can also encourage competition within complementary activities.

*Application Programming Interface (API)* is the interface that enables communication and exchange of data between programs, applications, organizations and things. In the context of data-driven platforms, they play an outstanding role regarding the standardised connection of users to the platform (Iyengar et al., 2017). Cases P2 and P8 are offering standardised interfaces to make connection easier for participants. On the one hand, APIs enable to build a digital ecosystem with the help of partners (complementors and customers) and secure and standardise the connectivity between these entities (Pettey, 2017). On the other hand, they enable the monetisation of data by providing the interface between different entities in the digital ecosystem (Collins & Sisk, 2015).

### 3.3.3 Digital technologies

The digital technologies Internet of Things (IoT), Big data and Artificial intelligence (AI) are the main technologies that are relevant in the context of data-driven platforms.

The *Internet of Things (IoT)* is a network of internet-connected devices equipped with sensors and APIs that can recognize each other and can collect and exchange data by connecting to the internet. Physical objects include machines, vehicles, smart devices, cameras, and sensors among others (Walsh, 2020; Ng & Wakenshaw, 2017). The data generated by the IoT network is the basis for data-driven platforms (Deichmann et al., 2016; Ben-Daya et al., 2019). In pipeline business a machine is basically bound to a location and can therefore only provide its benefit in this local environment. The IoT connects the machine with the internet through sensors and actuators. This allows that a digital image of a machine or the machine operation can be followed regardless of its location (cases P 2, 5 and C1). A data-driven platform collects and analyses the recorded sensor data and the functionality of the machine can be maintained and optimized by using the analysis results (Deichmann et al., 2016).

As the term data-driven already suggest, big data is the basis component for data-driven platforms. In 2001, Doug Laney, an analyst at Gartner Inc., introduced a definition that was used and expanded in the following years to define the term *Big data*. "Big data is high-volume, high-velocity and/or high-variety information assets that demand cost-effective, innovative forms of information processing that enable enhanced insight, decision making, and process automation" (Laney, 2001). Concerning the data structure, it can be distinguished between unstructured, semi-structured and structured data. Especially for unstructured data, big data analytics is offering new opportunities in order to utilize this data strategically for business management purposes within the company (Sedkaoui & Khelfaoui, 2020; Wamba et al., 2017; Gandomi & Haider, 2015). For risk management platforms in procurement this is an important business case.

*Artificial intelligence (AI)* is the ability of a machine to perform cognitive functions associated with human minds by perceiving its environment. This includes data acquisition, interpretation, reasoning on the knowledge, or processing the information, derived from this data for problem solving, and even exercising creativity (European Commission, 2019).

Although the term artificial intelligence has only become widely known in recent years, it was used by researchers already in the 1950s to distinguish it from natural intelligence (Dignum, 2019). A multitude of technologies nowadays is assigned to AI, e.g. machine learning, deep learning, natural language processing or neural networks. In a platform context, AI supports automating business processes, gaining insight through data analysis and engaging with customers and employees (Davenport & Ronanki, 2018). Also the fields of application for AI are extremely diverse. This technology for instance is used in healthcare, traffic safety, manufacturing, consumer electronics, the financial sector or especially currently in the fight against the COVID-19 pandemic (Vaishya et al., 2020). A key component of AI technology in business contexts is extracting patterns from a large amount of data, which can then be used for running a data-driven platform. Based on AI technology, Case P1 is analysing big amounts of documents, e.g., invoices or contracts, to achieve a higher process efficiency.

#### 3.3.4 Digital applications

Predictive analytics and the Digital Twin are among others two important applications on data-driven platforms. *Predictive analytics* helps a company to take an action before a certain outcome of a situation is to be expected. Case P4, e.g., is offering decision support in drilling for farmers. Besides the known concept of predictive maintenance, there are other use cases that utilize predictive technology, such as predictive procurement or predictive production planning (Ogunleye, 2014). Predictive maintenance applied the idea to the maintenance of a machine, which means recognizing the need for maintenance or the threat of downtimes in advance (Wennker, 2020). The ability to strategically plan countermeasures into the production process is a particularly important advantage of predictive maintenance. The failure of one machine or sub-machine can lead to further downtimes in the production process and thus cause high costs. Moreover, the possible procurement of the required spare parts can lead to extended downtimes (cases P 2, 4 and 5). For example, machine defects can be detected via sensors that record a certain level of vibration. Connected to a data-driven platform, the data can then be analysed in real time and, depending on the results, countermeasures can be initiated. In this way, it is possible to identify sources of error that a human being might not even have noticed and downtimes are reduced (Foltyn, 2020). Furthermore, the data can be used by other machine users to optimise their machine usage. Predictive maintenance is a specific data

application of AI that is of central importance, especially when considering data-driven platforms. In open platform ecosystems, such specific applications are often provided by complementors.

A *digital twin* digitally replicates a physical machine, object or process and thus represents the digital counterpart to the physical object (Geisselbauer et al., 2020). The main benefit is, that not only the company itself can use the replica, but also suppliers, customers and other parties involved. Data-driven platforms provide the simulation of future scenarios, deviations, or improvements of the physical object. Thus, processes of the entire life cycle of a plant can be transparently displayed, from the planning phase to the operating phase to maintenance measures (cases P 2, 5 and 7). In addition, networking with other machines, objects and systems included in the value creation process enables a more holistic control of the entire value creation process (Kaufmann & Servatius, 2020; Ivanov & Dolgui, 2020; Ding et al., 2019).

Furthermore, digital twins can be used before the machine even physically exists. Error avoidance as well as optimisations in advance, before the physical image is realized, can thus be achieved by simulations (Haselbauer et al., 2018; Klostermeier et al., 2018). The digital replica of production sites, warehouses, transport routes, capacities and material flows could lead to an enormous increase in transparency and acceleration of processes through decentralized control (Dittmann, 2020). Platform users can use a digital twin alongside their supply chain, especially to monitor the material flows. Based on a cloud solution, data generated at various points in the material flow is collected and finally analysed. The analysis is carried out by using AI algorithms to make predictions about upcoming bottlenecks. On this basis, countermeasures can thereby automatically be initiated to avert the impending risk (Geisselbauer et al., 2020).

#### **4 Conclusions**

Based on a literature study, we have developed a framework for CoRM. In the scope of our first research question, we have described how partner management looks for data-driven B2B platforms. The interviews reveal that it is necessary to distinguish between closed and open platforms when answering this question. On the one hand, for closed platforms, the strategic fit between platform and complementor is highly important. They use specific requirement catalogues for desired use-cases. On the other hand, open platforms typically have no selection

process for complementors. Furthermore, closed platforms are often founded by incumbent firms and offer a central service for an industry (e.g., a data platform for agricultural companies). Thus, they have an exact consideration of the services they need to have from complementors, whereas open platforms only define basic requirements (e.g., data security and data privacy). However, both types try to lower barriers of entry to overcome the chicken-egg-dilemma. Concerning monetisation, subscription models are preferred within closed platforms, whereas open platforms more often use transaction-based models. CoRM must find a balance between intended lock-in effects to bind attractive complementors and the phenomenon of multi-homing, where complementors try to participate on many platforms.

Moreover, we found some important aspects regarding technology management on data-driven B2B platforms. The platform infrastructure is mostly provided by tech giants like AWS or Microsoft Azure. To enable communication and an easy exchange of data standardised interfaces (APIs) are important, especially for open platforms. The main digital technologies used by data-driven B2B platforms are IoT, Big data and AI. Among others predictive analytics and digital twins are often used digital applications.

Although digital platforms are a popular topic in the management literature and practical business applications, little research has been conducted on the supply side of data-driven B2B platforms. Our findings give insights into the management of platform service providers for data-driven B2B platforms: the so-called complementors. Our research contributes to the theory in three ways (Makadok et al. 2018). First, we have combined findings on digital platforms with findings on the management of complementors, which is only analysed in a very rudimentary way in the literature. Second, our work focuses on a specific type of digital platform, the data-driven B2B platform, for which little research currently exists. Third, we have for the first time conducted a dyadic analysis in combining first the two perspectives of the platform provider and the complementor and second partner with technology perspective in a holistic approach on CoRM.

For practitioners, we found several benefits of partnerships with complementors. First, services can be provided at much lower cost and with less effort through a platform instead of building new offerings from the bottom up. Second, there are possibilities of owning as well as sharing large amounts of customer data. Access to aggregated customer data can be a key success factor for innovation and business providers. The data can be used as input to improve

existing services and to develop new applications. However, platform providers must manage how complementors can access the platform to offer them incentives for further business potential. Thus, data sharing offers new options for value creation for all platform stakeholders. For the success of a data-driven B2B platform, it is important to have strong partnerships with several complementors and to select the right service providers for the platform. Close partnerships with complementors can also speed up the innovation process. Product and service innovation can be outsourced to the service providers. Complementors also benefit from a partnership with the digital platform. Digital platforms help them scale products and services into the market much faster with the support of the platform provider's brand value.

Nevertheless, some risks appear when one works predominantly with complementors, which are often start-ups. Start-up service providers tend to be smaller companies that have higher financial risk. Partnering with poorly performing start-ups may cause a lower quality service for customers. To be successful in the long term, platform providers must establish a working CoRM system that helps to identify the best partners. The main functions of CoRM range from simple applications, such as a support system for inquiries, to more complex applications, such as platform governance, performance tracking or fraud identification (Meffert and Swaminathan, 2017).

Because of the novelty and high relevance of data-driven B2B platforms, we have followed an exploratory research design with expert interviews combined with literature research. Although we have had the opportunity to address 14 cases out of a vast landscape of data-driven B2B platforms and complementors, our generalised assumptions are not necessarily representative. Thus, the validity of the data is limited by the relatively small number of cases. In addition, concerning the validity and quality of the data, general limitations of the expert interviews must be identified. Our exploratory study is to be seen as a starting point for CoRM for data-driven B2B platforms.

This study provides initial insights into the subject area of CoRM. Conducting further case studies in this field (potentially with a greater focus on the technology of data-driven B2B platforms) and offering deeper insights into concrete methods of CoRM would complement this study. The inclusion of customers' perspectives into the analysis could also help us gain a deeper understanding of platform relationships. Complementors are often start-ups; thus, literature in the field of entrepreneurship is also a possible area of analysis.

The focus of our study is the data-driven B2B platform. A comparison of our findings with B2C platforms, on the one hand, and transaction platforms, on the other hand, might comprise an interesting additional field of research. Finally, the relationships between complementors, which might be cooperative and competitive, are also worth considering in the future. All in all, we are convinced that the topic offers high potential for future research.

### **Abstract**

The increasing rates of diet-related health problems remain a significant social issue of today, and even more in the incidence of the Covid-19 pandemic. However, even when the pandemic subsides, it is still vital to maintain healthier lifestyles, particularly concerning the choice of healthy food. Despite people's inherent consciousness of the positive impacts of healthier food choices, there is still a need to stimulate further and encourage consumers to manifest the desired behaviour. Over the past years, evidence is growing on the use of "nudges" – a concept in the framework of nudge theory in behavioural economics, aiming to induce behavioural changes among people and consequently counter diverse social issues. Nevertheless, as the concept is still in its infancy, a paucity of knowledge remains as to the types of nudges empirically examined in the foodservice sector, their efficacy in in-

store and online retail environments, and the subsisting concerns needed resolves in future research initiatives. In response to this, a comprehensive literature review was conducted. Following the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) guidelines, about 80 journal articles published from 2014-2021 in the Scopus and Web of Science databases were reviewed. The selection covers research papers that experimentally assessed the nudge as behavioural intervention in the healthy food choice. Key findings reveal many nudges tested in the existing literature and have proven their effectiveness in healthy consumer choices. Nevertheless, specific population characteristics may influence the effectiveness of the intervention. For instance, verbal prompts, internal commitment devices, and nudges with hedonic attributes eliciting entertainment and enjoyment seem more promising for children than adults. Meanwhile, descriptions (nutrition labelling), placement (proximity/visibility), and visual enhancement nudges work effectively on the adult population in real-world or lab-based experimental setups. The review findings likewise recognize the scarcity of knowledge on the use and effectiveness of nudge interventions in virtual environments. Hence, with the increasing relevance of off-site shopping, the examination of nudges towards healthier food choices among consumers is a promising research direction. Extant studies have suggested further investigation of healthy food nudging interventions in diverse environments (i.e., low-income countries and vulnerable population groups) to offer more conclusive and complement extant findings. Indeed, the problems associated with a healthy diet affect the health of society and, consequently, economic performance. Nudge interventions are simple, effective, and low-cost tools that can have a very invasive positive effect on consumers within healthier consumer choices. Acquiring comprehensive knowledge would be relevant to various online and offline enterprises in promoting healthier food choices among consumers and together support public policies to mitigate health-related issues in societies around the globe.

**Keywords** – Behavioural Economics, Consumer Choice, Food Choice, Healthy Eating, Nudges

**Paper type** – Academic Research Paper

## 1 Introduction

According to World Health Organization (2021), 39% of adults and more than 340 million children and adolescents are overweight or obese in 2016. As the risk of diseases directly relates to obesity, this aggravates today's health and social issues. Encouraging people to make healthy food choices plays a vital role in ameliorating obesity and other weight-related issues (Hussain et al., 2020). The Covid19 pandemic makes this issue even worse; hence, accruing the seriousness of promoting a healthy diet. The World Health Organization (2020) advised some policy interventions that governments around the globe can adopt in promoting

a healthy diet. These include creating awareness in consumers, supporting a point-of-sale information, encouraging children to acquire and maintain a healthy diet through different means through education, school programs, and interventions.

Nevertheless, Kroese et al. (2016) argue that changing behavioural patterns can transpire by using unobtrusive strategies (i.e., environmental adjustments) while retaining autonomy on consumer decisions. Specifically, in eating behaviour, one aspect of the consumer decision process is primarily guided by cognitive biases and simple cues in the environment. Therefore, understanding the underlying behavioural mechanisms and the influence of environmental cues can offer a rationale for policymakers to design behaviourally informed policies and consequently address health-related problems.

A nudge is an emerging form of behavioural intervention that enfolds any aspect of the choice architecture. Its basic principles brace on changing an individual's behaviour by making it predictable, retaining freedom of choice while voiding economic incentives (Thaler & Sunstein, 2008). Its growing application attributes to the ease of its implementation and cost-effectiveness. Its usage is apparent in diverse disciplines, specifically as solutions to health, environmental, pension savings, and even problems in everyday life. However, a crucial debate remains as regards to its transparency, efficacy, and persistence effects (Marchiori et al., 2017).

The diffusion of technology in everyday life and the booming movement towards online shopping accordingly increases the relevance of "digital nudging." One example of its application is enriching user interface design elements to influence users' choices in the digital environment. Moreover, it raises pressing questions about the applicability, translatability, and efficacy of nudges from the physical to virtual environments. Hence, owing to the growing evidence on the effectiveness and the low-cost nature of nudge interventions in the diverse milieu, this paper comprehensively reviews the existing interventions that influence consumers' choice towards healthier food in offline and online environments. As to the authors' best knowledge, no thorough inventory of nudges and collation of its efficacy in physical and online environments exist in the retail and foodservice sector. Also, extant empirical initiatives have suggested examining the combined effects of nudges; nevertheless, knowledge-base on which types of nudges to combine or applied that may offer higher efficacy on specific environments is still scarce. Hence, the study aims to secure the knowledge on

the existing interventions in the framework of nudge theory in behavioural economics empirically examined in a healthy food choice context. Under this core aim, we proposed the following research questions:

- What are the types of nudges empirically examined in physical and virtual settings?
- Which scenario and health-related concern that "nudges" addressed?
- How effective are the nudges in directing the desired behavioural outcome?
- What are the key issues and future research directions that the extant literature proposes?

Nudge interventions are simple, effective, and low-cost means that can have a very invasive positive effect on consumers within healthier consumer choices. Acquiring comprehensive knowledge would be of relevance to various online and offline enterprises in promoting healthier food choices among consumers and together support public policies in the pursuit to mitigate health-related issues in societies around the globe.

## 2 Methodology

The systematic literature review process anchors on the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) guidelines (Page et al., 2021). Figure 1 reflects the PRISMA flow diagram, which outlines the sequential actions undertaken to identify, screen, and include research articles in this review. Apropos to the thematic focus of this review paper, the researchers have chosen a set of relevant keywords before the search query in the scientific databases. By reflecting on the researchers' present knowledge and exploratory perusal of some research articles utilizing nudges as a behavioural intervention in the food and health-related fields, it shows that "nudge," "choice architecture," "behavioural economics," and "nudge theory" are commonly cited keywords. Subsequently, we set up a structured search query by infusing logical operators "OR" and "AND" along with the initial keywords identified (*search string: "nudge" OR "choice architecture" OR "behavioural economics" OR "behavioural economics" OR "nudge theory" AND "food"*). We launched the query in the worlds' leading scientific databases, namely the Web of Science and Scopus database. Besides, Zhu & Liu (2020) knowledge domains for meta-analysis and bibliometric studies due to the availability, quality, and extensive coverage of academic research papers. The

search query resulted to:  $n^{WOS} = 12,994$  and  $n^{Scopus} = 35,238$  scholarly papers. We further filtered the result and excluded scholarly works published before 2004, articles not published in journals, articles not in the economics, health, or non-food domains. In so doing, it substantially reduced academic articles to 719 ( $n^{WOS} = 319$  and  $n^{Scopus} = 400$ ). Then, we excluded 57 duplicated records leaving 662 articles in the screening stage.

The screening of the research articles followed specific inclusion criteria to ensure that the identified articles align with the core objective of this paper. These include: 1) a discourse on "nudges" as behavioural intervention; 2) an experimental (field/laboratory/online) assessment on the efficacy of nudge intervention; 3) nudge application towards the choice of healthy food. The evaluation focused on the titles and abstracts of the selected articles and was performed manually among the researchers. This procedure further discarded 562 articles, hence, sought 100 papers for retrieval. Nevertheless, 7 of the papers were inaccessible, leaving 93 of them for full reading and analysis. We extracted data on the following: the year of publication, source reference, country of origin, underlying health/food-related concern of the study, type of nudge intervention, type of respondents (study subjects), type of experimental scenario/setup, and the nudge efficacy in general. However, while still bearing in mind the screening criteria, 13 more papers were not within the scope, hence excluded. In total, 80 research articles were thoroughly reviewed and scrutinized for any issues or concerns which may need to be addressed in future research. The extracted data were manually encoded in Microsoft Excel, and the descriptive analysis for some metadata was performed using IBM SPSS Statistics version 23.

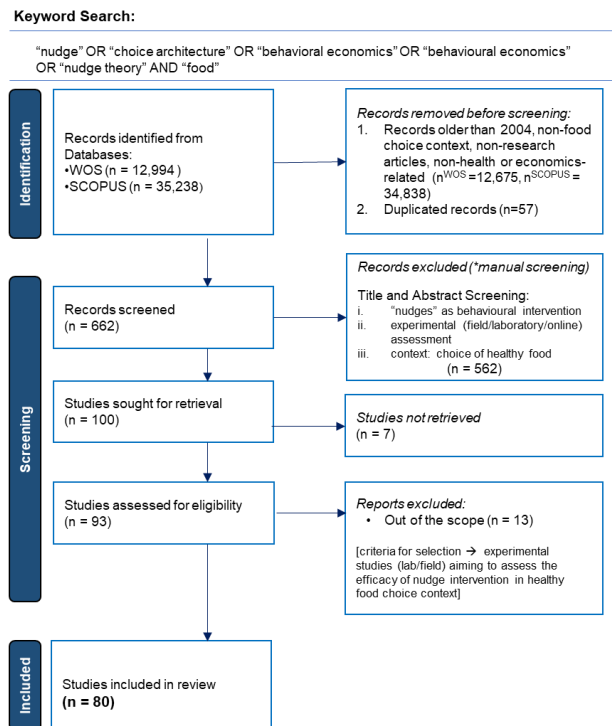

Figure 5. Systematic literature review process adopting PRISMA Guidelines

### 3 Results and Discussion

#### 3.1 Basic profile of articles

The study comprehensively reviewed 80 research articles after passing through the prescribed eligibility and screening criteria. The majority were published from 2018-2020 in top-tier international journals such as *Appetite*, *Public Health Nutrition*, *Journal of Behavioural Nutrition and Physical Activity*, *BMC Public Health*, and so forth. The analysis also reveals that the scholarly works pervade cross-cutting research disciplines, ranging from nutrition and dietetics, health, business economics, behavioural sciences, etc. However, the studies mainly originate and concentrate on the world's most advanced economies, such as the United States, Canada, Netherlands, France, Italy, England, and Australia. Table 1 shows the basic profile of the reviewed articles.

### 3.2 Types of nudges in the food choice context

A crucial inquiry of this review paper is to specify the different type nudges with empirical support in the physical and virtual environments. The findings reveal the diverse forms of nudges examined in the existing literature. Hence, we categorized and described nine major nudge categories with examples (Table 2). Prompts, descriptions, presentation, and placement nudges are predominantly investigated. These nudges seem to encase information and perceptibility cues that enhance the salience of targeted products and consequently stir people to enact a desired behaviour. It also observed that scholarly works combined different types of nudges and examined their effects on the choice and consumption of healthy food in natural/field settings. Meanwhile, the impact of nudge interventions is commonly observed among the adult population targeting diverse diet-related issues. Studies also considered the children and adolescent groups in promoting healthy diet suchlike increasing fruit and vegetable consumption in school canteens and cafeterias. The importance of imbuing a healthy diet in the early life stages could establish the foundation for a healthier lifestyle and can promote overall health during adolescence and adulthood.

### 3.3 Nudges and Targeted Health-Related Concern

Conversing about a "healthy diet" is notably a broad subject matter. Besides, ascertaining a healthy versus unhealthy diet can be challenging due to individual-level and context-specific differences. Therefore, we refer to the World Health Organization (2020) as it delineates the basic principles of a "healthy diet" into several facets, including i) balanced energy intake with energy expenditure (calories), ii) consumption of fruits, vegetables, legumes & whole grains, and iii) limiting sugar, salt, and fat intake. In light of these, the in-depth review reveals that 25 papers confer the improvement of diet in general, while 55 studies address a specific aspect of a healthy diet. At the fore tackles the surplus calorie intake from out-of-home consumption and discretionary food (snacks) (n=26). Another pertinent area of concern focuses on the inadequate consumption of fruits, vegetables, and fibre-rich food (n=22). The interventions considerably targeted the children population as fruit and vegetable consumption seems lower than the defined standards (Bucher et al., 2014; dos Santos et al., 2020; Mariel Marcano-Olivier et al., 2019; Mistura et al., 2019). Meanwhile, only a few studies (n=7) have explicitly applied nudges to counter excess salt, fat, and sugar intake.

Table 2. Categorization of nudges and examples

Category	Description/examples	n
Prompts	Verbal/written persuasive reminders, social norms, commitment devices & signages	26
Descriptive	Product labelling (nutritional labels)	21
Presentation	Changing how targeted products appear (packaging, different shape of food, portion size, printed plates, other artworks, and visuals)	18
Placement	Placing target products based on proximity or product visibility and other location and positioning parameters	17
Availability	Increasing availability and variety of products. It also captures financial/cash-back incentives.	10
Contrast	Changing visual brightness/contrast, frames or boxing on menu items, arrows to increase the salience of target products	11
Default	Pre-set options for decision-makers	10
Semiotics	The use of icons, marking of traffic lights, emoticons, naming logos, other marks	5

\*n – number of articles

### 3.4 Scenario Specification and Experimental Set-up

The analysis bares many studies assessing the efficacy of nudges abetting the choice and consumption of individuals towards the targeted food items in the dining points in the school environment (Figure 2). Additionally, the nudges are also applied to in-store food retail settings, encompassing conventional supermarkets, grocery, and convenience stores. Most of the investigations are orchestrated in the field (real-life) setting, permitting data extraction of naturally elucidated behaviour from the study participants. The natural setup is advantageous as it suffices and enriches the external validity of the research results. Nevertheless, en masse with all other field experimental setups, it is clear that confounding factors are hard to control and may influence the experimental outcomes. Also, the studies suffer some practical issues, including intricacy in measuring outcome variables, sample representation issues, Hawthorne effect, and other logistical issues. Notably, only a few papers have applied and experimented with nudges in online or virtual environments, despite the progressing online presence among retailers in the foodservice sector.

Figure 6. Number of articles based on scenario and type of setup

### 3.5 Efficacy of Nudge Interventions

Further analysis detects the prevalence of empirical results in support of the efficacy of nudges in directing consumers to choose healthier food alternatives, may it be in the context of out-of-home food consumption or purchases in retail food outlets (Table 3). Descriptions (labelling) and verbal/written prompts are just some of the nudges frequently demonstrating significant effects on behavioural

outcomes in both laboratory and field environments. For instance, Cioffi et al. (2015) findings indicate an increase in sales of low-fat and low-calorie foods in the university setting, following the use of descriptions such as calorie and nutrition labels. Dallas et al. (2019) also found that labels with calorie information effect when placed to the right of food, but they have a significant effect when placed to the left. Many other studies conform to the efficacy of descriptive nudges in improving diet in general (Byrd et al., 2018; Colson & Grebitus, 2017; Gustafson & Prate, 2019).

Nevertheless, Castellari et al. (2018) assert that nutritional information may not work if not linked with other interventions. In the online environment, the usage of descriptive nudge is also evident; however, a few recent studies documented the affirmative impact of the nudges in the online setting across all reviewed papers. To cite a few, the online-based study of Gustafson & Zeballos (2019) indicates that participants without access to calorie summation significantly underestimated the number of calories they order. Another is pre-filling a shopping cart with healthy foods, which has led individuals to make healthier food choices (Coffino et al., 2020).

In general, one can apply nudges to different population groups (i.e., children, adolescents, adults, and elderly); however, we noticed some patterns in how the studies design and impose the nudges. Notably in children population groups, nudges confirming its effect somehow hold hedonic attributes, enabling targeted food items to be more salient and appealing for them (Hubbard et al., 2015; Kleef et al., 2014; M Marcano-Olivier et al., 2019; Mistura et al., 2019). The work of dos Santos et al. (2018, 2020) even argues the significant effect of the conventional labelling approach among children despite evident efficacy among adults. The setup of Cravener et al. (2015), which presented vegetables in boxes with cartoon characters, contained stickers, which could then be exchanged for prizes, have all been shown to stir healthy food choices among children. Commitment devices Samek (2019) and conditional incentives (List & Samek, 2015) equally aid children in stirring their choices towards the targeted food products. Furthermore, the work of Olstad et al. (2014) and Thunstrom (2019) recognizes the heterogeneity in the effectiveness of behavioural economic interventions (i.e., nudges) due to complex and context-specific issues. For instance, the level of efficacy of labelling as used by some studies is contingent on placement (Dallas et al., 2019; Manipa et al., 2020), order of information (Gustafson & Prate, 2019), type of information (Sogari, Li, Lefebvre, Menozzi, Pellegrini, Cirelli, Gómez, et al., 2019), or presence

of information trade-off (Gustafson & Zeballos, 2019). Meanwhile, individual-level characteristics viz restrained vs. unrestrained eater (Tonkin et al., 2019), dining frequency (PolICASTRO et al., 2017), indulgent vs. health-conscious (OTTO et al., 2020), low vs. high cognitive load (CARROLL et al., 2018), socioeconomic class (NAGATOMO et al., 2019), and gender (MOHR et al., 2019) found to matter as well for other types of nudges.

The use and simultaneous deployment of two or more nudge interventions bring forth better behavioural outcomes. The evidence from the work of Vermote et al. (2020) which probe the effect of food label in combination with semiotics and social norm nudges has significantly directed behaviours towards purchasing fresh fruits. The empirical work of Hoenink et al. (2020) also endorses some synergetic effects of nudges in combination with traditional interventions (i.e., pricing), resulting in to increase in healthy food purchases. Another remark from (Caspi et al., 2019; Castellari et al., 2018) emphasizes the need to integrate behavioural interventions as findings refute behavioural effects when an intervention is singled out (e.g., solely increasing food availability). Following this integrative approach allowed the nudges to exhibit some persistence effects lasting 11 to 12 weeks (Velema et al., 2018; Vermote et al., 2020). Bearing this may address the shortcomings acknowledged from the existing studies ascertaining a nudge effect yet only examined in a limited period.

#### 4 Extant Research Concerns and Future Research Directions

The analysis of the literature acknowledges some of the concerns noted in previous research. Based on them, the following research directions are proposed:

- i. *Sample size and generalizability.* Several researchers cautioned on generalizing their findings. One reason is the inadequate sample size; hence, they suggested that the replication of the experiments should involve a sample size adequate to represent a specific population. Also, the population under investigation stems mainly from advanced economies. It is worthwhile to examine the interventions in the less developed world as context-specific elements (i.e., culture, socio-demographic characteristics, diet composition, food neophobia, etc) may bias the efficacy of nudge interventions. At the same time, further research can clearly define target groups (i.e., specific age categories or socioeconomic class) and find a suitable nudge intervention for them.
- ii. *Long-term studies and persistent effects.* Researchers cannot detect the long-term effectiveness of nudges due to a shortage of time and resources. Some studies also acknowledged one-shot observation of behaviour, limiting the observance of continuance behaviour when the treatment period stopped. Hence, it is suggested to conduct experiments for extended periods and evaluate nudges' long-term effects. Another concern applies to the adoption of nudge intervention by the food service management after the experimental period. Although the nudge effect was observed in the field, it was not confirmed if the management of foodservice outlets continued to apply the nudge interventions. Hence, ascertaining its lasting effects cannot be verified.
- iii. *Addressing experimental setup issues.* Some experiments were unable to mimic real-life environments and could not capture actual consumption behaviour among study participants. For instance, the setup solely draws out hypothetical choices. A disregard for product prices and brands eventuates, and participants did not manifest actual purchase towards the targeted products. In enhancing the external validity of investigations, the examination should be under cognitive strain and the absence of price advantages. Recording the actual consumption of the targeted product can also show meaningful

findings as the impact of healthy diet proceeds from actual consumption rather than food choice. It is also necessary to analyse the compensatory behaviour of consumers. Meanwhile, *it is appropriate to ensure a holistic approach in linking the physiological impacts of labelling, testing different types of discounts, separating individual interventions, and exploring the nature of nudge and how it works regarding healthy food and how it works when it comes to unhealthy food.* Other measures to evaluate the effects of nudges may focus on using an index (e.g., Healthy Eating Index) or nutritional values. For descriptive (educational) nudges, it is important to find out what type and how much information work concerning healthy food consumption.

- iv. *Individual-level characteristics, perceptual and cognitive biases.* Findings reveal that although nudges can prompt a behavioural change in general, the effects vary depending on individual-level characteristics such as dietary habits, personality, gender, etc. Meanwhile, individuals react differently to various stimuli in the environment. Hence, it is crucial to consider individual-level characteristics, including perceptual and cognitive biases of the population and their impact on decisions.
- v. *Confounding factors in real-world environments.* Although research experiments implemented in natural (field) environments may demonstrate higher external validity, it cannot be ignored that exposure to confounding factors is higher. Hence, future research must take extra precautions to control these factors and be highly considered during the experimental setup to minimize the possible spillover effects.
- vi. *Replication of studies in other (virtual) settings.* The literature analysis indicates many studies utilizing nudges in the physical environment. However, with the increasing online presence and digital transformation in the retail and foodservice sector, it is equally necessary to assess the efficacy of nudges in the online world. Stakeholders in the academia, the public, and private sector must address healthy diet in multiple channels in the light of technological and social changes.
- vii. *Combined effects of nudge interventions.* Scholars argue that combining different types of nudges can result in better behavioural outcomes.

Given this, future research initiatives can go through the same and validate extant findings. It is also interesting to isolate the level of influence of each nudge within the amalgamated intervention.

## 5 Conclusions

The comprehensive review reveals that several types of nudges have been studied in the existing literature, specifically in the context of retail and catering services. These include verbal/written challenges, descriptive, presentations, location, availability, contrast, background, and semiotics. Interventions focus primarily on aspects of a healthy diet, such as balancing calorie intake and increasing fruit and vegetable consumption. Previous empirical work offers positive and significant support for incentives to encourage healthy food choices in the physical (field) area through online environments. This suggests that small changes in the environment have appealed to consumers and triggered shifts in behaviour while maintaining autonomy over their decisions. However, further research is still needed to increase the generalizability of the findings for the theory of consumer behaviour, to address existing problems with experimental settings and confusing factors, and to verify the lasting effects of plucking in both physical and virtual environments in the retail and foodservice sector.

### Abstract

Knowledge plays a crucial role in enhancing the quality of information system (IS) investment decisions. This study aims to explain which and how knowledge-related factors contribute to strategic alignment in IS investment decision-making. We conducted a narrative literature review of 32 papers and applied image theory to develop a conceptual model. Our results show that business understanding and shared domain knowledge are central to aligning strategic IS investment decisions. In addition, other factors enhance IS alignment, namely IT knowledge, education, awareness of impacts, system requirements, intangible benefits, IT governance, knowledge of justification methods, and metacognitive experience. Scientists might use this study to operationalize quantitative research about real decision-making, while practitioners might improve their decision process and seek suitable training thanks to this study.

**Keywords** – Knowledge, IS investment decision-making, IS alignment, IS adoption, Image theory

**Paper type** – Academic Research Paper

## 1 Introduction

Investment decisions about IS/ICT assets, human resources, and IS capabilities (further IS investments) can substantially affect firm performance (Schryen, 2013). IS investments may increase the strategic IS alignment in an organization. Also, IS alignment (Chan and Reich, 2007) and IS investments (Sabherwal and Jeyaraj, 2015) positively affect firm performance. However, successful IS alignment remains a significant challenge. The KPMG's CIO survey (2018) found that 55% of companies are moderately or worse effective in "aligning IT and business strategy," and 68% are moderately or less effective in "relying upon an overall digital vision to guide decisions" (KPMG, 2018, p. 20). Similarly, Deloitte's global CIO survey (2018) indicates that IT business alignment is uncommon: "only 52 percent of baseline organizations have a technology investment decision-making process jointly owned by IT and the business, and only 35 percent have a clear process for prioritizing IT investments" (Deloitte 2018, p. 25). This could indicate existence of a research-practice gap.

Misaligned IS investments could be prevented during the decision-making process. According to Salge et al. (2015), two types of IS investment decisions occur during an IS investment process: (1) a budgetary decision (e.g., Kobelsky et al. (2008)) about the overall IS investment budget (allocation stage); (2) the IS solution decision (adoption stage). We focus only on decision-making in the adoption stage, which reaches from investment problem recognition to authorization (or rejection) of an IS investment project (Mintzberg et al., 1976; Malichová and Miciak, 2018). If the resultant IS solution supports the business strategy, goals, and needs, it is deemed strategically aligned (Luftman et al., 1999)

Understanding factors contributing to alignment during the IS investment decision-making process might prevent IS misalignment, failed IS implementations, and wasting resources (Tamm et al., 2014; Gerow et al., 2015). Moreover, recent literature (Baker and Singh, 2019) encourages studying IS misalignment on the process level, improving the decision-making practice in

organizations. Therefore, it appears beneficial to show which factors could improve IS alignment practices.

Knowledge management (KM) could affect the success of IS/ICT projects (Reich et al., 2014) which is increased by the high competencies of users (Djanegara et al., 2018). Also, KM could provide recommendations for IS investment decisions from the planning stage to the implementation stage (Djanegara et al., 2018). However, we have limited evidence of how specific factors related to knowledge can affect the IS investment decisions and thus increase IS alignment. Therefore, this paper will present a conceptual model of knowledge-related factors influencing IS investment decision-making.

This paper proceeds as follows. First, it introduces the theoretical background of IS alignment and decision-making. Second, the methodology describes our conceptual approach and protocol for narrative literature review. In the results, we present ten factors related to knowledge and may enhance strategic alignment of IS investment during decision-making. Then, we map the factors to a decision-making process framework, the image theory, and draw explanations for the importance of knowledge during the process. Lastly, we discuss the conceptual model, state limitations, suggest implications for scientists and practitioners, and conclude.

## **2 Theoretical background**

The following sections present the background of our research that builds on several fields of literature, namely IS alignment, IS investment decision-making, strategic decision-making, and naturalistic decision-making.

### **2.1 Information system alignment**

Strategic IS alignment can be defined as *"the degree of fit and integration among business strategy, IT strategy, business infrastructure, and IT infrastructure"* (Chan and Reich, 2007, p. 300) or as *"applying IT in an appropriate and timely way, in harmony with business strategies, goals and needs"* (Luftman et al., 1999, p. 3).

Henderson and Venkatraman (1999) recognize six types of IS alignment: intellectual alignment (between business strategy and IT strategy), operational alignment (between business infrastructure and IT infrastructure), and four cross-domain types. Two of the *cross-domain alignment* types address the relationship between business strategy and IT infrastructure, including IS investments. In the

strategy execution type, the business strategy is already formulated by business management and is implemented by the IT management as infrastructure and processes inside the current business structure. The technology transformation type involves the formulation of an IT strategy (Henderson and Venkatraman, 1999). These two types shed light on the process and multivariate relationships in IS alignment (Henderson and Venkatraman, 1993). However, cross-domain alignment seems understudied compared to other types of alignment (Gerow et al., 2015). Thus, when discussing alignment factors in this paper, we mostly draw on literature about IS alignment on the intellectual level and argue that these factors might be significant on the cross-domain level.

Few studies focus purely on alignment in IS investment decision-making, and their focus is limited in detail. Negoita et al. (2013) focused on the IT role in an organization, the ownership structure, responsibility, and the motivation behind the drive towards strategic alignment. They argue that IS alignment is achieved through converging cycles of strategic decision-making. Alsudiri et al. (2012) investigated communication, project manager leadership competence, and the commitment and involvement of stakeholders. Kajalo et al. (2007) analyzed drivers, such as awareness of IS decisions' impact, the efficacy of IS management, systematic decision-making process, and business development orientation of IS management. They divided the approaches to IS alignment into four categories: ad-hoc, business-driven, consensual, and technology-driven (Kajalo et al., 2007).

## ***2.2 IS investment decision-making process***

This paper concentrates on the decision-making about IS adoption which represents a managerial process focusing on which IS to adopt (Salge et al., 2015). The object of the decision is a project proposal, which is developed, evaluated, and approved or rejected (Irani and Love, 2002).

A large proportion of IS investment literature perceives decision-making only as a selection from alternative solutions and their evaluation or justification (e. g., Ballantine and Stray, 1998; Gunasekaran et al., 2006; Karadag et al., 2009). However, decision-making is a broader concept starting significantly earlier with recognition and formulation of an investment problem. Misaligned decisions might not always be caused by selecting an inaccurate alternative but by solving an inappropriate problem. Thus, more comprehensive IS decision-making process models are based on Simon's (1960) trichotomy of intelligence, design, and

choice (Boonstra, 2003; Xue et al., 2008), which he describes as “finding occasions for making a decision; finding possible courses of action; and choosing among courses of action” (Simon, 1960, p. 1). Later, Mintzberg (1976) refined this conceptualization into six stages (in Figure 1 as rectangles) grouped by three phases (as bidirectional arrows). In the intelligence (identification) phase, (1) management *recognizes* a stimulus and (2) *diagnoses* the information about the situation. In the design (development) phase, (3) actors *develop* a solution or *search* for ready-made solutions. Then, in the choice (selection) phase, the developed or found alternatives are (4) *screened*, (5) *evaluated*, and the optimal solution is (6) *authorized*. Screening reduces the number of alternatives to a few feasible ones, which are then evaluated. Evaluation has three possible forms – judgement, bargaining, or analysis. They correspond with an intuitive, political, or rational form of the process (as in Tamm et al., 2014). After evaluation, the selected alternative is passed to authorization (Mintzberg et al., 1976). Altogether, the process of decision-making about IS adoption commences with investment problem recognition and finishes with investment project authorization. Nevertheless, its stages can repeat or be omitted (Mintzberg et al., 1976; Boonstra, 2003) during different types of IS decision-making processes (Sabherwal and King, 1995).

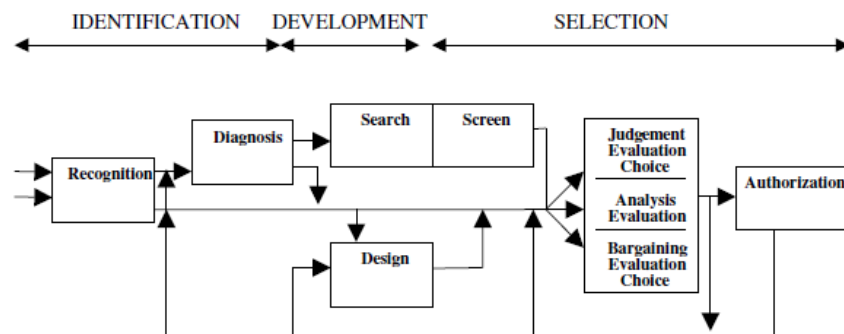

Figure 1: General model of a decision-making process  
Source: Mintzberg et al. (1976), adapted by Boonstra (2003)

Other conceptualizations closer to the IS decision-making mention refer partially to the development and selection phase as *justification* (AbuKhousa and Al-Qirim, 2012). During justification, managers set criteria for selection among the alternatives, evaluate the alternatives according to the criteria, and decide about

the outcome (Karhade et al., 2009) or defer its realization (Irani and Love, 2002), and set its priority (AbuKhousa and Al-Qirim, 2012) based on the investment portfolio. Other decision-process conceptualizations include more stages. For instance, Götze et al. (2008) mention developing a capital investment strategy, and Panagiotou (2008) includes setting organizational goals and objectives before problem recognition. These stages constraint and form the subsequent IS adoption decision-making, but they each present another decision-making process. Implementation, testing, and ex-ante evaluation can occur after investment authorization (Götze et al., 2008; AbuKhousa and Al-Qirim, 2012; Salge et al., 2015). These may provide input and constraints for later IS adoption decision-makings. However, stages before problem recognition and after solution authorization lie outside the scope of this paper.

### **2.3 Factors influencing decision-making**

Factors that influence strategic organizational decision-making and IS investment decision-making consist of antecedents, mediators, and moderators of the process on its way to a strategically aligned outcome. Tamm et al. (2014) present a comprehensive framework that divides the factors into six levels based on their origin. First is the *external environment*, which can be characterized by uncertainty (Atuahene-Gima and Li, 2004), resource munificence (Sabherwal and King, 1995; Baum and Wally, 2003), or competition (Demirhan, 2005; Xin and Choudhary, 2018). Second, *organizational characteristics* relate to structure (Baum and Wally, 2003; Shepherd and Rudd, 2014), culture (Kanungo et al., 2001), and formalization (Papadakis et al., 1998; Ranganathan and Sethi, 2002). Third, the characteristics of the *decision-making team* include tenure (Papadakis and Barwise, 2002; Goll and Rasheed, 2005), cognitive diversity (Sherer, 2004; Olson et al., 2007), or communication (Ravichandran and Liu, 2011). Fourth, *individual decision-maker* characteristics relate to her cognitive style (Hough and Ogilvie, 2005), risk propensity, and IT knowledge (Li, 2009). Fifth, *decision-matter* characteristics refer to the object and attributes of the decision, such as impact (Kotani and Iijima, 2008; Xue et al., 2008), time pressure (Papadakis et al., 1998), or uncertainty (Hickson et al., 2001; Kotani and Iijima, 2008). Sixth, and the closest to the decision, are the informational factors, labeled as *justification criteria*. These include system requirements (Rantapuska and Ihanainen, 2008; Irani et al., 2014), financial (Love and Irani, 2001; Demirhan, 2005), non-financial (Irani and Love,

2002; Gunasekaran et al., 2006), tangible (Malichová and Miciak, 2018) and intangible (Ryan et al., 2002; Ryan and Gates, 2004) costs, risks, and benefits. As a result, each factor induces different effects on decision-making regarding rationality, speed, comprehensiveness, quality, politics, or intuition (Tamm et al., 2014), and possibly IS alignment.

#### **2.4 Image theory perspective**

We needed a suitable descriptive decision-making theory for creating a conceptual model of knowledge factors influencing IS decision-making that explains the behavior of actors in an organizational environment. Therefore, the theory needed to address individual and group decision-making levels and include decision stages of justification, problem recognition, and diagnosis. Previous decision-making research has taken either an attribute-based (factor-based) approach or a stage-based (process-based) approach (Xue et al., 2008). However, this study attempts to connect both approaches with the framework by linking factors to activities of the process. Finally, we needed a theory not predicated on economic rationality because real IS investment decision-making is not always rational.

*Naturalistic decision-making* (NDM) is a discipline that opposes rational and normative theories of decision-making. Instead, NDM focuses on how experts make decisions in the natural environment, facing ill-structured problems, time pressure, and conflicting goals (Zsombok and Klein, 1997). Models of NDM assert that decision-makers rely on their experience and rarely generate and compare sets of alternatives (Klein, 2008). The most prominent NDM model is the Recognition-primed decision (RPD) model (Klein et al., 1986). Other NDM models feature Rasmussen's Decision ladder (Rasmussen, 1976), Skill/Rule/Knowledge model (Rasmussen, 1983), Cognitive Model for Situation Assessment (Noble et al., 1989), Story model (Pennington and Hastie, 1993), and Image theory (Beach and Mitchell, 1987). Naturalistic decision-making also relates to macrocognitions, such as sensemaking (Weick, 1995).

The most suitable NDM model for our research is the *image theory* (Beach and Mitchell, 1987). It is a descriptive theory of decision-making that posits that decisions result from beliefs, goals, plans, and decision characteristics. Unlike the Decision ladder or RPD, it involves evaluation of alternatives and comparison to strategy; and is not as detailed as sensemaking.

This theory applies to individual and organizational decision-making (Beach, 1993, 1990) and has already been used to explain strategic misalignment (Stephenson, 2012; Penney et al., 2019). The version of the theory for individuals presents four knowledge structures labeled as images: the value, trajectory, strategic, and projection image (Klein et al., 1993). The value image represents the decision-maker's values, beliefs, and principles. The trajectory image comprises her goals, which can be specific or abstract. Then, each goal relates to one or more strategic images with plans for attaining the goals. Finally, the projection image contains anticipated events and states for adoption or rejection of a candidate plan (Beach and Mitchell, 1987). When describing organizational decision-making, the value, trajectory, and strategic image are referenced as the organization's culture, vision, and strategy (Beach and Connolly, 2005). Culture presents the principles, norms, values, ethics, and beliefs that members of the organization hold in common to some extent (Klein et al., 1993). Culture specifies guidelines and imperatives for members' behavior and expectations, power distribution, and success criteria (Beach and Connolly, 2005; Miner, 2005). Vision consists of organizational goals and timeframe, while strategy outlines how these goals shall be reached (Beach and Connolly, 2005). The greater the similarity between individual value image and organizational culture image, the more the members agree upon appropriate goals and plans. Knowledge of organizational images forms parts of individual images contributing to the organizational decision-making process. Indeed, from the perspective of image theory, it is not the organization that makes a decision but the individual, who either acts as an agent or whose decision is combined with others' through negotiation (Beach and Connolly, 2005; Miner, 2005).

According to image theory, the process of individual adoption decision-making (depicted in Figure 2), also called *decision framing* (Klein et al., 1993), starts with recognizing a stimulus situation. This situation is framed using previous knowledge and experience (Zsombok et al., 1992), followed by evaluating potential plans in two stages. First, they are compared to the value, trajectory, and strategic images, and incompatible plans are rejected or modified. Second, the most "profitable" of the plans is selected (Beach and Mitchell, 1987). Lastly, the plan is compared to the status-quo (Penney et al., 2019). This description of the decision process corresponds to the above conceptualization of IS investment decision-making because it captures recognizing an investment problem,

appraisal of alternatives (as compatibility to images and to each other), and go/no-go decision (as comparison to status-quo).

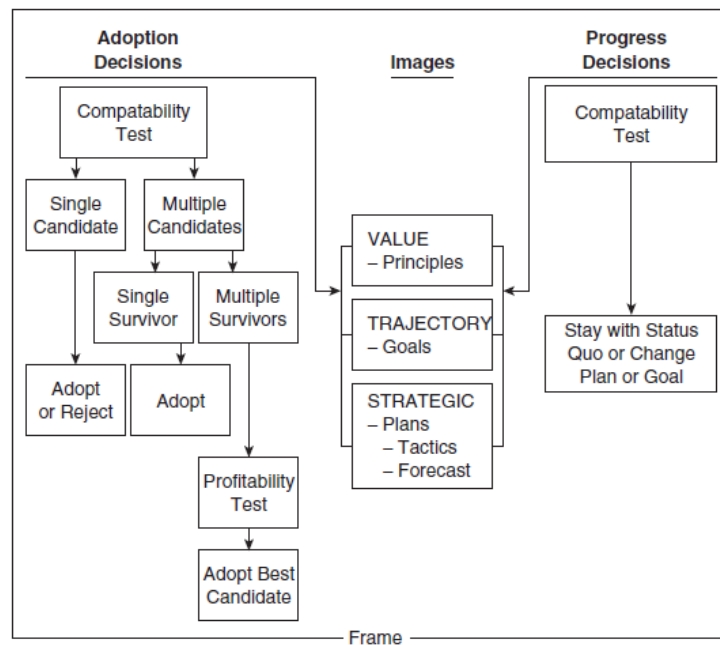

Figure 2: Decision-making according to image theory  
Source: Beach and Connolly (2005)

The image theory is suitable for our purpose for several reasons. First, it links factors, mostly as constituents of images, to actions in the decision-making process, e. g., by comparing a plan to images (Beach and Mitchell, 1987). Second, strategic alignment can be regarded as high accordance between individual and organizational images, i. e., shared knowledge (Chan et al., 2006). As image theory hypothesizes, "the greater the agreement among the members about the culture, the more agreement there will be among them about what constitutes appropriate goals and plans for the organization" (Beach and Connolly, 2005). Third, images are knowledge structures by definition, and knowledge is brought to framing a problem (Zsombok et al., 1992). The role of knowledge factors, such as education or IT knowledge, may then consist in more realistic shaping of the decision-maker's images, framing of the stimulus situation, and creating a proper projection image of IS impacts. Thus, with more realistic knowledge and expectations, the probability of selecting an aligned IS rises.

On the other hand, several limitations of image theory persist. The theory mainly focuses on decision-making on the individual level, and parallels with organizational decision-making have not been thoroughly tested (Beach and Connolly, 2005). Some of these parallels, namely between the organization's vision and the individual's trajectory image, suggest different underlying processes guiding decision-making in each case. Moreover, interactions between images of individuals within organizations and between organizations have also received little attention. Insufficient treatment of group processes and sociological phenomena in decision-making, such as groupthink, organizational politics, or imperfect communication, present an ample source of critique of the theory (Miner, 2005). Original focus on individual decision-making also subjects the theory to neglecting environmental factors (Vlek, 1987).

Another source of critique focuses on empirical tests of the theory. Authors themselves admit that research about the theory should move from laboratory studies to a more ecologically valid decision-making environment in organizations (Beach and Connolly, 2005). Further, empirical tests focus pervasively on compatibility tests, profitability tests, and progress decisions but do not address the nature of images due to a lack of satisfactory research techniques (Beach, 1998). Indeed, this theme does not seem to be resolved even today, when the authors call for the development of instruments that would measure the value, trajectory, and strategic images (Penney et al., 2019). Inability to adequately specify the concept of the image has led one of the authors to replace it with a concept of narrative, forming a new Theory of Narrative Thought (Beach et al., 2016).

### **3 Methodology**

We conducted a narrative literature review of 32 papers. The selected sample of papers represents a subset taken from a systematic literature review regarding factors influencing IS investment decision-making and IS alignment. We combined "information system investment" with the following keywords in citation registers Scopus, Web of Science, and Google Scholar:

- expenditure
- decision
- factors
- appraisal

- justification methods
- decision strategic (mis)alignment

We also conducted a backward search to reach primary sources of knowledge factors mentioned in the papers' literature reviews. The content of the papers was inductively coded and thematically analyzed to determine knowledge-related factors. Only the factors which relate to knowledge and impact IS alignment or decision quality were selected. To develop a conceptual model, we interpreted the literature from the perspective of image theory. The model was developed by one researcher and revised for accuracy by other authors.

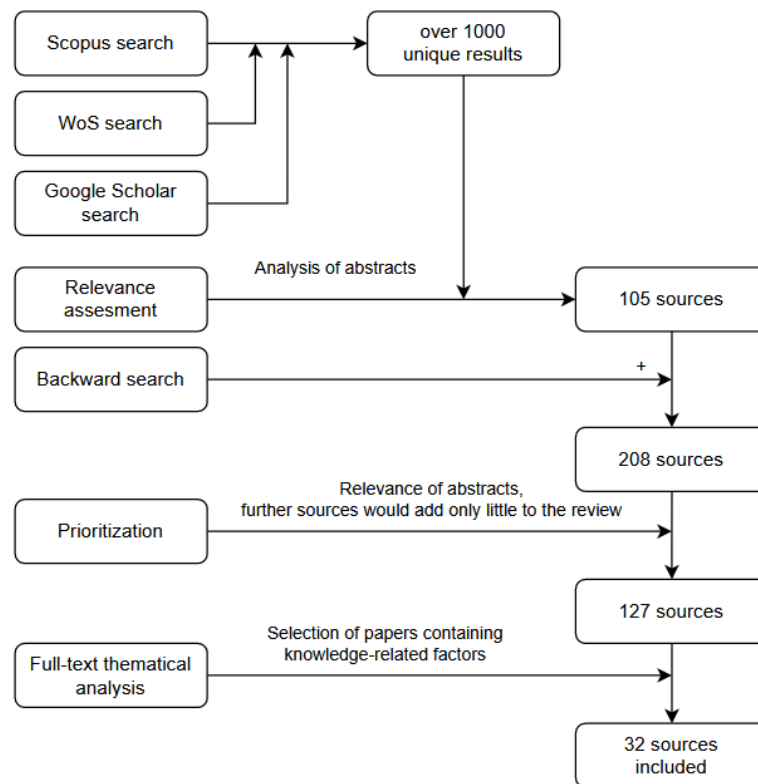

Figure 3: Literature search strategy  
Source: authors

## 4 Results

In this section, we present ten knowledge-related factors linked to IS investment decision-making. Then, we apply image theory to develop a conceptual model, linking the factors to decision stages.

### 4.1 Knowledge-related factors

We identified ten knowledge-related factors which influence strategic managerial decision-making, IS investment decision-making, or IS alignment.

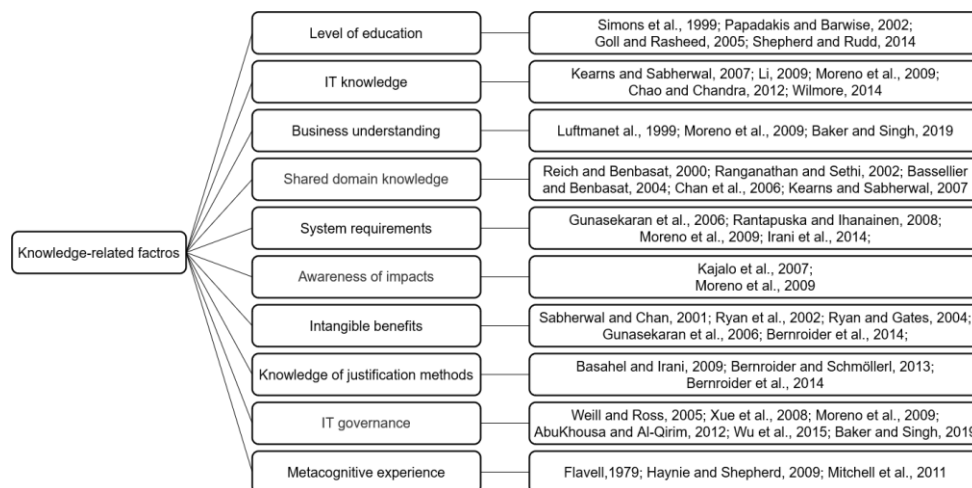

Figure 4: Identified factors  
Source: authors

The finished *Level of education* of the top management team increases the rationality and comprehensiveness of strategic decision-making, particularly during the situation analysis, generation and evaluation of alternatives, and integration of the decision with the firm strategy (Papadakis and Barwise, 2002; Goll and Rasheed, 2005). Moreover, diversity in team education is associated with higher levels of decision-making comprehensiveness (Simons et al., 1999). Besides, individual level of education, for example, the education of a CEO, has been found to increase financial reporting information in decision-making, but no other aspect (Papadakis and Barwise, 2002; Shepherd and Rudd, 2014).

*IT knowledge* of top management does not necessarily mean technical knowledge. Instead, it presents the familiarity with the value and potential of IT

(Kearns and Sabherwal, 2007), awareness of IT trends, opportunities, and risks (Wilmore, 2014), understanding of IT's contributions, and ability to define IT needs (Moreno et al., 2009). However, Wilmore (2014) views the prior experience as a necessary precondition of IT knowledge. IT knowledge enhances IS alignment through increasing organizational active IT investment attitude (Li, 2009; Moreno et al., 2009), top manager's participation in IT planning (including IS investment decision-making), an IT manager's participation in business planning (Kearns and Sabherwal, 2007). In small firms, the owner's IT knowledge enhances IS alignment directly (Chao and Chandra, 2012).

*Business understanding* is the "level of business knowledge of the executives, managers and employees of the IT area" (Moreno et al., 2009, p. 46). IS alignment increases when IT managers and employees understand their business, business environment (Luftman et al., 1999), and business strategy (Baker and Singh, 2019). Therefore, IT governance's proper allocation of decision rights is essential, as employees at lower organizational hierarchy levels might have less understanding of the business strategy (Baker and Singh, 2019).

*Shared domain knowledge* labels IT and business knowledge which is mutually understood and exchanged among business and IT managers (Ranganathan and Sethi, 2002). It includes participating in the others' key processes and respecting each other's contributions and challenges (Reich and Benbasat, 2000). Thus, shared domain knowledge comprises the aforementioned dimensions of business and IT knowledge and mutual exchange (Kearns and Sabherwal, 2007). This factor has been emphasized for its positive impact on IS alignment (Reich and Benbasat, 2000; Bassellier and Benbasat, 2004; Chan et al., 2006) and increasing rationality of IS investment decision-making (Ranganathan and Sethi, 2002). In particular, shared domain knowledge contributes to short-term IS alignment through frequent communication of business and IT managers, and enhances long-term alignment directly (Reich and Benbasat, 2000).

*System requirements.* Investment appraisal and justification criteria largely consist of requirements on the adopted IS. Technical requirements comprise functional features, compatibility, reliability, implementation (Rantapuska and Ihanainen, 2008), ease of customization and implementation time (Irani et al., 2014). Then, organizations need to assess the technological fit of the evaluated IS with the current IS infrastructure (Irani et al., 2014) and necessary further changes. Finally, security requirements include security policy, accountability, and documentation (Gunasekaran et al., 2006). Sufficient business and IT knowledge is

necessary to appropriately define these requirements (Moreno et al., 2009) and select a solution that aligns with the business strategy (Chao and Chandra, 2012).

*Awareness of impacts.* Investment justification criteria usually include costs, benefits, and risks. Awareness of the impact and risks, such as dependency on providers or security threats, was identified as a driver of IS alignment (Kajalo et al., 2007). Therefore, the IT knowledge of business managers and employees is crucial because they can be more aware of the risks of IS decisions (Kajalo et al., 2007) and understand their contributions (Moreno et al., 2009).

*Intangible benefits* are often overlooked by decision-makers (Bernroider et al., 2014), but they are valuable as they further impact tangible and financial firm performance (Gunasekaran et al., 2006). Some intangible benefits might present enhanced training or support of knowledge creation and sharing (Ryan et al., 2002; Ryan and Gates, 2004). An example of a system with significant intangible benefits is KM systems, which pertain to decision support systems. Therefore, their adoption would be strategically aligned for any strategic type by Miles and Snow (1978) (Sabherwal and Chan, 2001).

*Knowledge of justification methods*, such as the Balanced Scorecard or Utility Ranking method, enhances IS investment decision-making effectiveness (in terms of benefits, satisfaction, confidence, and easiness) (Bernroider et al., 2014). However, it is crucial not only to know but also to apply justification methods for a decision to be more effective (Bernroider and Schmöllerl, 2013; Bernroider et al., 2014). Mainly, strategic justification methods can be applied to assure IS alignment (see Basahel and Irani, 2009).

*IT governance* is a set of structures, processes, rules, rights, and responsibilities that shall ensure the alignment between IS and business goals, and the execution of IT strategy (Weill and Ross, 2005; Xue et al., 2008; Wu et al., 2015). IT governance shapes the IS investment decision-making process, prescribes its format, and allocates decision rights (AbuKhoussa and Al-Qirim, 2012) concerning actors' business, IT, and specialist knowledge (Xue et al., 2008; Baker and Singh, 2019). This way, IT governance determines who participates in decision-making and which rules they should follow, including the justification methods to be used. Well-implemented IT governance decreases the pursuit of goals different from the organizational ones during decision-making (Weill and Ross, 2005). Explicit IT governance also implies higher organization's formalization, including formal plans and planning processes, which then achieves higher levels of IS alignment (Moreno et al., 2009).

*Metacognitive experience* denotes individual reflection about one's thinking (Flavell, 1979; Mitchell et al., 2011). Metacognitive experience suggests that previous experience can evoke the belief that one knows what to do best in the current situation (Haynie and Shepherd, 2009). Higher metacognitive experience mitigates inconsistency in strategic decisions, which is considered one of the thinking errors (Mitchell et al., 2011).

#### **4.2 Conceptual model**

In terms of image theory, IS investment decision-making represents an adoption decision about adopting a new plan (a constituent of the organization's strategy image) because the decision's object is a project proposal (Irani and Love, 2002). During this process, the decision-maker first recognizes or identifies a stimulus situation. Then, she frames the situation (Zsombok et al., 1992), for which she uses *metacognitive experience* (Mitchell et al., 2011), i. e. her previous experience with similar situations, in image theory, also called repertory of problem solutions (Zsombok et al., 1992). A compatibility test follows, in which she screens the options (potential plans) to see whether they meet her standards (Beach and Connolly, 2005). This is done by comparing options, together with their projection images (expected outcomes), to her images and organizational images (Beach and Mitchell, 1987; Beach and Connolly, 2005). Several knowledge-related factors play a significant role in constituting or influencing these images.

The value image comprises decision-makers' values, beliefs, and "self-evident truths" (Beach and Connolly, 2005). First, some of these beliefs and the completeness of the value image are formed by *education* because it teaches norms (e. g., principles of working with information, ethical behavior, and normative management theories). Second, *IT knowledge* creates beliefs about whether an organization needs IT, how IS should function, and what constitutes proper *system requirements* (Moreno et al., 2009). The culture image presents the principles, norms, and values (Beach and Connolly, 2005). *IT governance* constitutes its part as it defines norms, rules, and responsibilities regarding IT management (Weill and Ross, 2005). Thus, IT governance pertains to the culture image as it shapes the decision process, prescribes criteria (standards) for compatibility tests and justification methods for profitability tests (Bernroider and Schmöllerl, 2013). The trajectory image refers to individual goals, such as getting a job promotion, while organizational vision typically determines profitability or

maximization of shareholder value as its goals. Strategic image and strategy then present the plans and tactics that the decision-maker and organization adopted for achieving their goals (Beach and Mitchell, 1987; Beach and Connolly, 2005).

Image theory posits that a higher degree of similarity between organisation members' beliefs, values, goals, and plans (therefore, according to individual and organizational images) enhances a newly adopted plan (Beach and Connolly, 2005). *Business understanding* may increase one's identification with the organization's culture, vision, and strategy (Luftman et al., 1999; Baker and Singh, 2019), thus enhancing decision-makers' capability to compare a new plan to these images. Similarly, *shared domain knowledge* increases the accordance between beliefs (i. e., value images) of decision-makers regarding business and IT principles (Reich and Benbasat, 2000; Ranganathan and Sethi, 2002). Therefore, *business understanding* and *shared domain knowledge* may enhance IS alignment by connecting organizational and individual images.

The last image is the projected image of a potential plan consisting of expected events and states after the plan's adoption (Beach and Mitchell, 1987). *Awareness of IS investment's* impacts costs, tangible and *intangible benefits*, and risks might enhance the projected image's realistic creation, and drive IS alignment (Kajalo et al., 2007). *System requirements* represent the functionality and attribute one expects from the IS (Gunasekaran et al., 2006; Rantapuska and Ihanainen, 2008; Irani et al., 2014), by which they constitute the projected image. As previously mentioned, *IT knowledge* improves *awareness of impacts* and appropriate formulation of *system requirements* (Chao and Chandra, 2012; Moreno et al., 2009) and supports realistic construction of the projected image.

If a potential plan and his projected image violate the other images to an extent (exceed the rejection threshold), this plan is screened out. If not, it proceeds to the profitability test (Beach, 1998). In this step, the decision-maker compares the plans to each other to determines the most profitable solution. She uses a choice strategy (Beach and Connolly, 2005) by selecting from the *justification methods she knows* to enhance the decision effectivity (Bernroider and Schmöllerl, 2013; Bernroider et al., 2014).

After the best option has been selected and evaluated as more desirable than the status-quo (Penney et al., 2019), its implementation might bring *intangible benefits*. These may improve knowledge creation and sharing (Ryan et al., 2002; Ryan and Gates, 2004), complementing the individual value image (e. g., by creating new beliefs about IS benefits, risks, or functioning) and form contextual

memory useful for framing subsequent decisions. The individual knowledge also augments by adopting the plan into the strategic image (Beach and Connolly, 2005).

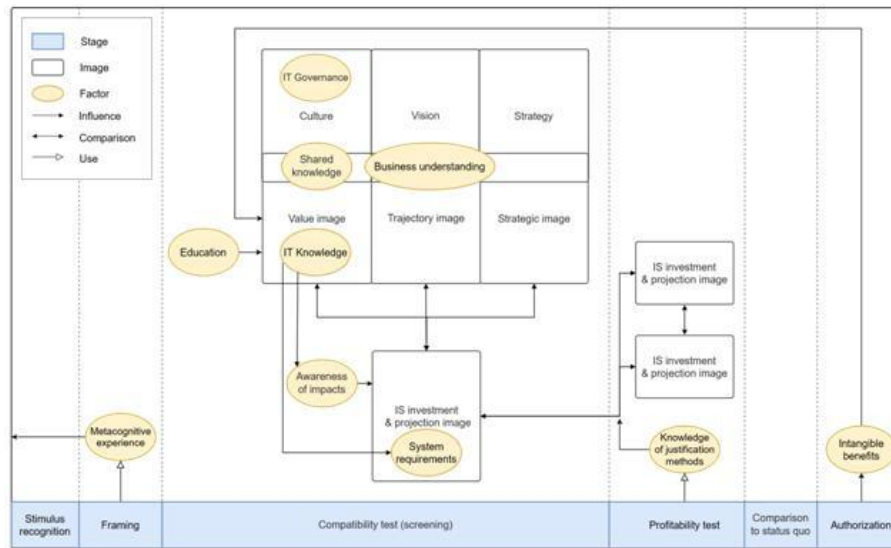

Figure 5: Conceptual model  
Source: authors

To summarize, our conceptual model shows that shared domain knowledge and business understanding are central to making strategically aligned IS investment decisions because they support the decision-maker in identifying herself with organizational values, goals, and plans. Besides, education, IT knowledge, and proper IT governance contribute to more realistic shaping of individual and organizational beliefs and expectations, while knowledge of justification methods enhances effective IS selection. Nevertheless, the whole process depends on how the initial stimulus situation is framed by previous metacognitive experience and contextual knowledge, which is, in turn, enhanced after the decision authorization by the solved situation and intangible benefits of the newly adopted IS.

## 5 Discussion

In our conceptual model, knowledge is proposed only to have a positive relationship to IS decision alignment. However, IT knowledge might, for instance, contribute to managers' overconfidence bias in decision-making (Vetter et al.,

2011) and thus, cause suboptimal decision outcomes. Similarly, the model could be enriched by other perspectives, such as unlearning or organizational learning. Especially in the case of a double loop learning mechanism (Argyris, 1982), knowledge gained after IS authorization could improve IT governance and, therefore, the rules of subsequent IS decisions. Double-loop learning is also consistent with image theory's emphasis on problem framing (Argyris, 1991).

In comparison to previous research on IS investment decision-making, this paper is unique because it combines a stage-based and attribute-based approach to examining the decision process. To achieve this, we have demonstrated another possible application of image theory. This study has implications for scientists to help them focus on investigating how knowledge and other factors can affect IS investment decision-making and strategic IS alignment. Also, our research could guide them in the operationalization of quantitative investigations. Practitioners could use the results of our paper to improve their investment decision-making process by knowingly integrating specific KM processes into decision-making. Finally, the results of this paper might contribute to the design of IS-related training or university courses.

This study is subject to several limitations. First, by choosing the narrative literature review method, we might have omitted some important studies dealing with the role of knowledge in IS investment decision-making. Second, no model or discipline could describe the decision-making process entirely (Gore et al., 2006). Image theory leaves interactions between actors unexplained and could omit other organizational aspects – aside from culture, vision, and strategy – such as power centralization in the organizational structure. Third, this study derives the quality of an IS decision from its alignment with business strategy. A longitudinal approach to studying IS investment decision-making together with decision impacts would bring more accuracy to understanding the whole IS investment process.

In continuation to this research, we gather qualitative empirical data through interviews, document analysis, and observations to explain misaligned IS investment decisions. Future empirical research of the concepts of image theory, especially the creation of, changes to, and constituents of images, would also contribute to a reliable explanation of (mis)aligned strategic decision-making in organizations. On the other hand, since image theory is no longer developed by its author (Beach et al., 2016), future research could suggest more appropriate frameworks to explain misalignment in organizations.

## 6 Conclusion

Knowledge plays a vital role in enhancing business performance through the alignment of IS investments. This study presents a conceptual model of knowledge-related factors and their influences on IS investment decision-making process grounded in the image theory. It emphasizes the importance of investigating the IS decision-making process not only as a selection process but also together with problem framing. Our conceptual model shows that shared domain knowledge and business understanding are central to strategically aligned IS investment decisions. They support the decision-maker in identifying herself with organizational values, goals, and plans. Besides, education, IT knowledge, and proper IT governance contribute to more realistic shaping of individual and organizational beliefs and expectations, while knowledge of justification methods enhances effective IS selection. Nevertheless, the whole process depends on how the initial stimulus situation is framed by previous metacognitive experience. Therefore, appropriate fostering of the identified knowledge-related factors shall contribute to the alignment of IS investment decisions.

## Abstract

In a time when society is confronted with global concerns that have the potential to fundamentally transform the economy, the underlying social structures, work, education and science, the digital technologies particularly, and technology in general play a unique role in the development of remedies, in building up economic and social resilience, and in facilitating exchanges between individuals, organisations, communities and governments. As the intellectual capital (IC) is the prominent source of organisational knowledge and the foundation of innovation, it is important to assess the research concerning the relationships between IC, technology and innovation, in order to unveil the established interdependencies. The present study attempts to systematically review the literature dedicated to the aforementioned relationship, aiming to reveal its extent, focus, gaps and trends, for the benefit of future research.

**Keywords** – Intellectual Capital Management, Technology, Innovation, Systematic Literature Review.

**Paper type** – Academic Research Paper

## 1 Introduction

Both economy and society are subject to ongoing and deep-changing, technology-based transformation. The advanced economies already harvest the fruits of their innovation strategies focused on the Industry 4.0 technologies - Big Data analytics, cloud computing, IoT, 3D printing, advanced robotics - (Rupp et al., 2021), and envision the “super-smart” Society 5.0 (Fukuda, 2020).

Meanwhile, in the context of tackling the Covid19 pandemic and its effects, information and communication technology (ICT) has become irreplaceable by enabling and supporting the management of the crisis and the aftermath,

ensuring access to data and information, storage, processing and communication infrastructure, services (e.g. e-healthcare, e-commerce, e-finance, e-government, e-learning, entertainment), communication, teleworking, etc. At the same time, increased reliance on ICT must be associated with embedded trust and security solutions, in order to avoid unwanted consequences like privacy violations, disinformation, fraud, burnout, information overload and digital divide (related to wealth, age, gender) (OECD 2019, 2020).

In the digital economy the word “technology” - referring generally nowadays to ICT enabled equipment - is never missing from both scientific and popular literature, while being positively associated in many cases with organizational innovation - when used purposefully for management processes - (Kianto et al., 2017; Cabrilo et al., 2020), performance (Coombs and Bierly, 2006; Steinfield et al., 2010; Andreeva and Kianto, 2012; Khan et al., 2019; Palazzi et al., 2020) and growth (Porter and Heppelmann, 2014). However, these findings are not always in line with other sources (Aramburu et al., 2015; Usai et al., 2021), who sometimes nuance such a conclusion by underlining that IT capital supports firm performance only in coordination with other intellectual capital (IC) components, and its value depreciates quickly because of fast technological changes and large diffusion (Bharadwaj, 1999; Huang and Liu, 2005). Orlando et al. (2020) while testing the relation between intellectual property and digital technologies concluded that they are marginally useful for IC creation and the curvilinear function indicates that beyond a certain level, undifferentiated use of such technologies can hinder value creation.

Nevertheless, as noted by Palazzi et al. (2020), today's economy relies on knowledge and knowledge assets are supplied by the IC components. Technological capability is seen as a significant constituent of a firm's knowledge base (Renko et al, 2009) and IT has a paramount role in enabling knowledge sharing processes (Mazzuchelli et al., 2021) and R&D (Nakahara, 2001).

However, according to Orlando et al. (2020), the relationship ‘IC-digital technologies’ has been scarcely studied. On the other hand, though the literature on IC and innovation appears to thrive, a 2017 structured literature review conducted by Buenechea-Elberdin rendered some conflicting findings. Overall, the research on the role of technology and its relationship with IC management and innovation in achieving organizational growth and renewal did not necessarily seem to be abundant and well structured. Furthermore, despite the decades-long existence of the intellectual capital research field, it has not been

possible to find in the academic literature a structured overview of these topics of interest. As a first attempt to search for literature concerning the association of specific concepts e.g. "intellectual capital", "technological orientation" or "technological capability" and "innovation performance" yielded no or too few results, it has been decided to keep the search terms general, as it already became apparent that the body of work regarding the relationships between these concepts is not as extensive as initially assumed.

This study set out therefore to attain a structured review of the literature concerning the association of IC, technology and innovation. Encountering a research gap, it seems worthwhile to systematically study the dedicated literature, to reveal its extent, to classify its focus and findings, and to bring out the research trends.

In order to scrutinize and analyse the accumulation of papers that cover the subjects, with the view to reveal the literature's interest, gaps and streams, the following research questions have been formulated:

RQ1: What has been the focus and the framework of scientific literature on the relationship 'intellectual capital management-technology-innovation'?

RQ2: What are the trends in the study of the relationship 'intellectual capital management- technology-innovation'?

The paper follows the structure already established in the academic literature, by presenting a review of the concepts (part 2), explaining the research method (part 3), providing the findings and discussing them (part 4), and attaining some conclusions (part 5).

## **2 Theoretical framework**

### ***2.1 Intellectual capital management***

Though the concept of IC was introduced by Galbraith in 1969 (Bellucci et al., 2020), there is still no wide agreement on either its definition, or its components (Choong, 2008). There is however an understanding that IC is grounded on knowledge resources that have the potential to be transformed into value (Buenechea-Elberdin et al., 2018). According to Santos-Rodrigues et al. (2011) IC management aims to harness the value of knowledge. Kianto et al. (2010) conveyed the view that the essential difference between knowledge management (KM) and IC is that KM is concerned with the management of information and

knowledge at tactical and operational level, while IC management is concentrated at strategic level and comprises a variety of intangibles.

Knowledge and information have a strategic importance for organizations (Bratianu and Orzea, 2010; Paoloni et al., 2020) and knowledge is the fundament of value creation (Nielsen, 2019). The reiteration of the tacit and explicit (codified) knowledge processes ensures organizational innovation, where enterprises create and share knowledge that is afterwards embedded into new products and technologies (Nonaka, 2007). Heffner and Sharif (2008) have proposed that knowledge creation and technological innovation are the outcome of fusion processes between knowledge, technologies and various organizational resources. Knowledge is found in different forms and in various organizational areas.

The tacit knowledge flow is associated with the human capital (HC). „Human capital is important because it is a source of innovation and strategic renewal“ (Bontis, 1998, p.65). Knowledge is transformed into structural capital through organizational routines, that serve efficiency and innovativeness, while information is codified into structural, explicit knowledge. Building on the model introduced by Edvinsson and Malone (1997), IC came to be traditionally seen as comprising human capital (HC), structural capital (SC) and relational capital (RC). Information and networking systems pertain to SC (Petty and Guthrie, 2000).

Kianto (2007) proposed another IC component, namely the renewal capital. Furthermore, Inkinen et al. (2017) put forward a model of IC structure which comprises seven dimensions, by adding trust capital and entrepreneurial capital to the four categories mentioned before, and by splitting the relational capital into internal and external. These resources allow a company to build new knowledge and skills, to achieve competitive advantage and to innovate, and thus to renew its knowledge resources (Inkinen et al., 2017; Kianto et al., 2010). According to Martin-de-Castro et al. (2013), SC is organizational knowledge expressed through intellectual property rights, R&D, databases, structures, processes, and systems.

Some authors argued that valorization of intellectual and information processes is the basis of profit in the new economy, i.e. through R&D and technological innovation (Quinn et al., 1996), and the use of advanced ICT can increase the value of IC (Murray et al., 2016). In the digital economy, technological competence and network competence positively influence innovation success, and both are linked to organizational technological strategy (Ritter and

Gemünden, 2004). But the impact of IC on organizational performance can be different in advanced versus emergent economies, affected by brain drain, underdevelopment of intangibles and (IC) management (Kianto et al., 2018).

## **2.2. Technological capability, technological orientation and technological intensity**

Having its roots in strategic management, technological orientation (TO) refers to an organization's propensity to acquire and employ advanced technologies to sustain innovation (Gatignon and Xuereb, 1997). Halac (2015) has proposed a TO multidimensional construct, which comprises top management capability, technological capability, commitment to learning and commitment to change.

The technological capability (TC) concept has appeared within the dynamic capabilities framework, concerned with competence renewal to adapt to a changing environment, where competition is fierce, especially in the high-technology sectors (Teece et al., 1997). TC is viewed by Campos et al. (2020) as innovative technologies prowess, consisting in acquiring, adapting and perfecting such technologies for organizational needs. Tzokas et al. (2015) describe TC as the faculty to carry out the required organizational technical functions that lead to effectiveness and efficiency, but also allows the development of new products and processes. Developing TC is linked with exploratory and exploitative learning and relies on absorptive capacity (AC) (op.cit.).

Understanding technology and its use is paramount for accomplishing organizational digital transformation (Siachou et al., 2021). However, this transformation does not happen in isolation, it is influenced by the levels of absorptive capacity and partnership interdependencies (op.cit.). AC of technology in this context defines an organization's ability to take in knowledge assets and to valorize them as dynamic capabilities (op.cit.). AC associated with TC relying on advanced technologies impacts new product development (Tzokas et al., 2015; Wua et al., 2019).

Companies with higher technology intensity are better placed to innovate (Kianto et al., 2017). Technology intensity has been defined within the ISIC rev.3 framework to differentiate between four levels of technological utilization in manufacturing industries, namely high, medium-high, medium-low and low (OECD, 2011). Smart technologies can support not only the operational management (e.g. transport and distribution, quality checks, etc.), but also

strategic tasks, like resource planning, staff selection, etc. (Gerst, 2019). Technological transformation inside an organization is usually linked to enhanced IC components i.e. structural and human (Brynjolfsson & Hitt, 2000, 2002).

### **2.3 Innovation**

Innovation is essential nowadays for a company's success and IC is a key driver of innovation (Buenechea-Elberdin et al., 2017a). Innovation has been defined as the "organizational capacity to achieve renewal in products, services, processes, strategies, management activities, etc.", which should permeate the entire organization (Nisula and Kianto, 2013, p.61). According to Gatignon et al. (2002) innovation can be understood within a structural framework that includes four dimensions, namely product complexity, innovation locus (core vs. peripheral), innovation type (generational vs. architectural, i.e. changes in subsystems or linkages between them) and innovation characteristics (incremental vs. radical, and new acquisition of competence vs. enhancing/destroying competence).

Subramanian and Youndt (2005) noted that business associated innovation has been studied from various perspectives, such as organizational knowledge, knowledge management, knowledge creation, and they reiterated the link between IC and innovation. It has been established that IC components have different impact on the types of innovative capabilities, depending on how they are combined. The innovation capability has been defined as the ability to convert knowledge and ideas into new products and processes (Lawson & Samson, 2001).

In what concerns the management of innovation, literature looks at the innovation degrees (incremental or radical), innovation types (product or process) and innovation sources (generation or adoption) (Dost et al., 2016). More recently attention was drawn to the concept of open innovation, which is understood in opposition with the closed model, as inbound and outbound knowledge flows, to stimulate the internal innovation and to secure markets for its external use (Chesbrough et al., 2006).

As Van de Ven (1986) stressed, the management of innovation is complex, as it has to organize and direct relationships between new ideas, multiple stakeholders, numerous and intricate transactions, while institutional leadership should ensure organizational strategies, culture, structure and systems that sustain innovation. While incremental innovation improves and exploits existing technology, radical innovation is disruptive, by questioning existing knowledge

and aiming for new solutions (Subramanian and Youndt, 2005). Product innovation is significantly linked to R&D in technological-intensive industries, while process innovation is more important for other sectors (Hervas-Oliver et al., 2021).

According to Verbano and Crema (2016), innovation performance is dependent, apart from the technical resources, on their management inside the company, and larger firms are favored, while small and medium size enterprises (SME) have to be more agile and to develop their IC to innovate, as they have limited resources compared to bigger companies.

Empirical research has returned mixed results on the relationship between technology and innovation (Kohli and Melville, 2018). While IT use was not found to have a significant effect on innovation processes and performance, data indicated that this association is positively influenced by higher technological orientation (Haug et al., 2021). Carmona-Lavado et al. (2013) on the other hand have found that IC components - particularly HC - influence innovation performance in technical knowledge-intensive business services (t-KIBS), namely in the software and R&D industries. Unlike professional KIBS (p-KIBS) which offer consultancy i.e. in legal, accountancy or advertising field, and which are themselves users of technology, t-KIBS are more innovative in the IT industry (op.cit.). At the same time, the effect of renewal capital and entrepreneurial capital on innovation is related to the technology level (Buenechea-Elberdin et al., 2017b). Technological diversification strongly impacts innovative capability (Quintana-Garcia and Benavides-Velasco, 2008).

### **3 Research method**

Following recommendations made by Tranfield et al. (2003), Massaro et al. (2016) in respect of so called systematic or structured literature reviews, a literature review protocol has been established, with the goal to search for the relevant literature according to defined criteria. Selected works have been collected for further analysis and data has been extracted in accordance with a structured framework, as to allow examination. The insights achieved after analysis grounded the answers to the research questions stated in the introductory part of this paper.

For this study the review protocol comprised the following inclusion/exclusion criteria:

- papers regarding the relationship between IC-technology-innovation;
- work based on thorough empirical research that concerns management and business, with the view to provide objective, reliable and generalizable results, useful for both practitioners and academia;
- articles published in academic journals, that have been subject to peer-review, to ensure accurate and valuable insights;
- studies written in English, which is deemed the language employed by academia (Bunechea-Elberdin, 2017);
- research contained in databases accessible online, published until 01 June 2021.

In the first phase, the established databases for academic purposes Scopus and Web of Science (Core Collection) have been interrogated, by using the search terms "intellectual capital\* AND innovation\* AND technology\*", the volume of returned results being comparable, 249 vs. 227 respectively, and therefore ensuring cross-checking. The search included title/abstract/key words/article and has been refined for the categories: management, business, economics, social sciences multidisciplinary, computer science. A keyword search on Scopus, using the predefined terms "intellectual capital", and its components "human capital", "social capital", "relational capital", "organizational capital", as well as "knowledge management", "technology", "innovation" led to further narrowing the results to 178 entries.

In the second phase, abstracts of the identified articles have been checked individually, and 38 articles have been retained from the Web of Science (WoS) collection, and 32 from Scopus, for further full text examination. 17 documents have been encountered in both lists. In the third phase, the scrutiny has extended to sources identified in the references of selected works. In the final phase, a total number of 35 documents have been included in the list of studies to be analysed for the systematic review.

From this sample data for analysis has been extracted according to the following framework: publication year, author(s) name, article title, journal of publication, citations, author(s) country, sample country, industry, technology type, firm type, method, sample size, findings (Appendix Table 1).

## 4 Findings and discussion

### 4.1 Descriptive analysis of results

#### *Author(s) and Sample Location*

As indicated by the data, Spain is the country with the greatest number of published articles - namely 9 - on the relationship between 'IC-technology-innovation'. Second is Italy with 8 articles. In the third position is China (including Taiwan) with 5 papers. Finland, Canada and Pakistan are in the fourth position, with 3 articles each, then come USA, UK and Jordan with 2 articles each. Countries where IC first gained prominence are represented with one article each - Sweden and Denmark -, as do the newcomers Russia, Kenya, Tunisia, Colombia, Brazil, Oman, Mexico and Indonesia.

It can be concluded that the topic that makes this paper's object has been mostly researched in Europe (19 articles) and Asia (10 articles), while North America and Africa were responsible for two articles each.

Figure.1 Author(s) location.

In the vast majority of cases, researchers investigate local and regional companies. As a consequence, the same positions in top 3 based on sample location are occupied by the same three countries: Spain, Italy and China. The research focus on the local business could be due to a better knowledge of the local business environment, facilitated access to databases within local projects, and also the location of the co-authors.

### *International cooperation*

One third of the selected articles (12) have been co-authored by researchers from different countries. It can be noted that Spain is again a front runner, with 5 articles on this topic written in international co-authorship, then comes Finland. While Italy is constantly classified among the top countries in the IC discipline research, Italian researchers are represented here only with local groups of authors.

### *Specialized authors*

Spain is on top position once more in respect of authors that specialize on topics related to IC, innovation and technology, with two researchers that have jointly written 3 articles on the subject, namely Miriam Delgado-Verde and Gregorio Martín-de Castro (2011, 2013, 2016).

### *Citations*

Table 1 shows the articles with more than 50 citations (WoS/Scopus/combined).

Table 1. Most cited articles.

Year	Author(s)	Title	Citations	
			Wos	Scopus
2009	Renko, M., Carsrud, A., Brännback, M.	The Effect of a Market Orientation, Entrepreneurial Orientation, and Technological Capability on Innovativeness: A study of Young Biotechnology Ventures in the United States and in Scandinavia.	121	147
2005	Huang C.J., Liu C.J.	Exploration for the relationship between innovation, IT and performance.	-	125
2015	Tzokas, N., Ah Kim Y., Akbar H., Al-Dajanid, H.	Absorptive capacity and performance: The role of customer relationship and technological capabilities in high-tech SMEs.	92	113

2016	Delgado-Verde M., Martín-de Castro G., Amores-Salvado J.	Intellectual capital and radical innovation: Exploring the quadratic effects in technology-based manufacturing firms.	48	56
2016	Murray A., Papa A., Cuzzo B., Russo G.	Evaluating the innovation of the Internet of Things. Empirical evidence from the intellectual capital assessment.	35	42
2013	Martin-de Castro, G., Delgado-Verde, M., Amores-Salvado, J., Navas-Lopez, J.E.	Linking human, technological, and relational assets to technological innovation: exploring a new approach.	34	40
2016	Verbano C., Crema M.	Linking technology innovation strategy, intellectual capital and technology innovation performance in manufacturing SMEs.	31	40

#### *Journal of Publication*

As expected and confirmed by the analysis, articles on this topic are published not only in mainstream journals dedicated to the field of intellectual capital, but also in journals that focus on innovation and technology.

#### *Industry and Technology Type*

The selected articles cover a range of economic sectors, manufacturing and services being investigated the most. A couple of articles are dedicated to FinTech and biotechnology respectively, and one to pharma industry and agriculture each. As anticipated, the overarching technology researched is ICT, even in those cases where the generic term “technology” is used, without further specification. The intended use of the term becomes apparent only after studying the constructs utilized, when content is available. In few cases the actual technology concerned by the study is described. In only two cases the subject of research are specifically the digital technologies associated with Industry 4.0 (i.e. 3D printing, Big Data, cloud computing, robotics), and both of them have been published this year.

Figure 2. Industry sector.

#### *Firm Size and Sample Size*

The distribution of data shows that various firm types (SME, large, combination) have been investigated almost equally, with SMEs being slightly favoured. The sample size ranges from one firm (case study), to vast regional (EU) data sets.

#### *Method*

Quantitative methods have been preferred by researchers, which indicates an inclination towards achieving objective and generalizable results. While a variety of methods have been utilized, there is nevertheless a preference for the structural equation modelling, as shown in Figure 3. Qualitative methods encountered more often were case studies and interviews. A combination of quantitative and qualitative methods was used in 6 cases.

Figure 3. Method employed.

## 4.2 Research findings

With the view to answer the first research question (RQ1), concerning the focus and framework of scientific literature on the relationship ‘intellectual capital management-technology-innovation’ we could distinguish between four main streams of research:

### 4.2.1 Technology and IC management to leverage knowledge for innovation

Kipkirong Tarus and Kiptanui Sitienei (2015) larger firms are better placed in harnessing structural capital through ICT systems and increase innovativeness, unlike SMEs, which have to remain nimble to substitute for the lack of extensive resources (Verbano and Crema, 2016). A proper IT infrastructure supports better synergy between business functions and improved management processes Torre et al. (2020). ICT enables IC development e.g. by providing HC with advanced training and education capabilities, collaborative tools, networking opportunities for exchanging knowledge (Steinfeld et al., 2010). However, as stressed by Cabrilo et al. (2020), having the technological capability is not sufficient and what is important is how organizations utilize it to manage IC and create value. In addition, an appropriate IT system can be a remedy to fragmentation of knowledge, especially in the case of geographically dispersed teams (Mazzucchelli et al., 2021). Also, according to Andersson et al. (2021), harnessing the potential of advanced technologies is dependent on the organizational absorptive capacity.

#### *4.2.2. Technological capital as dynamic capability*

While referencing Gatignon and Xuereb (1997), who grounded the technological orientation as a strategic dimension leveraged to achieve innovation, Renko et al. (2009) focused their work on the technological capability, described as an organizational pledge to expand its IP and R&D, pertaining to a firm's knowledge base. Other authors defined TC as organizational endeavours to master innovative technologies (Campos et al., 2020; Wang et al., 2020).

#### *4.2.3 Technological capital to sustain innovation*

As Martin-de Castro et al. (2013) indicated, the technological capital comprises the blended organizational knowledge such as R&D and IP, connected to the activities and functions of the operational technical system, aimed at generating new products and services. Technological knowledge affects the innovation capabilities (Galeitzke et al. 2017). According to Najar et al. (2020) advanced technological capital supports open innovation (OI) by integrating external knowledge, and OI is grounded on ICT platforms that enable communication and knowledge exchange. Unlike incremental innovations, radical ones require changes in a company's technological trajectory and associated competencies (Delgado-Verde et al., (2011). However, as underlined by Delgado-Verde et al. (2016), excessive investments in technological capital are not reflected in radical innovation performance.

#### *4.2.4 Technological capital and organizational performance*

Mahmood and Mubarik (2020) stated that technological absorptive capacity (TAC) allows companies to adapt and grow within a dynamic industry context, and IC is paramount in stimulating TAC and innovation. OI enables organizations to enhance technological competences by assimilating external technologies and technological knowledge. TO positively affects performance (Masa'deh et al., 2018; Khan et al., 2019; Andersson et al., 2021) and the interaction between HC and SC is required in order to leverage innovative technologies (Cavicchi and Vagnoni, 2018). New technologies offer the tools for improved performance, enhanced knowledge management and are essential in generating value (Torre et al., 2020).

Technology intensity (TI) augments the positive effect of HC efficiency on firm performance (Palazzi et al., 2020). Buenechea-Elberdin et al. (2018), Martín-de

Castro et al. (2013) established that TI mediates the relationship between IC and business performance, as well as innovation.

The positive effect of technology is not undisputed, though. According to Usai et al. (2021), Orlando et al. (2021) digital technologies increase firm efficiency, but they can negatively affect HC and RC, through reduced interactions and standardised learning. Nevertheless, it has been also found that digital technologies such as 3D printing, robotics, and Big Data analysis are valuable for innovation up to a certain extent.

#### **4.3 Emergent research trends**

This section aims to provide the answer to the second research question (RQ2).

As Martin-de-Castro et al. (2019) have noted, despite the fact that the study of IC has approached maturity, this discipline still has an interdisciplinary nature, and its findings are not unified and undisputable. The cited authors have also stated that, since the inception of this research field, several phases corresponding to specific periods could be distinguished, namely conceptualization and business focus (1990-1999), measurement and management models, including IC component research (2000-2009) and IC as a practice (2010-2016). In this respect, taking into consideration the evolution of ICT, which is either the principle or the enabling technology studied in relation to IC, it can be concluded that the literature reviewed for our topic corresponds to the third phase.

Looking at the analytical data briefly presented in the previous section, while taking into consideration the current global economic and social setting, it can be envisaged that the research could be heading towards the study of IC, technology and innovation in various industrial settings, especially since some currently relevant ones are under-researched e.g. healthcare, pharma and green IC. Furthermore, the effect of technology advancement e.g. robotics and AI on HC, knowledge generation and innovation is still to be undertaken. The relationship between IC and innovative business models that rely on new technologies is another avenue for investigation. Finally, studies that employ new research methods that rely themselves on advanced technologies e.g. machine learning, vast data sets are expected to increase in numbers.

## 5 Conclusions

When attempting to draw some preliminary conclusions for this study, what could firstly be stressed is the need to build a more in-depth conceptual framework underlying the research on the relationship 'IC-technology-innovation', which should also be better embedded in practice, with the aim to understand how organisations actually use technology in developing IC for operational and strategic purposes. As various investigations have brought out conflicting findings, researchers should consider the fitness of the frameworks and the methodologies used, as well as the specificities of the local business context and the proper understanding of the technology concerned.

Despite the fact that many digital technologies and other ICT enabled technologies originated or are extensively employed in North America, it appears that the focus on the relationship with IC is mainly an endeavour of European and Asian researchers, therefore a large geographical area is not covered by the current research. At the same time, certain economic sectors have scarcely made the object of IC research in the proposed paradigm, e.g., healthcare, pharma, agriculture, fintech etc. Most studies have focused on general purpose ICT applications, while technologies pertaining to the Industry 4.0 framework have just started to be considered by researchers.

### **Abstract**

This research was motivated by numerous challenges of collaboration in loosely connected partnership networks and strived to propose suggestions, applicable especially for critical cross-border infrastructures. Such need was induced by the necessity of secure and uninterrupted character of their services, significant of even dangerous impacts of possible malfunctions and inherent presence of nationally specific differences. As a possible solution, we propose a conceptual model of a governing framework for such types of industrial partnerships, considering several types of their structural and behavioural aspects. In the organizational context, situation awareness was included as a physical function in the second level of the Work domain analysis framework (WDA) in a form of a qualitative knowledge-based model. Its layered structure allows interconnection of situation awareness with principles of organizational performance, cybersecurity and trust, as well as the synthesis of related joint metrics. Toward the collaborating partners, there are two main outputs from WDA framework, performance and availability. Based on the continuously shared set of momentary values of these indicators, governing level of partnering network can efficiently plan further joint steps and develop or optimize own collaborative procedures.

Methodologically the presented solution combines WDA with traditional methods and tools of system thinking into the resultant Causal loop diagram, characterizing dynamics of mutual trust among collaborating partners. This diagram can be either analysed directly or conveniently adjusted for specific cases. Its individual or team analyses can provide a useful insight into the dynamic aspects and consequences of efficient extra-organizational collaboration. Besides the optimization of joint performance, such a complex knowledge-based model can also decrease the overall vulnerability and help organizations to safely recover from undesirable effects of fast global dynamics, including, e.g., the total impacts of the ongoing pandemics.

## 1 Introduction

At first sight, the concept of situation awareness (SA) seems to be straightforward. However, a deeper consideration enlightens the complexity and wide spatio-temporal context of this phenomenon. Its main characteristics, applicable to individuals, teams or organizations, can be summarized as follows:

- The primary role of situation awareness is the support of the right decisions. From the organizational point of view, well-developed SA is useful especially for planning and fulfilment of SMART objectives on the level of executive management,
- Managerial decisions usually combine the truth-preserving deductive, i.e., knowledge-based and inductive, i.e., data-driven inference. Consequently, SA requires a firm base of valid, relevant and diversified knowledge, extended with secured, correct, reliable and consistent data.
- Real-world problems are holistic and multidimensional with numerous subjective factors, represented with nonlinear utility functions. Also, causality and a wide range of internal dynamism, are fundamental challenges, accompanying the decision making processes.

### 1.1 Situation awareness

As the overall unifying paradigm, this research adopted principles of the Maslow's hierarchy of needs (Bridgman *et al.*, 2018; Maslow, 1943), applied to the corporate environment. In such context, the crucial prerequisite for any type of

cooperation is functional organizational metabolism, representing the conversion of industrial inputs into expected outputs and expressed, e.g., in terms of productivity or, in a broader context, performance. This vital transformation is located on the ground level of the hierarchy, as it is shown in the left part of Figure 1. For effective and repeatable production, an organisation must feel secure in all its value-creating phases. This essential requirement concerns both its internal processes and external inputs, influenced by the market or environmental changes, governmental regulations or interaction with collaborating subjects. While at the first and partially also at the second level of Maslow hierarchy the organisation is mainly concerned with its own needs, all subsequent levels also assume different types of social bindings. Nevertheless, this research dealt mainly with the third level, because the performance management, widely explained in the literature (Davies, 2016; Lee and Snyder, 2017), was out of its scope. The same purposely done omission holds also the cybersecurity domain, research and scientific analysis of which is presented in (Edgar and Manz, 2017; Metcalf and Spring, 2021). Our approach, directly applicable also in WDA hierarchy, was presented in (Voracek *et al.*, 2020). Concerning the upper two levels of Maslow's pyramid it is evident that they can be added to this framework later. Both research and practice (Kenrick *et al.*, 2010; Krech *et al.*, 1962; Maslow, 1942; Uchejeso, 2019) distinctly indicate that for a standard-functioning organisation, the level of fulfilment of its own needs increases over time and its composition and scope changes.

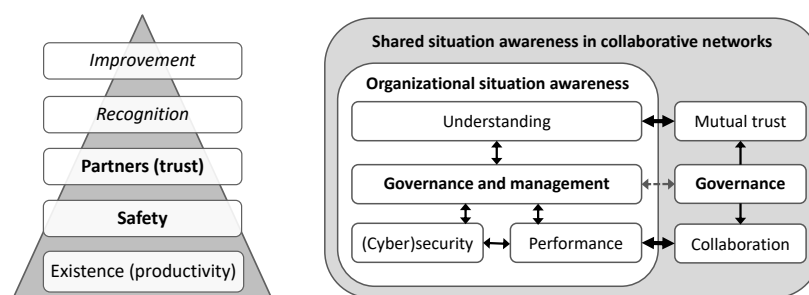

Figure 1 Maslow hierarchy and situation awareness in a wider context

## 1.2 Modelling of situation awareness

There are numerous models of individual situation awareness, derived from the seminal paper (Endsley, 1995). This model distinguishes three generic SA phases,

perception, comprehension and projection, forming the desired decisions and actions, as it is schematically shown in Figure 2.

Figure 2 Simplified Endsley's model of situation awareness

Many consecutive modifications of this originally air-traffic model were introduced to fit better to more complex and technically oriented SA models, useful for phased processing of multi-input semi-autonomous systems, typical for the Internet of things, Industry 4.0 or cybersecurity. Their characteristic representative is the Observe-Orient-Decide-Act (OODA) model, informally introduced by Boyd and further developed by (Luzwick, 2000; Lytvyn *et al.*, 2020). Extended models of individual SA can also be used for work in teams (Endsley and Jones, 2001).

### 1.3 Shared situation awareness

The stronger the scope and responsibility, the higher need for well-formalized situation awareness. This evident fact also concerns the presented case of network collaboration. As the network usually represents rather governing than managing superstructure, its role typically insists on overall coordination and harmonization, and not in the generation of core performance. Thus, the challenging situations arise when cooperating organizations need to share their specific states of SA. This is impossible in terms of the model itself because its individual architectures and parameterizations are unique and contain mainly private, formally and semantically specific information. Inspirative characteristics of distributed SA were presented in (Salmon *et al.*, 2017) and applicable shared mental models of secured situation awareness were proposed in (Gawron, 2019; Noran and Bernus, 2018).

Networking matters can be solved based on the Resource dependence theory (RDT) presented in (Hillman *et al.*, 2009; Loasby, 1979; Pfeffer and Salancik, 2003). The RDT states that an organisation can be in a specific way dependent on

resources that it does not own in sufficient quantities. Thus, it must rely on resources of another organisations, especially in critical situations. Hence, shared resources can become a tool of particular power in such communities. This theory was further developed into general models of collaboration, where the Resource Dependence Institutional Cooperation (RDIC) model described in (Hoefsmit *et al.*, 2013; de Rijk *et al.*, 2007) was adopted for this research. Figure 3 shows that it also preserves all three stages of the individual SA model, where perception and comprehension are located at level 3 and level 2 is a result of their projection.

Instead of complex metrics, the status of external collaboration is expressed just with two descriptors, the real ability to cooperate and the corresponding willingness. The former represents the level of ready to share capabilities and resources, the latter indicates the real motivation to cooperate, resulting from the trust. When analysing this pair of determinants in terms of bilateral relations, the following four possible combinations emerge:

- Correspondence in ability and willingness: efficient collaboration with added synergy,
- Correspondence in ability, differences in willingness: quantitative, mainly administratively additive form of cooperation,
- Differences in ability, correspondence in willingness: societal effort to cooperate without explicit commercial interests,
- Differences in ability and willingness: random, inconsistent collaboration with non-deterministic added value.

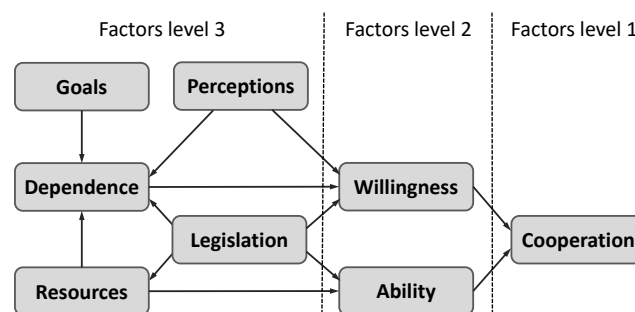

Figure 3 Schematic representation of RDIC model

The generic RDIC model for collaborating organizations must be appropriately implemented. Practically this means, that the metrics, continuously provided outside, must be centralised, regularly processed and results used for future

optimization of network performance. Similarly, the applicable model of such agile network governance must respect the local habits, actual means and capabilities. According to the literature focusing on governance (Laimer, 2016; Provan and Kenis, 2008; Raab *et al.*, 2015), there are three following concepts of network governing structures, illustrated also in Figure 4:

- Organizationally arranged and administratively linked partners share the common governance, executed by individual management structures. This option is suitable for tight global organisations or supply chains. In case of loosely coupled units, the centralized way of policymaking violates the assumption of individual independence.
- Consortium represents a federative form of governance and preserves individual levels of management. The main weakness of consortium is the identification of the most convenient way of federalized decision-making.
- Coalitional structure does not have an explicit level of governance; however, partners are informally coordinated at their own governance and management levels. While this arrangement maximises autonomy and ensures information sharing, it may have problems with implementation of common decisions.

Figure 4 Different structures of network governance

#### 1.4 Understanding and trust

The willingness to collaborate is the key enabler, determining the real scope of shared services or resources, provided by an organization to its partners. To explicitly analyse and share this crucial soft category with partners, its transparent quantification is unavoidable. Thus, we propose to express the willingness with

the two explicitly defined indicators, mutual (terminological) understanding and trust.

## **2 Terminological unification and reduction**

The notion of mutual understanding expresses the fact that the cooperating organisations understand each other both syntactically and semantically. Syntax refers to the set of related terminology, semantics concerns the overall meaning of particular concepts. Standardization of both communication aspects mitigates linguistic and cultural differences and minimisation of shared dictionary properly structures and simplifies the collaboration. This process results in the following four combination of communication compatibility, which must be early recognized, managed and optimised:

- Consensus, when syntax and semantics are understood similarly,
- Correspondence, resulting in the commonly understood meaning, expressed with different terminology. This is an acceptable and usual situation, because the definition of common descriptors for joint concepts is a technical matter,
- Conflict means that involved parties are used to present different topics in the same words. This risky situation usually requires thorough redefinition of the ambiguous concepts,
- Contrast indicates that the members of the working group cannot agree either on common issues or terminology, which usually indicates an inappropriate composition of the working group or incorrectly designed structure of the set of the modelled concepts, pairing them with inappropriate descriptors.

Another effect of the unification phase is the possible reduction of total number of shared concepts and terms. The irrelevant items can be removed, and the close ones merged. This is usually realized by the numeric clustering of initial sets of concepts (semantics) and constructs (terms), after which the resultant sets are personally analysed. The Repertory grid (Kelly, 1991; Ryle, 1975; Stewart *et al.*, 1990) can be used for these purposes.

## **3 Trust**

Trust is defined as the will to accept potential risks based on the positive expectations, intentions or behaviour of another entity (Cui *et al.*, 2018).

According to (Thanetsunthorn and Wuthisatian, 2020), trust is recognised as one of the most significant determinants of both organisational development and success. Nevertheless, increased performance, productivity, creativity, innovativeness, inner satisfaction, motivation or the willingness to share knowledge are the positive consequences of trust within an organisation (Pirson and Malhotra, 2011). From the static point of view and primarily at the individual level, it is challenging to quantify trust because of its hardly distinguishable causes and effects. Hence, this is the specificity of trust, compared, e.g., to the quality, which is also intangible but can be straightforwardly expressed as a degree of non-compliance with the explicitly given standards. Therefore, it is better to analyse trust dynamically, because in such case it evolves within interconnected feedback loops, where the role of initial causal relations is important mainly at the beginning of analysis. Trust T is frequently characterized by the Trust equation (TE) (Maister *et al.*, 2001) as follows:

$$T = (C * R * I) / O, \quad \text{where:}$$

C is Credibility, which represents the joint level of past perceived trustworthiness and expertise,

R is Reliability and can be measured as a level of fulfilment of past commitments,

I is Intimacy as a metric of ability to preserve secret or sensitive information,

O is Self-orientation, i.e., level of preferring personal benefits over the team ones.

Although trust among organisations is based on similar principles; the structure of operands in TE must be derived directly from organisational processes. A number of specifically targeted publications are devoted to this matter, analysing the possibilities and tools of forming and evaluating trust in specialised organisational structures (Aydogan *et al.*, 2014; Radomska *et al.*, 2019; Ward *et al.*, 2014). Interesting are also conclusions from the extensive review of methods and tools for trust modelling, presented in (Cho *et al.*, 2015). It states that trust is determined with close synergy between corporate governance and management, whereby the implemented strategies clearly respect the mission, values and general goals. Furthermore, trust needs to be continually evaluated, primarily through simple, unambiguous, easily understandable and transferable metrics. In addition, adequate and explicit resources should be dedicated for trust-building

initiatives and should be carried out on an ongoing, regular and personal basis. Finally, the following dimensions of composite trust were presented:

- Communication trust, in our case referring to the overall quality of network services, including, e.g., their stability, availability, timeliness, reliability, scalability, effectiveness, maintainability or bandwidth,
- Information trust, expressing the level of information sharing and its quantitative and qualitative aspects, concerning the intrinsic (accuracy), contextual (relevance), representational (interpretability) and accessibility (security) characteristics. This dimension correlates with the intimacy component of the trust equation (TE),
- Social trust: indicates the trust between individuals in virtual networks, measured with selected indicators of their interactions. This metrics concern practically all internal, performance related processes and any form of business-oriented digital networking (supply chains, critical infrastructures, global businesses) and it is close to TE reliability component,
- Cognitive trust, acquired from any kind of cognitive processes, established among partners, such as the internal learning and growth processes or personal development of network collaboration. The cognitive component of composite trust is vaguely related to credibility and self-orientation elements of TE.

Dimensions of trust can naturally evolve within the organizational structure and over time. Such levels of maturity, applicable gradually on teams, organizations and the whole network, can be characterized as follows:

- Basic maturity, implemented at the level of organizational management and including regular monitoring and control of trust reflecting metrics, derived either from the overall performance or from its specific BSC-like sectors (operations, learning and growth, customers, finances),
- Intermediate maturity, implemented at the level of organizational governance, expecting definition of trust-driving values, policies and strategies, compliant with adopted industrial standards,
- Advanced maturity, implemented at the level of network governance and assuring harmonization and optimization of all aspects of single trust dimensions.

## **2.1 Work domain analysis**

The above-presented structural elements can be further refined and integrated into the hierarchical structure of the Work domain analysis (WDA) framework, presented and applied in (Burns *et al.*, 2009; Lintern and Naikar, 2000; Wang *et al.*, 2017). WDA is the first stage of Cognitive work analysis framework (Rasmussen, 1985; Vicente, 1999), capable to modelling structure, behaviour, strategies, social interactions and competencies of complex socio-technical systems. As an architectural diagram, it deals entirely with structural elements, disregarding their specific functionality. It is the bidirectional means-end type of abstraction-decomposing architecture with two physical and three domain layers, ordered in a vertical direction. Sometimes, WDA diagram is structured also in the horizontal direction, showing different levels of decomposition, from whole to parts.

Inner nodes of vertical layers represent structural function or constraint as follows:

- Domain purpose: the main focus of the analysed system,
- Domain values and priority metrics: the key qualitative and quantitative descriptors of system purpose, either collected from lower layers or passed there from the upper level,
- Domain functions: general functions, synthesizing the system purpose based on outputs from physical functions or adjusting these functions,
- Physical functions: specific capabilities, generated or requested by underlying social or technical systems,
- Physical resources or constraints: different types of system inputs and outputs.

## **3 Methods**

The main methodological goal of this research was to review, systemize and merge the extensive and thematically heterogeneous resources to address the following topics:

- Weak situation awareness of loosely collaborating organizations,
- Lack of simplistic formalization and standardization of their daily interactions,
- Absence of common cohesive structural elements, that would guarantee an appropriate level of governance for the whole network.

Results of literature review and personal interviews indicated that the routine processing of organisational knowledge as well as sharing it with partners is not a common practice. Valuable information and practical experience were found also in extensive deliverables of EU projects, concerning mainly infrastructural resilience and containing results of workshops with stakeholders (DARWIN, 2018; IMPROVER, 2018; RESILENS, 2015; SMR, 2018). Furthermore, these resources also state that there are multiple reasons for such a closedness, from mutual procedural incompatibility to unsolved political, economic, social, technological, legislative and ecological (PESTLE) differences.

Consequently, the identification of appropriate ways of creating and developing a suitable coordination platform is crucial for harmonising synergies across the network. We propose to eliminate these bottlenecks through the following qualitative outputs:

- Structural standardization of situation awareness of single partners in the form of WDA framework, as a specification of RDIC model,
- Identification and dynamic formalization of shared trust as the key prerequisite for efficient collaboration in partner networks, using the Causal loop diagram.

Such qualitative models established the initial common understanding of the researched problem, which will be further specified and quantified. The complex networking problems, characterized as functionally and managerially independent, geographically distributed, intrinsically complex and evolving over time, are typically analysed using the System of systems framework (Cantot and Luzeaux, 2013; Kopetz *et al.*, 2016; Lane and Epstein, 2013; Nielsen and Nielsen, 2013; Thacker *et al.*, 2017; Yang *et al.*, 2009).

We, however, adopted the more aggregate System dynamic (SD) approach, especially because of its relative simplicity and possibility of straightforward computational implementation. The system dynamic approach for the compact study of complex socio-technical systems was introduced in (Forrester, 1961). This powerful framework helps to approximately evaluate the multidimensional time-varying problems involving delays, feedbacks and nonlinearities (Meadows and Wright, 2015). It combines three main modelling methods, Causal loop diagrams (CLD), System sequence diagrams (SSD) and Stock and flow diagrams (SFD), based on which it is possible to create high-quality models of the real-world problems (Sterman, 2014). Although system dynamics methodology is used mainly in the areas of economic and social sciences, it also has numerous

successful applications in natural or technical sciences. Qualitative SD models, usually in the form of CLDs, can efficiently support individual or team decisions, safely train decision-makers or validate dynamic hypotheses, concerning the temporal evolution of selected variables. Quantitative instances of SD diagrams, SFDs, generate numerical predictions, analyse internal sensitivity, evaluate and compare different external scenarios or parametrically optimize initial configurations (Morecroft, 2015; Warren, 2008).

#### **4 Results and discussion**

Besides the problem systemization, presented in the introductory part, we also designed two qualitative models, illustrating the inclusion of a knowledge-based model of situation awareness into the abstract architectural WDA hierarchy, presented in Table 1. For representational clarity, the tabular format was used instead of the more usual graphical scheme. Thus, 42 links between the adjacent layers were omitted. This model follows the proposed duality of purposes and maintains both aspects of performance/availability and trust/willingness. It starts from the physical objects, providing a secure bidirectional interface for raw data and information, altogether with the necessary drivers and enablers of performance. At the physical functional level, belonging inputs and outputs are transactionally processed in accordance with the prescribed objectives. Moreover, this level also technically implements the knowledge-based model of situation awareness, proposed as a CLD diagram in this research. Its requirements are defined and adjusted in the upper parts of the WDA model. Domain functions synthesize domain values, constrains and have a character of configurable services. Standard performance is incorporated with nontrivial functionality of organizational learning and marketing. Furthermore, this level functionally establishes principles of trusted networking. Both sets of activities are supported with organizational managerial frameworks and adopted decision making procedures. Domain purposes are monitored or controlled through a usually extensive set of concrete values, collectively derived from/or affecting domain functions.

The final presented result, dynamic model of shared trust among collaborating partners, is composed of the seven mutually interconnected and internally structured subsystems, shown in Figure 5.

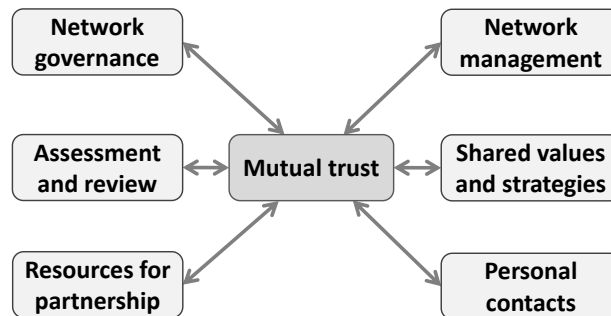

Figure 5 Subsectors of Causal loop diagram, representing mutual trust in networks

Implementation CLD thus contains 45 variables interconnected with 220 oriented and polarized edges, which form 32600 loops with the length varying from 2 to 25 edges. Such a complex chart cannot be presented as a whole, and its analyses require specialized tools. On the other hand, such purposely introduced redundancy stimulates analytical thinking and encourages team discussions. For example, the ordered horizontal histogram of the variables, appearing simultaneously in different subsystems is in Figure 6. Trust, as the key concept, is a natural part of all sectors. Similarly, the following three busy variables, Governance, Agility and Knowledge sharing, illustrate the most desirable initiatives.

Table 1 Work domain analysis of situation awareness and trust in partner networks

Domain purpose	<ul style="list-style-type: none"> <li>▫ Efficient collaboration with partners</li> <li>▫ Maximization of own performance</li> </ul>
Domain values	<ul style="list-style-type: none"> <li>▫ Dynamics, complexity, sensitivity, regulations</li> <li>▫ Level of sharing and collaboration</li> <li>▫ Predictions and projections</li> <li>▫ Risks, (cyber)security, resilience</li> <li>▫ Internal and networking workload</li> <li>▫ Trust, understanding, transparency</li> <li>▫ Performance</li> </ul>
Domain functions	<ul style="list-style-type: none"> <li>▫ Selection and analysis of relevant information and knowledge</li> <li>▫ Decision-making and execution of decisions (management)</li> <li>▫ Organizational learning and marketing</li> <li>▫ Networking</li> </ul>
Physical functions	<ul style="list-style-type: none"> <li>▫ Automated knowledge modelling across physical objects</li> <li>▫ Data and information distribution and batch processing</li> <li>▫ Operations and financing</li> </ul>

Physical objects	<ul style="list-style-type: none"> <li>▫ Cybersecurity</li> <li>▫ Data, information, and knowledge resources</li> <li>▫ Organizational, information and communications systems</li> <li>▫ Human performance drivers (knowledge, skills, experience)</li> <li>▫ Non-human performance enablers (infrastructure, resources)</li> </ul>
------------------	--

Finally, the first two levels of an unrolled set of the *Mutual trust* related loops are proposed in Figure 7. For technical reasons, the right part (causes) and left part (uses) were captured separately and thus the notation of variables in parentheses (.), meaning their second and further occurrence in the diagram, was evaluated independently on both sides of the diagram. Even such a limited cut-out shows many short and so temporally fast trust-related loops, demonstrating the dynamic fragility of this concept. Change of any of the closely neighbouring variables can affect the mutual trust and invoke the domino effect. Beyond the trust itself, also other, topologically closely variables are interrelated (parenthesised) which increases the overall trust volatility, too.

Figure 6 The most frequently occurring variables in single modelled sectors

To illustrate the overall complexity, randomly selected loop of the most frequent length 16 looks as follows and its starting and ending sequences can be found in Figure 7:

*Trust* → *Organisational learning* → *Shared values* → *Shared knowledge* → *Effectiveness of network monitoring* → *Mutual understanding* → *Networking strategy* → *Mutual social cohesion* → *Disappointment* → *Mutual commitment* →

*Agility → Network governance → Access to and sharing of information → Local performance → Shared accountability → Organizational flexibility → Trust*

## 5 Conclusions

Digital communication, process automation, purposely established coalitions of business partners or shared resources and services are sample challenging characteristics of the contemporary world. Besides their indisputable benefits, there are also related bottlenecks that must be minimised. This research reflected the need for comprehensive and coherent orientation in a rapidly changing environment by means of a flexible, transparent and shareable model of situation awareness.

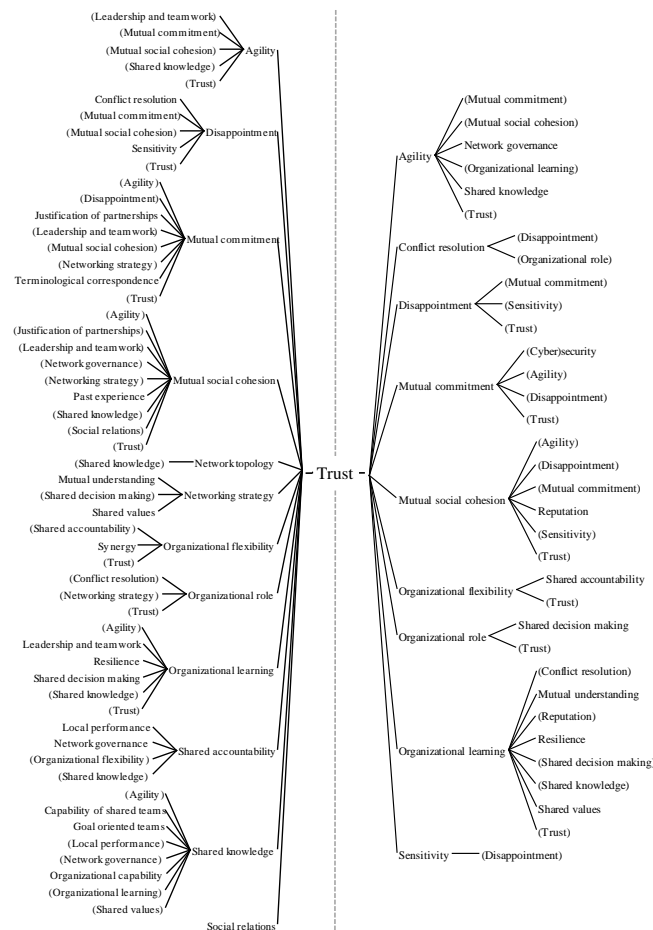

Figure 7 Partially unrolled loop of dynamic model of SA for variable Trust

The proposed conceptual solution uses the hierarchical structure of Works domain analysis as the unifying framework, within which all the key functionalities can be efficiently displaced and mutually interconnected. Such approach allows to combine highly specialized and continuously developing knowledge-intensive technologies with more or less traditional ways of business administration. Besides, this paper also distinguishes between internal and external utilization of situation awareness. The former uses any kind of perceived and contextually interpreted information for maximization of own performance, while the latter indicates the institutional availability and willingness towards the collaborators. In such case, we argue that explicit networks of repeatably interacting firms must have their own governing structure, flexible enough to maintain the desired level of cohesion and simultaneously be able to preserve the desirable level of partners' autonomy. The importance of mutual understanding of the shared terminology was discussed, too.

Thus, the presented solution systemizes and integrates a wide range of topics, substantial for loosely associated organizations. The main emphasis was given on a credible model of situation awareness interlinked with standard management and governance frameworks. Such architecture makes the vertical communication better structured, more deterministic and trustworthy. As a result, external readiness indicators of involved organizations are uniformly quantified and easy to understand. Moreover, for the governance on this extra-organizational level, a thorough trust-based dynamic model for continuous harmonization of overall interoperability was developed. It incorporates details of all presented aspects of situation awareness, divided into seven subsectors. Interactive analysis of its behaviour can identify the main sources of collaboration dynamics and determine their sensitivity and robustness with respect to external scenarios.

The originally set goals were fulfilled and viable solutions for existing gaps suggested. However, there are research limitations that need to be addressed in future research. They concern mainly general structure of suggested results, which requires further specifications. Also, the currently indirect influence of users' feedback needs to be concretized with the real data and expertise from industrial partners, namely operators of critical infrastructures. As the extension of this work, a closer mapping between strategic management platform Balanced Scorecard and governance framework COBIT (Control Objectives for Information and Related Technologies, (Information Systems Audit and Control Association, 2019) will be studied, as well as the inclusion of an explicit capability and maturity

improvement model to SA WDA architecture. Finally, the resultant model will be implemented in the executable form of a Stock and flow diagram and applied to a practical case.

We believe that the proposed hierarchical, systemic representation of common transnational, cross-sectoral and intercultural aspects of collaboration among numerous partnering organizations, presented in the context of their regular business, could support involved managers and governors in searching for appropriate internal and external policies. The innovativeness of the proposed concept lies in the fact that it tightly connects performance with trust in a structured and quantifiable manner, which can be appropriately integrated into existing administrative and decision-making processes. Chosen system dynamic way of implementation supports this approach with an intrinsically understandable representation of the modelled processes, user-friendliness, interactivity and support of teamwork. It is a natural reflection of the current digital practice where technical solutions with high degree of independence are increasingly introduced into regular managerial processes.

### Abstract

With the purpose of verifying the existence of different profiles of firms based on the level of sophistication of their PM core processes, and testing the impact of the interplay between PM supporting dimensions, namely patent strategy and organization for patenting, on the level of sophistication of PM core processes, we collected data from 82 patent management professionals. This data is analyzed with factor analysis, cluster analysis, and regression analysis. The results show that patent strategy positively and significantly impacts patent management sophistication, and that the patent organization positively moderates this relationship.

**Keywords** – Patent management, Patent strategy, Patent Organization

**Paper type** – Academic Research Paper

## 1 Introduction

Firms increasingly realize that patents should not be considered an administrative and legal burden, but rather as (costly) assets that can bring economic and competitive advantage if properly managed (Ernst and Fischer, 2014). With this background, a stream of literature has developed around the concept of patent management that, according to Agostini et al. (2019), Moehrle et al. (2017) and others, is a macro-process consisting of several processes supported by the characteristics of the patent organization (e.g. Granstrand, 2000) and strategy (e.g. Somaya, 2012). More recently, there has been a further development of the literature on the patent management process, which has adopted a broad perspective and presented frameworks meant to organize the different patent management activities. In particular, authors (e.g. Agostini et al., 2019; Moehrle et al., 2017) have converged towards the view of patent management as composed of core processes (i.e. patent generation, portfolio management, intelligence, exploitation and enforcement) and supporting dimensions (strategy and organization for patenting), which has contributed to shed more light on the conceptualization of patent management. However, to the best of our knowledge, no previous study has looked into the interrelationship among these processes and dimensions with an overarching perspective, instead of on specific matters (e.g. Holgersson et al., 2018; Teece, 2018). This issue is particularly relevant, because poor patent management processes/activities, rather than the size of patent portfolio, seem to reduce the value derived from patents (Somaya, 2012). In this situation, patent strategy, which “reflects a coordinated effort for developing, managing and using patents to accomplish company's goals” (Gilardoni, 2007, p. 1), sets the conditions for core processes to work well. Furthermore, the objectives of patent management should be coherent with the organizational choices, as recently outlined by Gassmann et al. (2021) who sustain that “successful patent management in a company is rooted choosing the right organizational form” because “the best strategy is good-for-nothing if it is not consistently implemented. This requires suitable structures and processes within the company.”

As patent strategy now is a much more complex matter, with lots of different interdependent activities, we hypothesize that a well-functioning internal patent organization is critical for the patent strategy to be translated into successful patent-related activities.

Based on these premises, the purpose of this article is twofold: the former, more explorative, is to verify the existence of different profiles of firms based on the level of sophistication of their PM core processes; the latter, more structured, is to test the impact of the interplay between PM supporting dimensions, namely patent strategy and organization for patenting, on the level of sophistication of PM core processes.

The remainder of the article is structured as follows: firstly, we set the theoretical background leading to our hypotheses; secondly, we explain the methodology; thirdly, we present the results of the empirical analyses; and fourth, we discuss results in light of extant literature before deriving the theoretical and practical implications.

## **2 Theoretical background and hypotheses**

### ***2.1 The patent management process***

Our starting point is a view of patent management as a complex process going beyond the binary decision of whether to apply for a specific patent or not. The complexity relates to several dimensions, among which a few refer to the multitude of use cases and motives for patenting (Holgersson, 2013; Somaya, 2012), as enforcing the rights against potential infringers is the formal and legal use of patents, but also signalling and licensing (Chirico et al., 2020; De Rassenfosse et al., 2016) and improving freedom to operate (Holgersson & Wallin, 2017). Moreover, patent management includes the analysis of and interaction with multiple external actors, and their supply and/or demand of patents; for example, patent data can provide valuable insights in the R&D directions of others (Ernst, 2003). Furthermore, patent management must continuously reconsider the patent portfolio (Bader et al., 2012).

These are some important dimensions that patent management must embrace. Previous research has already identified a number of core processes covering these dimensions (Agostini et al., 2019; Moehrle et al., 2017; Somaya, 2012). For example, Somaya (2012) identified the generation, licensing, and enforcement of patent rights. This conceptualization of the core processes of patent management was later expanded by Agostini et al. (2019) to include patent generation, freedom to operate, patent portfolio management, patent exploitation and enforcement, and patent intelligence. In this paper, we build upon Agostini et al.'s

review of patent management measures along the lines of these core processes, which will be further developed in the methods chapter.

We expect to find variation across firms in terms of how sophisticated their patent management processes are, and expect that more sophisticated firms typically are more advanced across all core processes of patent management. Thus we formulate the following first hypothesis:

*H1: Firms can be clustered based on their level of sophistication of the PM processes.*

## **2.2 The patent management process**

Our main interest is to investigate the impact of patent strategy and patent organization on patent management processes. In other words, do patent strategy and organization matter for the sophistication of patent management?

Research on intellectual property (IP) management increasingly argues for a strategic perspective of IP and patents (Reitzig, 2007; Somaya, 2012; Teece, 2018). Both research and practice of patenting have raised concerns about the overly operational, rather than strategic, focus of patenting, where a budget is provided to a patent unit, and patenting decisions follow in line with the budget—too often disconnected from the business model and corporate strategy of the firm. While this message, arguing for a more strategic perspective, resonates well with us, there is still a gap in the literature in terms of showing that a patent strategy actually matters for the patent management process.

Nevertheless, much previous research in the more general strategy domain tells us that strategy helps us to choose a specific path, and align decisions accordingly (Rumelt, 2012). This may be especially important for patenting, since patenting decisions are long-lasting and therefore need to be aligned with each other and with the long-term direction of the firm (Wustmans et al., 2019). Following this argument, we formulate the following hypothesis:

*H2: Patent strategy has a positive impact on the level of sophistication of PM processes.*

Not only strategy matters, however, but also organization and the culture of the organization. A famous saying attributed to Peter Drucker is that “culture eats strategy for breakfast”. The meaning of this message is not that strategy is of no importance. On the contrary, strategy is important, but without the right culture of the organization—a culture that represents the strategy—the strategy will

never be successfully implemented in decisions throughout the organization (Deshpandé and Farley, 2004). Thus, the organization and its culture often moderates the impact from strategy on a firm's processes and performance (e.g. Nandakumar et al., 2010). Consequently, we formulate the following final hypothesis for how patent organization impacts patent management processes:

*H3: Organization for patenting positively moderates the relationship between patent strategy and the level of sophistication of PM processes.*

### **3 Methodology**

#### **3.1 Sample**

Considered the research aim, we adopted a purposive sampling technique to identify potential respondents to our survey. We targeted 927 professionals (e.g. patent managers, intellectual property managers, patent engineers, patent analysts) who hold a formal role within the patent management area in companies in Central European countries (i.e. Germany, Austria, Switzerland, Belgium, Hungary, and Poland). The questionnaire, sent via SurveyMonkey, included an explanation of the research purpose, the items measuring activities and organizational aspects operationalised as detailed in the subsequent paragraph.

In the end, we collected 103 completed questionnaires, which corresponds to a response rate of 11.1%. Of these firms, 82 provided their details (it was optional), which allowed us to retrieve information of their patent portfolio, which is useful for our analysis.

#### **3.2 Measures**

To operationalise our variables, we relied on measurement scales for PM processes and supporting dimensions developed by Agostini et al. (2019) who identify five PM processes: Patent generation (GEN) includes activities mean to find out what has already been patented, i.e. state of the art analysis (G\_SOA) and to decide the jurisdictions the firm wants its patent protection, i.e. patent geographical scope (G\_GEO); Freedom to operate (FTO) refers to the understanding of whether the characteristics of the object of the patent could infringe valid intellectual property rights of others, i.e. freedom to operate (F\_FTO)

and the ability to take actions to hinder other firms from holding patents in the field of interest, i.e. securing freedom to operate (F\_SEC); Patent portfolio management (PORTF\_MNG) refers to the activities related to routinely reviewing the firm's patent portfolio to discover whether its patents are still providing value to the firm (P\_REN); Patent exploitation and enforcement (EXPL\_ENF) encompasses activities related to whether and how the firm can exploiting its patents outside its boundaries to reap monetary or non-monetary benefits, as searching for other firms potentially interested in using patented technologies, i.e. proactive licensing (E\_LIC), voluntarily disclosing information on technologies and patents to make third parties get to know the firm, i.e. signalling effect (E\_SIGN), and searching for other firms' infringements and enforce the patents when needed (i.e. enforcement (E\_ENF); Patent intelligence (INTELL) comprises the activities to the firm's competitive and technological landscape using information about third parties' patents, as monitoring existing or emerging patents regularly, i.e. patent watch (I\_WTC), and analysing third party patents, i.e. patent landscape (I\_LSD).

To operationalise organization and strategy, we also referred to the measures developed and tested by Agostini et al. (2019). Organization for patenting (ORG) refers to the organizational arrangements related to the management of patents and includes activities as the provision of incentives for employees active in patent activity, i.e. patent rewarding (O\_REW), the existence and activity of a patent committee with responsibilities over patenting activities, i.e. patent committee (O\_COM), the level of commitment and involvement of top managers in patent-related issues, i.e. top management involvement (O\_TOP), the presence of a spread culture about patents, i.e. patent culture (O\_CUL). Patent strategy (STRAT) reflects the ability to see patenting as a strategic source of value and competitive advantage and, thus, align it with the overall business strategy.

All variables are measured on a 5-point Likert scale; Table 1 shows the details of the measurement items of all variables.

In the t-test and regression analysis, we used also the firm patent portfolio size (N\_PAT) that we retrieved in the patent platform Derwent Innovation.

### **3.3 Statistical procedure**

We relied on a confirmatory factor analysis (CFA), to check validity and reliability of our measures, a cluster analysis, complemented by a t-test, to

identify clusters of firms with a different level of sophistication of PM processes, and a regression analysis to assess the relationship between organization and strategy and the level of sophistication of PM processes.

For the CFA, we conducted a principal component analysis with promax using the software SPSS. All items were significantly related to their underlying constructs, providing support for convergent validity, and most factor loadings greater than 0.7 (see Table 1). We further assessed discriminant validity by examining Cronbach's  $\alpha$ , which showed alphas definitely higher than the threshold of 0.60 (Nunnally, 1978).

For the cluster analysis, we used SPSS applying a K-means method. Based on the research purpose, PM processes were the clustering variables. After the identification of clusters, we carried out a t-test with the software Stata to check if those clusters of firms showed significant difference in terms of organization for patenting, patent strategy and patent portfolio size.

To support these results still further, we performed a regression analysis to test the impact of the interplay of patent strategy and organization for patenting on the level of sophistication of PM processes. Here, the constructs related to activities were aggregated into the macro-variables associated to PM processes and supporting dimensions by calculating the mean value, following previous studies (e.g. Furlan and Vinelli, 2018).

To test the moderation, we carried out a two-group analysis based on the level of organization for patenting. We included in the "High/Low ORG" group firms with levels of organization for patenting higher/lower than the mean of the sample respectively. Afterwards, we carried out a Chow test (Chow, 1960) to assess the statistical difference between the regression coefficients associated to the independent variable, i.e. strategy for patenting.

Table 1: Results of the confirmatory factor analysis

	Construct	Id	Items	Factor loading	Cronbach's alpha
GENERATION	State-of-the-art analysis	While carrying out an R&D/innovation project in our company, we (1=strongly disagree; 5=strongly agree):			0.694
		G_SOA_1	Identify and store all information that might be relevant to a patent's claims of novelty/patentability	0.651	
		G_SOA_2	Gain insights into what has been patented in a certain technological	0.877	

FREEDOM TO OPERATE			field				
		G_SOA_3	Use public and private databases to check relevant existing patents/prior art in the technological field	0.824			
	Geographical scope	While carrying out an R&D/innovation project in our company, we (1=strongly disagree; 5=strongly agree):				0.813	
		G_GEO_1	Examine carefully in which countries we want to file each patent	0.855			
		G_GEO_2	Carefully analyze the specific rules/procedures/fees of each jurisdiction	0.757			
		G_GEO_3	Consider current and future market needs in different countries	0.826			
		G_GEO_4	Follow specific criteria (e.g. location of manufacturing facilities, target market, core countries, cost of filing/renewal, activities of competitors) to select in which countries to file patents	0.750			
		Freedom to operate analysis	While carrying out an R&D/innovation project in our company, we (1=strongly disagree; 5=strongly agree):				0.845
			F_FTO_1	Analyse the most critical in force patents (all independent claim) with technical staff for the most critical cases	0.836		
			F_FTO_2	Check the probability of litigation	0.841		
			F_FTO_3	Use databases to check the evolution of a other firms' pending patents	0.880		
			F_FTO_4	Formulate a formal opinion on the freedom to operate of the freezed concept	0.743		
		Securing freedom to operate	Please, indicate your level of agreement (1=strongly disagree; 5=strongly agree) with the following sentences regarding managers in your company in the last years:				0.733
			F_SEC_1	File patent application to defensively prevent other firms' grant of exclusive rights over markets and technologies	0.804		
			F_SEC_2	Use offensive patenting to exclude competitors from using a technology	0.856		
			F_SEC_3	Consider developing a thicket of patents surrounding the single invention	0.728		
M	Patent renewal	Please rate your level of agreement or disagreement with these statements regarding patent renewal in your company:					

EXPLOITATION AND ENFORCEMENT		P_REN_1	We follow specific criteria (e.g. location of manufacturing facilities, target market, core countries, cost of filing/renewal, activities of competitors) to select in which countries maintaining patents	0.748	0.814	
		P_REN_2	We regularly check whether expected future benefits of a patent exceed the cost of renewal in a particular country before renewing it	0.749		
		P_REN_4	We regularly review patent portfolio to consider which patents to maintain	0.810		
		P_REN_5	We consider the technological impact of patents when making patent renewal decisions	0.774		
		P_REN_6	We regularly assess how to use patents in our portfolio (e.g. to support an existing technology, to prevent a competitor to use that technology, to sell the patents)	0.726		
		Signalling effect	Please, rate your level of agreement or disagreement with the following statements regarding patent exploitation in your company:			
	E_SIG_1		We use patents to attract debt capital, such as bank loans	0.875	0.812	
	E_SIG_2		We use patents to attract equity capital, such as venture capital	0.870		
	E_SIG_3		We use patents to set better conditions in merger and acquisition operations	0.823		
		Enforcement	Please, rate your level of agreement or disagreement with the following statements regarding enforcement in your company:			
	E_ENF_1		We regularly look for infringers	0.747	0.638	
	E_ENF_2		We focus our monitoring on patents with broad claims	0.779		
	E_ENF_3		We pursue patent enforcement in case of infringement	0.734		
		Proactive licensing	Please rate your level of agreement or disagreement with these statements regarding patent portfolio in your company:			
	E_LIC_1		We check potential for out-licensing into other markets or technology areas	0.864	0.941	
	E_LIC_2		We check potential for out-licensing within our own markets or technology areas (short-term ROI)	0.828		

INTELLIGENCE		E_LIC_3	We assess the patents that are suitable to be externally out-licensed	0.861		
		E_LIC_4	We put a lot of commitment in licensing out	0.792		
		E_LIC_5	We give a high-priority to non-core patents during out-licensing decisions	0.662		
		E_LIC_6	We actively search overseas alliances for out-licensing	0.909		
		E_LIC_7	We search similar technologies (e.g. through the analysis of citations) to find firms potentially interested in licensing our technologies	0.911		
		E_LIC_8	We actively search other industries for out-licensing	0.881		
		Patent watching	Please rate your level of agreement or disagreement with these statements regarding patent monitoring in your company:			
			I_WTC_1	We regularly monitor granted patents and/or newly issued patents as well as possibly pending patent applications	0.852	0.857
			I_WTC_2	We regularly build a picture of external patent activity around a particular technology	0.877	
			I_WTC_3	We regularly build a picture of external patent activity around a particular competitor	0.912	
		Patent landscape depth	Please, indicate your level of agreement (1=strongly disagree; 5=strongly agree) with the following sentences regarding information sharing along the supply chain in the last years:			
			I_LSD_1	We use multiple indicators (e.g. citations, number of inventions, geographical scope) to analyze patent data	0.810	0.863
			I_LSD_2	We compute/calculate indicators with the aim of analyzing patent data along different dimensions (e.g. temporal, technical, geographical)	0.836	
			I_LSD_3	We create patent maps that allow complex patent information to be understood easily	0.869	
	I_LSD_4	We create patent networks that visualize complex technological relationships	0.851			
5	Patent	Please rate your level of agreement or disagreement with these statements				

ORGANIZATION FOR PATENTING	strategy and alignment	regarding the patent strategy in your company:			
		S_STRAT_1	We have a clear plan for patenting	0.852	0.867
		S_STRAT_2	We see patenting as a corporate strategic decision	0.877	
		S_STRAT_3	We build our patent portfolio based on how patents can help our company to gain and sustain competitive advantage	0.912	
		S_STRAT_4	Our company looks at the corporate vision and objectives to determine what the company wants to accomplish with patent management	0.810	
		S_STRAT_5	Our company decides how to organize patent management based on the overall strategy of the firm	0.836	
		S_STRAT_6	Looking at the actual and expected future position of the firm, our company sets the activities, decisions and outcomes of patent strategy	0.851	
	Patent culture	O_CUL_1	Patenting is a common concern for all employees	0.675	0.890
		O_CUL_2	We emphasize education and training for managers, engineers, and researchers to improve their knowledge and skills in patent management	0.876	
		O_CUL_3	We foster behavioral attitudes and norms regarding patenting	0.872	
		O_CUL_4	We make efforts to spread the patent culture at all levels	0.836	
		O_CUL_5	Patenting is embedded in our company's day-to-day operations and procedures	0.742	
	Patent committee	O_COM_1	Technology staff submits invention disclosures to the patent committee for evaluation	0.853	0.715
		O_COM_2	The committee encourages the staff to submit disclosure forms	0.880	
		O_COM_3	The committee meets regularly	0.628	
	Patent rewarding	O_REW_1	We have incentives (monetary or nonmonetary) for idea generation	0.813	0.760
		O_REW_2	We have incentives (monetary or nonmonetary) for employees notifying patentable discoveries	0.797	

		O_REW_3	We have incentives (monetary or nonmonetary) for employees who file a patent application	0.746	
		O_REW_4	We have incentives (monetary or nonmonetary) for employees who obtain a granted patent	0.812	
	Top management involvement	O_TOP_1	Top management is actively involved in patent strategy definition	0.812	0.736
		O_TOP_2	We develop a common language to share issues regarding patent management with top management	0.693	
		O_TOP_3	Top management is regularly informed on ongoing activities related to patenting	0.819	

## 4 Results

### 4.1 Results of the cluster and t-test analysis

The cluster analysis distinguishes two clusters of firms with different levels of sophistication of PM processes: Cluster 1, including 19 firms, has a lower level of sophistication of PM processes (the “low” cluster) with respect to Cluster 2, counting 59 firms (the “high” cluster).

As Table 2 exhibits, the only two activities that seem not to be significantly different between the two clusters are signalling effect and proactive licensing. Actually, these two activities register lower values with respect to the others and these lower values are similar in the two clusters. Overall, activities directed towards third parties, which go beyond the monitoring of third parties patent activities, seem to be less implemented.

Table 2: Clustering variables – Descriptives and ANOVA

Variable	Mean	Cluster 1 ( <i>Low</i> )		Cluster 2 ( <i>High</i> )		ANOVA
		Mean	Std deviation	Mean	Std deviation	
G_SOA	4.19	3.68	0.684	4.36	0.464	***
G_GEO	3.98	3.49	0.856	4.18	0.545	***
F_FTO	3.73	2.75	0.920	4.10	0.531	***
F_SEC	3.82	3.10	0.916	4.07	0.547	***
P_REN	3.96	3.32	0.761	4.19	0.415	***
E_SIG	2.61	2.54	0.982	2.64	0.951	n.s.

E_ENF	3.39	2.79	0.432	3.59	0.537	***
E_LIC	2.57	2.44	1.163	2.62	0.894	n.s.
I_LSD	2.96	2.04	0.689	3.27	0.768	***
I_WTC	3.70	2.58	0.837	4.09	0.661	***

Note: \*\*\* means that the test is significant at  $p < 1\%$  level; n.s. = not significant.

The t-test reveals that the “high” cluster registers also significantly higher levels of patent strategy and organization for patenting than the “low” cluster, as Table 3 exhibits.

Table 3: Patent strategy and organization for patenting – Descriptives and t-test

Variable	Mean	Cluster 1 (Low)		Cluster 2 (High)		T-test
		Mean	Std. dev.	Mean	Std. dev.	
STRAT	3.83	3.31	0.684	4.01	0.536	***
O_REW	3.22	3.07	0.959	3.88	0.892	**
O_COM	3.73	2.81	1.451	3.33	1.374	**
O_TOP	3.56	3.55	0.713	3.81	0.666	**
O_CUL	3.31	3.07	0.791	3.73	0.757	***

Note: \*\*\* means that the test is significant at  $p < 1\%$  level; \*\* significant at  $p < 5\%$  level.

#### 4.2 Results of the regression analysis

While the evidence already speaks in favor of H2 and H3, we employed regression analyses to formally test H2 and H3. As Table 4 exhibits, we included in Model 1 only patent strategy, in Model 2 only organization for patenting and in Model 3 both supporting dimensions as independent variables, beyond patent portfolio size as the control variable. Model 1 is able to explain a higher percentage of the response variable variation than Model 2; moreover, when adding both patent strategy and organization for patenting as independent variables, patent strategy remains highly significant, whereas organization for patenting does not; this holds true independently of the PM process used as a dependent variable. All these evidences support that patent strategy is the strongest predictor.

If we look at Model 4 and Model 5 in Table 4, we can notice that the magnitude of regression coefficient and the associated level of significance in the “High ORG” group are higher than in the “Low ORG” group. This evidence remains stable for all PM processes used as dependent variables, a part from the patent generation process that is significant at 1% level in both groups, which means independently of the level of sophistication of the activities in the

organization for patenting dimension. The Chow test, differently from all of the other PM processes, is not significant for the patent generation process.

## 5 Discussion and conclusions

Results of this study show that two different profiles of firms exist based on the level of sophistication of their PM core processes, that patent strategy positively and significantly impacts patent management sophistication, and that the patent organization positively moderates this relationship. In other words, a patent strategy, supported by a well-developed patent organization and culture, will positively influence the processes of managing a firm's patent portfolio.

This is, to our knowledge, the first time quantitative empirical evidence is provided that supports the notion that it is important to take a strategic perspective of patent management. Considering how widespread this message has been in both research and practice during recent years (Holgersson et al., 2018; Reitzig, 2007; Teece, 2018), our results might not be surprising. But they are nevertheless important. There is now evidence that patent strategy—including the alignment with firm strategy—positively impacts patent management processes.

Maybe more interestingly, our results highlight the moderating—rather than direct—impact of patent organization on patent management processes. Thus, the patent organization and its culture is what translates the patent strategy into successful patent management processes. The organization plays an important role, but only when there is a strategic direction to act upon. This goes in line with previous research on the interaction between strategy, organization, and performance more generally (e.g. Nandakumar et al., 2010), but our results are to our knowledge the first to show this type of interaction in the area of patent management.

Our study is not without limitations, and these limitations also motivate additional research in this area. First, we have not been able to test the direction

of causality by means of the dataset used in this paper. While we have good reasons to hypothesize that the direction goes from patent strategy to patent management processes, there could be mechanisms by which sophisticated management processes, supported by organization, result in strategy. Future quantitative and qualitative studies may explore this question further.

Second, with our dataset we are not able to investigate how strategy's and organization's impact the sophistication of patent management processes have long-term positive impact on the general firm performance. This relates to an ongoing larger discussion about the long-term effects and value of patents (e.g. Gambardella et al., 2017).

Third, our empirical data covered a number of European countries. While patenting becomes increasingly internationalized and converged in terms of various national and technological preferences (e.g., Granstrand and Holgersson, 2014), there are still national differences. These difference include to what extent patenting is seen as strategic, with quality focus, and operational, with quantity focus (Ibid.; Hu et al., 2017). Hence, it is possible that our results would differ in countries where the IP system and IP competence are still emerging. Consequently, follow-up studies with a different geographical focus would be valuable.

### **Abstract**

Responsible Research and Innovation (RRI) aims to involve stakeholders and society actively in innovation processes, making them more responsible and collaboratively while tackling pressing societal challenges. Facing difficulties in translating this concept from theory into practice, co-creation has been identified as a potential approach to operationalize RRI involving organizations into concrete initiatives. As a non-linear process, it involves multiple stakeholders in an iterative, collaborative development procedure of products, services, policies, or systems intended to obtain a satisfying solution for all involved actors. This contribution investigates co-creation applied and assessed in a learning-by-doing process to explore the dynamics and results of knowledge exchange and capacity building. Knowledge is gained from the H2020 project SISCODE, which examines the operationalization of RRI through co-creation in concrete contexts with real-life experimentations. With the setup of an experiential learning process, ten pilot experimentations using co-creation to tackle various societal challenges across Europe were conducted.

To monitor and assess the direct results, mid-term outcomes, and the potential of long-term impact, an assessment framework was developed as part of the project. It consists of monitoring practices and tools that focus on collaborative data collection to foster self-reflection and track changes over time.

The dimensions investigated aimed at obtaining a perspective of capacities built and learning processes triggered as indirect results of the process to sustain co-creation and Responsible Innovation in the long term beyond the single initiative.

The capacities developed as a result range from soft skills (like empathy) to the capability of systemic thinking and the application of co-design tools. Activating a broader reflection,

it is finally discussed the roles of prototypes as boundary objects for learning processes, the need to create a safe and encouraging space as a learning environment and long-term strategies for in-depth change.

**Keywords** – Responsible Research and Innovation, co-creation, capacity building, organizational learning

**Paper type** – Academic Research Paper

## 1 Introduction

Responsible Research and Innovation (RRI) has emerged in recent years to involve society in innovation processes. The EU showed a clear interest towards more responsible innovation practices while pointing at the urgency to effectively involve citizens and stakeholders in the co-creation of solutions for pressing societal challenges. However, this translation from theory into practice to implement RRI and embed it into contextual practices, specifically into organizational practices, is a significant and well-known challenge.

Co-creation as a practice was pinpointed as a driver for empirical and experimental approaches stressing its practical orientation and its nonlinear process, leading to increased versatility in adapting to different and changing contexts (Payne et al., 2008).

Furthermore, a central focus of co-creation transforms the passive user's figure into an active agent in the development process. A noticeable trend within society shows how users are becoming co-creators of the products and services addressed to them (Sanders, 2005). As a result, their value is commonly decided and developed among service providers, stakeholders, and end-users (Saarijärvi, 2012).

These characteristics of co-creation make it a promising approach to the claim of RRI to change the way innovative initiatives evolve and which actors are engaged in their development (Bajmócy & Pataki, 2019).

The application of co-creation within the field of RRI aims to create co-produced solutions in collaboration with all involved actors to include a variety of perspectives from the very beginning of the development process and assess its impact from early stages. These processes and activities require adopting novel practices that often require an in-depth shift within organizations to effectively practice and embed co-creation (Hansen et al., 2020).

Specific novel capacities can be a trigger for organizational change and enhance the available capacity of an organization to innovate, leading to competitive advantages on the market (Nguyen and Huber, 2019). However, there is still a lack of documentation on how these capacities are built and embedded within an organization concretely.

## **2 Background**

### ***2.1 Responsible Research and Innovation and co-creation***

RRI as an approach to include society in innovation was introduced as a top-down concept even though it promotes a bottom-up approach (Zwart et al., 2014). However, the trend towards more responsible innovation practices points out the urgency to effectively involve citizens and stakeholders in the co-creation of products, services, and policies providing concrete directions for applying the principles of RRI. Many have been attempting to show the benefits and relevance derived from applying co-creation, aiming to open up the practice to broader audiences, making research and innovation more accessible, responsible, and inclusive. Nevertheless, mainly because of its nature perceived as abstract and research-oriented, and hence difficult to be operationalized, there are still limitations in its diffusion and uptake in actual settings (Von Schomberg, 2013). To embed the principle in real-life settings is fundamental to establish it as a common practice and promote approaches for its implementation, such as co-creation. The embedment ensures that RRI is not considered a temporary concept but fully adopted to innovate responsibly beyond the single initiative. Capacity building and learning processes have positively impacted an organizations' capability to innovate and perform successfully (Liao et al., 2008; Argote, 2012). Moreover, RRI has been directly connected to RRI by Egeland and colleagues (2019), describing the performance of Responsible Innovation as a learning process for the organization practicing it.

### ***2.2 Organizational capacity building***

The integration of co-creation as an approach towards more Responsible Innovation additionally implies introducing new practices and ways of working in relation to co-creation within organizations. Studies on organizational learning

and capacity building within organizations have significantly increased in the last decades providing various definitions of the terms and different approaches to the topic (Schulz, 2002; Kaplan, 2010) and pointing out the complexity and extensiveness of the processes (Cornforth & Mordaunt, 2011).

Some specificities and concepts of capacity building investigated are detailed in the following that functioned as a base for the study presented here.

The advantages of building capacities through learning-by-doing processes within organizations were pointed out by various scholars (Brix, 2019; Mullen et al., 2015) that often did not only include the organization itself but its environment, actors, and stakeholders, enhancing learning through interaction (Engstrom & Kakela, 2019).

Linden and colleagues (2019) argue that effective and long-term learning processes within organizations do not take place in a closed environment but require the involvement of other actors and stakeholders to connect strategic and operational aspects. Furthermore, processes of organizational learning can increase the overall innovation capacity of an organization even leading to advantages on the open market in comparison to competitors (Argote, 2013; Liao et al., 2008).

In line with the principles of RRI and co-creation, working across boundaries and disciplines has proven to encourage innovation and change. On the other hand, it also leads to frequent difficulties due to the mismatch between the desire to innovate and how it relates to the knowledge of the stakeholders engaged in the process, which can be varied and often domain-specific. A challenge that can act both as a source and barrier to innovation (Brown and Duguid 2001).

### ***2.3 Co-creation in RRI as a versatile approach for organizational capacity building***

In co-creation ecosystems, this variety of perspectives comes with a multiplicity of expertise and knowledge able to sustain and encourage innovation. From a managing knowledge standpoint, a relationship among actors that goes beyond sharing domain-specific knowledge and reaches out to be able to assess their mutual knowledge (Cramton 2001) supports innovation by setting the conditions for better grasping challenges and possibilities, sharing meanings and knowledge transfer, even across domains (Carlile 2004).

Co-creation has particular attributes and aspects like collaboration, discussion, and communication that make it a promising approach that may trigger organizational capacity building.

Constant **communication and exchange** are a core aspect of co-creation and fostering activities with these features among the members can support uptake and learning. In this regard, Morland and colleagues (2019) have pointed out the importance of communication, discussion, and shared sensemaking within multi-cycles of learning for long-term learning within organizations.

Closely related to sharing and communication, the **collaborative** features enhancing this communication are another aspect worth mentioning.

It regards not only activities within the single organization but the cooperation of various actors in ecosystems and environments that proved to improve uptake through direct experiences and interaction with the surrounding context (Argote, 2012).

Furthermore, the **practice-based** and hands-on mentality of co-creation provides **tangible examples** and inherits the potential of learning-by-doing. Concrete initiatives and prototypes can work as **boundary objects** (Star & Griesemer 1989) able to favor exchange and understanding, as well as overcoming the stickiness due to knowledge situated or siloed in specific domains (Tyre & von Hippel, 1997; von Hippel, 1994). Rhinow and colleagues (2012) discuss the impact of prototypes at both the level of the design teams involved in developing the solutions and then the broader level of organization, potentially impacting its flows and structures.

## ***2.4 Monitoring and assessing impact and capacity building***

One of the main challenges in investigating co-creation and capacity building, not only within an RRI context, is the difficulty to monitor and assess outputs, outcomes, and impacts (Saarjärvi et al., 2013; Hailey et al., 2005).

Hailey and colleagues (2005) defined capacity building as an intangible, highly complex, and variable process developing over longer periods that make its monitoring and assessment difficult and labor-intensive. The issues for the assessment of RRI are similar dealing with its intangibility and not measurable key dimensions that require its operationalization before it can be measured (Van de Poel, 2020, p. 348).

On the other hand, assessment is crucial to prove and communicate impact and to learn from conducted experimentations extracting best practices and drivers of both capacity building and RRI to prove impact, improve performances, and foster future initiatives (Peter et al., 2018; Hailey et al., 2005; Van de Poel, 2020).

The fact that assessment is often perceived as a valuing and imposed activity with few involvement of the experimentations themselves. This negative perception and the need to make assessment more inclusive led to the emergence of self-assessment actively involving actors in evaluation activities. These dynamics were observed both in studies on capacity building and RRI (Hailey et al., 2005; Ravn et al., 2019).

Another relevant topic is the data gathered through such evaluation practices. Dealing with often relatively small-scale experiments and applying assessment not only as a purely evaluating but at the same time self-reflective activity, data gathered is often purely qualitative and needs to be carefully elaborated to ensure its accuracy and substance (Van de Poel, 2020; Carmines & Zeller, 1979) resulting in a non-straightforward and often iterative and collaborative process of assessment that needs to be individually adapted.

### **3 Capacity building in RRI contexts through co-creation**

#### **3.1 The SISCODE project**

SISCODE (Society in Innovation and Science through CO-DEsign - [siscodeproject.eu](http://siscodeproject.eu)) was a three-year project under the Horizon2020 program and ran from 2018 to 2021.

It involved 17 partners from academia and research institutes, networks of co-creation laboratories, and their members from various sectors.

It investigated the application of co-creation, its methodologies, and tools to operationalize RRI and build innovation capacities.

The researchers conducted extensive desk research and field research to analyze the current landscape of co-creation and Responsible Innovation (RI) and explore existing cases. Furthermore, ten real-life experimentations were carried out within SISCODE to investigate the dynamics and effects of co-creation applied following the same framework in different contexts across Europe.

A focus was set on the broader transformations in terms of novel practices, capacities, and capabilities developed in the organization and the surrounding ecosystem due to the application of co-creation and the interaction between citizens, stakeholders, and policymakers.

### ***3.2 Co-creation to build novel capacities in an RRI context***

For 21 months, ten co-creation labs across Europe identified locally relevant societal challenges. The labs carrying out the experimentation are part of three European networks: The FabLab network, the European Network of Living Labs (ENoLL), and the European Network of Science Centers and Museums (ECSITE). All networks functioned as project partners as well and provided direct support and networking opportunities.

The labs tackled the chosen local challenges by co-creating specific solutions involving actors and stakeholders in a previously defined co-creation journey consisting of four phases (Fig 01). It derives from the experiential learning cycle defined by Kolb, combining it with the phases of the Design Thinking process (Kolb, 1984; Parnes 1967).

This pre-defined process serves as a framework complemented by a set of tools and constant support from the partners of the project and exchange- and peer-to-peer learning sessions among the labs. The framework functioned as a general guide to give continuity to the various and fundamentally different experimentations providing the possibility to assess and evaluate them to some extent.

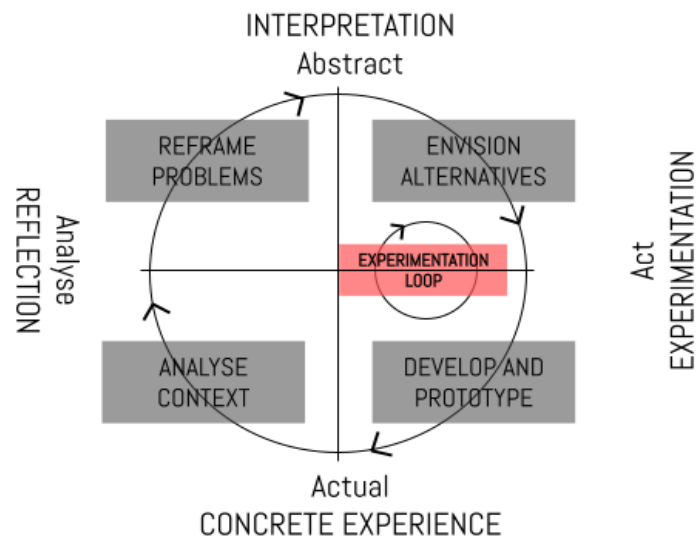

Fig 01 - SISCODE's learning framework

### 3.3 Methodology

The set-up and development of an assessment framework aimed at monitoring and assessing the results of the single pilots and encouraging reflection on the conducted experimentation on a broader level. It was designed to monitor and assess mainly the direct and indirect effects of the pilot experimentation and anticipate potential long-term impact reaching beyond the duration of the project and, therefore, the monitoring period itself.

The framework investigated three different levels and typologies of results (Fig 02):

- **Outputs**  
Direct results in terms of prototypes in the shape of products or services.
- **Outcomes**  
The changes triggered by the applied methodology in a learning-by-doing process and the prototype itself considering the longer-term and indirect outcomes as the uptake of new knowledge and learning processes triggered.
- **Impact**  
Impact refers to long-term changes like a shift in organizational culture or processes of decision making.

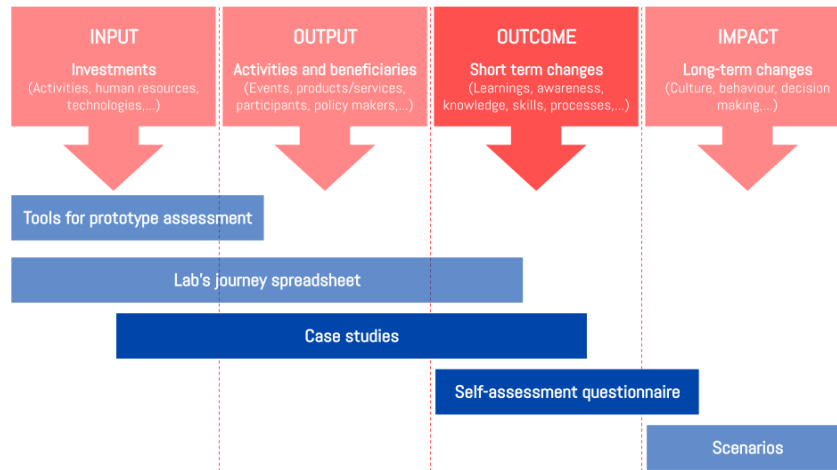

Fig 02 - Rationale of the SISCODE assessment framework

A set of tools specifically developed for the project investigated the different dimensions:

- **A monitoring spreadsheet** collecting quantitative data and documenting all the single activities conducted as well as the stakeholders and citizens involved.
- **A self-assessment questionnaire** submitted three times throughout the experimentation to identify and track changes related to organizational practices and routines.
- **Case studies** created by the labs document the investigation of each pilot in detail. The case studies documented the entire were written following the conclusion of the experimentation and also included a reflection on a broader impact of the project on the organization.
- **Video scenarios** produced by each of the labs to both provide a synthesis of the developed prototype and a future outlook, taking possibilities for scaling or replication into account.

The focus of this contribution lies mainly on the results of the self-assessment questionnaire and the analysis of the pilots as case studies shaping the mid-term outcomes in terms of triggered learning processes, knowledge uptake, and organizational change in terms of novel capacities and practices.

The data collected through the various tools during the experimentation provided holistic knowledge of the overall process, as well as of the manifold interdependencies across the different dimensions and factors analyzed relying

on a qualitative approach. Notes and insights were extracted from the data gathered, which were clustered and interconnected to identify recurring themes and patterns (Fig 03).

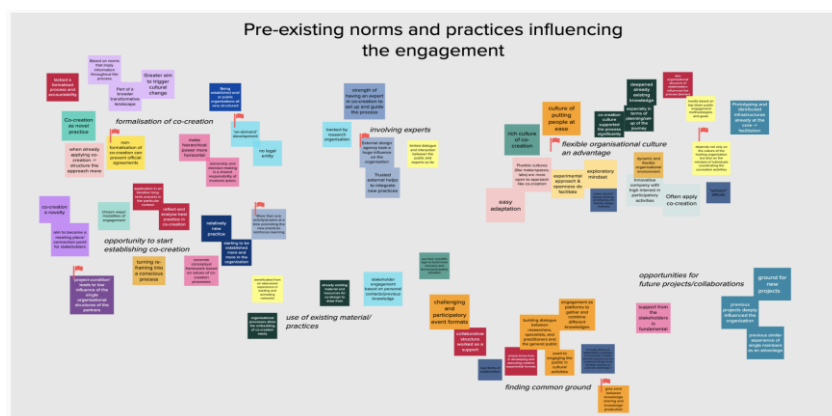

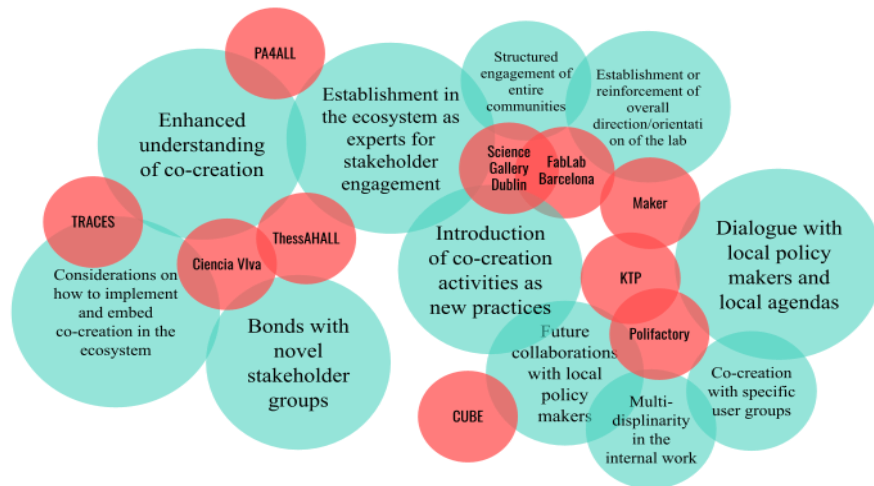

Fig 03 - Clusterization and elaboration of insights

The practices described and the examples derived from the experimentation show specific and context-related dynamics and specific features, also outlining typical traces and underlying concepts interconnecting the diverse cases. The descriptions of concrete examples connect to organizational practices to trace back to evidence and dynamics of capacity building and transformations. Especially the multiple conductions of the self-assessment over a longer timespan allowed a reflection on the multi-level impacts and general considerations on the assessment framework and its potential for adaptation for other RRI initiatives.

### 3.4 Results and evidence of capacity building

Especially the self-assessment questionnaire triggered reflections of newly developed capacities, occurred knowledge exchange, and related ongoing transformations of the organization. SISCODE investigated these capacities and practices mainly in relation to co-creation and stakeholder engagement as the main topics of the project. The findings gathered are mainly associated with acknowledging that real change takes an amount of time beyond the time frame of a project. However, there is first evidence on the embedding of novel organizational capacities and resulting in ongoing transformations. The figure

below reports the ten labs and the associated concrete practices that were newly adopted or significantly improved throughout the project (Fig 03).

*Fig 03 - Novel practices adopted during SISCODE*

The practices and capacities developed can be directly related to the experimentation conducted within SISCODE and its core themes. In fact, most capacities built can be related directly to the topics of stakeholder engagement and the capability to plan and conduct co-creation activities.

However, communicating the project's main topics and describing these capacities also triggered a broader reflection on changes and transformations activated in the organizations beyond the single initiative. Further considerations regarded the long-term impact that the exposure to co-creation methods and tools may have.

As a result of the data evaluation, a series of specific capacities were identified that were built or significantly improved throughout the experimentation. The main capacities as direct outputs are described in the following grouped by clusters:

- **Soft skills for communication and mediation**

The involvement of multiple and various stakeholders and users and the collaborative development of solutions led to the building and improvement of soft skills like empathy, capacity for mediation and negotiation, and flexibility in a learning-by-doing process on the field. These capacities can be traced back to the interaction with varied groups with different backgrounds, interests, and

motivations, which worked together towards a common solution. It is worth to be mentioned that this aspect was pointed out particularly in experimentations dealing with vulnerable groups like children or users with health conditions.

- **Systemic and holistic thinking and planning**

Adopting a broader view and taking all different points of view and involved actors into consideration triggered the improved ability to manage complexity. It also nurtured capacities related to systemic thinking and holistic planning of processes and activities considering broader and long-term effects into consideration. This was often practiced by using specific tools from the design field like stakeholder maps, system maps, or customer journeys to visualize and collaboratively plan and reason on procedures and solutions.

- **Flexibility and adaptation to the context**

The non-linear and iterative structure of the co-creation process enhanced flexibility and capacity to adapt and react to the ongoing and often unexpected changes and development throughout the process. Openness, the consideration of alternative pathways, and the adaptation of activities and tools to the specific context were pointed out in relation to this group of capabilities.

### ***3.5 Findings and reflections***

One of the main results from the observation and assessment of the experimentation concerning novel capacities is the role of concrete initiatives and of the resulting **prototypes as boundary objects**. The latter demonstrated to trigger learning-by-doing processes and make practices of co-creation tangible, facilitating their adoption. The process of designing prototypes through a participatory approach can incentivize communications and exchanges within and through the organizations involved. In addition, the existence of a concrete object of discussion facilitated the comprehension and also the conception of the new methods. This triggered moments of sharing and discussion within the organization shedding light on conflicts with existing practices and creating a space for experimentation and facilitation of integration.

Another aspect concerning the building of novel capacities within a project framework is the **function of a terminable activity as a safe space** for the experimentation and subsequent adoption of novel practices – as a safer space than a direct implementation. The opportunity to apply a new and disruptive practice in a temporary context like a project withholds the possibility to end its

utilization together with the single initiative. The protected space that this condition creates appears to facilitate the introduction through a terminable space of experimentation that can be ended in case of failure without any further implications or drawbacks for the organization.

Another insight from the evaluation which particularly emerged from the self-reflection of the labs is the significant amount of **time required to achieve an in-depth change** within an organization. The importance of the aspect of time has pointed out especially the necessity to expose organizations and their members to co-design and its practices over a more extended amount of time, not only considering the single project as a self-contained and closed space for capacity building but as part of a broader, extensive learning process that necessarily goes beyond the single initiative to generate real impact.

The collaborative aspects of the experimentation did not only lead to the capacity to adopt other points of view and develop empathy but it also fostered familiarity with other fields and their expertise. Working in a multi-disciplinary environment with actors from varied background, first-hand knowledge from experts was shared and also transferred directly within the working group.

#### **4 Conclusions**

The experimentation conducted within SISCODE stressed the difficulty of assessing both RRI initiatives and the capacities built as a result.

One of the main findings of the research conducted is the need to develop a universal assessment framework for RRI initiatives to reduce the significant amount of time spent to develop and set up the evaluation activities in order to make them more sustainable. Such a framework would need to provide a set of indicators and tools to be adapted to the single initiative. A one-size-fits-all framework would be too reductive considering the high context-dependency and particularity of each experimentation, but a general framework with adaptable elements could be one approach towards common indicators and facilitation of evaluation. This could also withhold the potential to compare different initiatives at least to some extent.

Even though there is evidence of long-term changes and permanent embedment of new practices within the organization, future assessment, and research on how the capacities developed and spread across organizations over

time could be conducted, taking other initiatives in the field of RRI and co-creation into consideration.

One aspect to be taken into consideration is that the study experimented in FabLabs, Living Labs and Science Centers and Museums that by nature are innovation-friendly environments and future studies could extend this approach to less favorable organizations and settings exploring effects and results.

A limitation of the study so far is its recent conclusion not yet analyzing factual long-term changes beyond the conclusion of the project to investigate their spread in the organization tracing novel practices and capacities back to the experimentation and investigating influence and correlations with other, similar initiatives conducted in the organization.

### Abstract

The transfer of knowledge between universities and businesses has attracted the attention of many stakeholders. This process of knowledge transfer poses several challenges for universities such as the difficulties and barriers to the commercialization of patents. These assets need to be enhanced and communicated to third-parties to increase their impacts outside the university. In order to promote and increase the valorisation of university patents, in recent years new platforms have been activated, as well as the number of dedicated initiatives (e.g. the innovation fairs) has significantly increased. The technology transfer offices (TTOs) manage the patent portfolio of the universities and they face some challenges such as an effective transfer of knowledge to third parties, a proactive commercialization of university patents, and a promotion of these assets aimed at maximizing their impact. TTOs and inventors communicate patent information to third parties through short presentations/pitches and marketing sheets. The characteristics and attributes of patents can act as useful signals to reduce information asymmetries towards third parties. This qualitative research offers an analysis of the main characteristics and attributes of patents that influence investment or acquisition decisions by third parties. Interviews were carried out with several entrepreneurs and investors with specific experience in the field of university patents, and revealed key information on the main

characteristics and attributes of the patents that are of prime importance to them. These parameters could help TTOs, inventors and universities to implement their communication strategies and to improve their presentations/pitches or marketing sheets with the categories of characteristics/attributes that emerge from this research. This study could have interesting implications for some stakeholders such as universities, TTOs, inventors, innovation managers, platform managers, policy-makers, governments and public agencies.

**Paper type** – Academic Research Paper

## 1 Introduction

Over the years, the transfer of knowledge and innovation between universities and businesses has attracted the attention of many stakeholders (Kang, 2016), as well as it has become increasingly relevant for its significant contribution to global development (de Almeida et al., 2019; Ferreira et al., 2019; Hooi and Wang, 2020; Kaiser et al., 2009; Venkitachalam and Ambrosini, 2017). At the same time, knowledge transfer represents a crucial activity to foster the competitiveness of firms (Teixeira et al., 2019).

Daniel and Alves (2020, p. 278) underline that “Universities are regarding their third mission as an important challenge in the current era of knowledge-based economy” and they explore both the main challenges in University-Industry Technology Transfer process and the key drivers for the successful licensing of university inventions.

The technology transfer process poses some major challenges for universities, the main one being the commercialization of research results (Daniel and Alves, 2020). In particular, some studies have focused on patents and the related difficulties or barriers to their commercialization (Hermans and Castiaux, 2017; Valkokari et al., 2012).

Patents are strategic knowledge assets (Bontis, 2001; Marr et al., 2002) and they represent a key component of the intellectual capital’ structural dimension exploited by technological spin-offs to innovate their business models (Elia et al., 2017). In this vein, Elia et al. (2017) highlighted that these companies leveraged their patents to move towards a revenue model innovation.

Several scholars explored the value of patents (e.g. Grimaldi and Cricelli, 2020), being a significant element in influencing the performance of companies and their innovation results (Agostini et al., 2016; Zakery and Afrazeh, 2017), and their role in university–industry knowledge transfer (e.g. Crespi et al., 2010).

Patents can be considered as outputs of university technology transfer that need to be enhanced and communicated to third-parties to increase their impacts outside the university (Troise et al., 2019; Troise, 2020).

The management of patents (as well as other industrial proprieties) is one of the main activities of the technology transfer offices (TTOs hereafter) of universities (Netval, 2016, 2018). These offices increase the patenting activities of their universities and promote their links with industry (Cartaxo and Godinho, 2017; Coupé, 2003; Siegel et al., 2003; Thursby and Thursby, 2002).

In recent years, the total number of patents in the portfolio owned by Italian universities has been steadily growing. Based on the latest reports (see among other Netval report, 2018), which show the trend of patents for each year, about 4,000 patents are held in portfolios by Italian universities.

The TTOs manage the patent portfolio of the universities and they are continually called upon to face some challenges such as an effective transfer of knowledge to third parties, a proactive commercialization of university patents, and a promotion – as well as communication – of these assets aimed at maximizing their impact.

In order to promote and increase the valorisation of university patents, in recent years new platforms and tools have been activated, as well as the number of dedicated initiatives – such as innovation fairs – has significantly increased. An example of a new web platform is “Knowledge Share”, an online portal launched in 2019 by Netval, MiSE-UIBM and Polytechnic of Turin. Among the main innovation fairs, “Tech Share Day” and “Innovagorà” are two important examples.

The platforms act as intermediaries between the universities and the main stakeholders of the ecosystem, while the innovation fairs are useful opportunities for meeting and promotion activities. The purpose of participating in both platforms and fairs is to get in touch with third parties interested in investing or acquiring the outputs of technology transfer such as patents and academic spin-offs.

On these occasions, TTOs and inventors communicate patent information to third parties through short presentations/pitches and marketing sheets. The

characteristics and attributes of patents can act as useful signals to reduce information asymmetries towards third parties.

TTOs and inventors can increase third-party knowledge and interest in a given invention through specific presentations of patents characteristics in order to positively influence their subsequent acquisition and/or collaboration decisions.

Given the growing attention towards university patents in recent years, it is particularly interesting and useful to understand what are the factors that can lead to their success, that is, to attract the attention of third parties and induce them to invest financial resources.

This research offers an analysis of the main attributes and characteristics of patents that influence investment or acquisition decisions by third parties. The latter pay particular attention to certain parameters and use specific types of information to improve their knowledge of patents and their value.

Our main research question is: What types of patent characteristics and attributes influence third party investment or acquisition decisions and interests?

## **2 Background**

Patents are a typical signal used in the literature to represent the quality of the firm (Conti et al., 2013; Hottenrott et al., 2016; Mason and Stark, 2004) and useful for the latter to attract financing or obtain loans (Fischer and Ringler, 2014; Gredel et al., 2012). Among the main investment criteria of various types of investors, the ownership of patents is a recurrent parameter that influence their decision-making process. Patents are mainly used as signals in the investment decisions of two main types of investors analyzed in the literature, namely Venture Capitalists (VCs) (Baum and Silverman, 2004; Hsu and Ziedonis, 2013) and Business Angels (Bas) (Audretsch et al., 2012; Maxwell et al., 2011).

Despite many studies examined the signalling role played by patents for third parties, these types of studies focus on patents related to the companies that own the rights (i.e. whether or not the presence of patents can influence the decision-making process of third parties), while an aspect neglected in the current literature seems to be that relating to patents as elements not necessarily linked to a company. In fact, patents can be owned both by inventors who are not part of companies, and by universities that become owners following the transfer of the relative rights by the inventors (i.e. the ownership of these patents can be transferred by the inventors to the university). Currently, little is known about the

effects of the specific characteristics and attributes of patents on third parties such as investors and companies. The lack of knowledge of these effects is even more evident in the field of technology transfer and especially in that of patents owned by universities. These assets make up the patent portfolio of universities and are often not linked to a company.

The characteristics of patents could play a key role in influencing investment or acquisition decisions by third-parties. The information provided by TTOs and inventors may increase the latter's knowledge about the value of the patents and induce them to commit financial resources.

In the current scenario characterized by considerable efforts by universities and governments to promote innovations and patents born within universities, the understanding of what are the characteristics that can favour the sale of these assets and support their adequate valorisation assumes a great relevance.

Based on the above, this study aims to explore the characteristics of patents useful to act as quality signals to third parties.

### **3 Method**

In order to add new knowledge in this research field and identify which characteristics and attributes of patents serve as signals for third parties, interviews were carried out with some entrepreneurs and investors with specific experience in the field of innovation and intellectual property. In particular, the interviews were carried out with entrepreneurs and investors who already had experience with the specific type of patents of Italian universities (i.e. the group of experts interviewed is made up of individuals who have invested in this type of asset or have acquired patents from universities).

For this study, an inductive qualitative research design is used (Eisenhardt, 1989; Eisenhardt and Graebner, 2007) and the main source of information is represented by open and in-depth interviews with 22 experts.

The interviews focused on open questions related to what are the main characteristics and attributes that a patent must possess in order to be of interest to the interviewee, or to increase their knowledge and therefore useful both to limit information asymmetries and to positively influence their acquisition (licensing or purchase) or investment process.

## 4 Results and conclusions

Interviews with experts revealed key information on the main characteristics and attributes of the patents that are of prime importance to them. These parameters can be summarized as follows: applications; international extension; multi-sectoriality; exploitation; innovation development stage; inventor team; time to market; advantages; economic value.

These characteristics are relevant to third parties and can be considered useful signals for them. Therefore, TTOs and inventors should pay special attention to them as well as include these information in their patents' presentations.

Hopefully, this study will have interesting implications for universities, TTOs, inventors, innovation managers, platform managers, policy-makers, governments and public agencies, and other players of the entrepreneurial ecosystem.

It is critical today to know which patent characteristics drive third party investment/acquisition decisions. Knowing them will help inventors, TTOs and universities to implement their valorisation strategies and design the communication activities. In particular, in recent years, TTOs are increasingly involved in the promotion of patents held by universities and proactively participate in innovation fairs, in specific meetings with investors (e.g. "Borsa della Ricerca") and in implementing dedicated platforms with marketing sheets (e.g. Knowledge-Share). Based on the results of this study, universities and their TTOs can define and implement their communications strategies (Ferrara and Troise, 2018; Troise et al., 2019) as well as improve their presentations/pitches or marketing sheets with the categories of characteristics and attributes that emerge from this research.

The implementation of active policies for the enhancement of existing patent assets is a recurring problem within Universities (Cesaroni and Gambardella, 2001). The commercialisation of patents requires searching for investors and interested firms (Daniel and Alves, 2020). Hence, these patent characteristics can be a key factor in the successful transfer of the patent from universities to third parties. TTOs have different commercialisation strategies for their university outputs (Dias and Porto, 2018), therefore our research could be particularly important for universities in defining these strategies with the aim of increasing their valorisation and communication capacity.

This research could be particularly topical and interesting considering the entry of new actions into the ecosystem such as crowdfunding, and in particular equity

crowdfunding (Troise et al., 2020; Troise and Tani, 2021), which involve a crowd of investors who decide to finance certain initiatives and/or products based on some parameters that are relevant to them.

A possible promising future research in this field could be to investigate how the use of knowledge visualization (Troise, 2021) can increase the knowledge of third parties and influence their investment/acquisition decision making. The use of visualization tools could allow universities to increase their performance related to technology transfer activities, in particular those related to the transfer of patent knowledge from universities to external actors.

### **Abstract**

**Purpose** – The main contribution of this paper is the development of a methodology for conducting a systematic literature review implemented in a software named SMILE. The methodology and the SMILE tool are applied, as an example, to the field of human resource management in the context of Industry 4.0 or HR4.0.

**Methods** – After analysing characteristics of main approaches for systematic literature review (SLRs), we highlighted limitations of methods and tools currently used to support

researchers in SLRs and defined an original methodology for automating the SLR phases. The methodology, that can overcome limitations of other methods, has been implemented in a digital tool, SMILE. To validate the correctness of the methodology and test the robustness of SMILE, a SLR has been carried out to the case of HR4.0 and main results have been reported.

**Findings** – First, a methodology of automatic extraction of the most relevant contributions in the literature is presented. The methodology regards the implementation of Latent Dirichlet Allocation (LDA) as an unsupervised method of topic modelling that enables the identification of relevant topics from a collection of contributions selected from scientific literature. Second, SMILE, a digital tool for conducting systematic literature reviews, has been implemented in the form of a decision support system (DSS). SMILE supports the proposed methodology and is based on machine learning (ML) for natural language processing (NLP) and text analytics technique.

**Originality/value** – Compared to the previous review contributions, in this paper the authors propose an automatic methodology for the optimal choice of parameters used by Latent Dirichlet Allocation, such as the optimal number of topics calculated through iterative runs to perform best results in terms of words coherence in topics. SMILE reduces the effort of researchers by the implementation of an interactive procedure that allows the supervision of all the fundamental phases envisaged by the SLR.

## 1 Introduction

Literature reviews are an established research method able to advance knowledge in a scientific domain by organizing available knowledge. Several types of reviews exist, different from each other depending on the methodology required by the purpose of the review, for example using a typical purpose approach, research questions or basing the approach on examples of contribution (Snyder, 2019).

Due to the pace of scientific research in the organizational and managerial fields, the need to use a systemic approach to rationalize the growing body knowledge is increasingly pressing (Donthu et al., 2020). The high volume of scientific production, the emergence of interdisciplinary approaches and the high fragmentation of research contributions make systematic literature review an increasingly relevant research method (Snyder, 2019).

While a literature review qualitatively reports evidence on a specific topic using subjective methods to interpret studies, systematic literature reviews (SLRs) provide a broader overview of primary research on a specific question that identifies, selects, synthesizes and evaluates all the high-quality research evidence relevant to that question (Williams et al., 2020). Furthermore, traditional reviews do not follow rigid rules on the selection of contributions and consequently the choice of studies is very likely to be guided by the subjectivity of the author (Hodgkinson and Ford, 2014). Systematic methods offer the possibility to provide a clear picture of a knowledge domain and, because of the objective and repeatable method used, allows other scholars to confirm, challenge or expand the findings.

However systematic reviews can be burdensome. The number of articles to be analyzed can be of several hundred, to ensure high quality in the review process it is necessary to analyze all selected contributions which makes it difficult and time-consuming even for an experienced researcher (Carver et al., 2013).

Tools to facilitate the work of researchers have been developed, in particular, several automated methods have been implemented that can classify many documents in a given topic (Blei et al., 2003; Alghamdi and Alfalqi, 2013; Osborne et al., 2019).

There are currently complementary limitations when studying the state of the art of a specific topic: SLRs are very onerous in terms of the time required for domain experts to perform manual tasks; automated techniques hide some crucial phases from researchers, such as conceptual analysis in which human experience is fundamental.

This work aims to answer the following research questions:

*RQ1: Which phases characterize the process of SLRs according to a knowledge management perspective?*

*RQ2: What phases and how does the tool support the researcher in the execution of SLRs?*

With this aim, the paper presents a new tool (named SMILE) for conducting systematic reviews, which reduces the effort of researchers by the implementation of an interactive procedure that allows the supervision of all the fundamental phases envisaged by the SLR. SMILE can support also non-technical researchers in carrying out a systematic literature review thanks to the automatic selection of optimal parameters of the model such as number of topics (k) and showing in near real time the new results. Furthermore, the tool allows the choice of the

algorithm that best classifies the contributions and discovers research topics starting from the initial set of keywords.

In order to test the proposed tool a literature review on human resources management in the context of Industry 4.0 has been conducted.

## **2 Theoretical Background**

### ***2.1 Knowledge-based perspective in scientific research communities***

Knowledge is widely recognized as the most strategic asset in any organization (Kuo et al., 2019). This is particularly true for research (or epistemic) communities where knowledge resides and articulation and knowledge creation can take place (Haas, 1992). Research communities are generally considered as knowledge intensive organizations engaged in producing, promoting and sharing scientific knowledge (Håkanson, 2010). The main purpose of the scientific communities is to create knowledge and make it easily usable, systematized and replicable. This principle is based on the "knowledge-based view" according to which explicit knowledge is easier and less costly to pass on and replicate than is tacit knowledge (Winter, 1987).

The importance to manage knowledge as a strategic resource for scientific development have long acknowledged. Advances in digital technologies offer the opportunity to face the proliferation of information emerging as results of scientific research. In this context, the exploitation of methods and tools for data extraction, analysis and visualization represent a fundamental approach to support scientific knowledge management, defining new ways of knowing and producing knowledge.

As stated by Shahid et al. (2020) extracting relevant knowledge from scientific publications is an increasing challenging task, given the proliferation of published works. Currently available systems provide researchers with huge lists of results that must be manually explored. Recently, several authors suggested approaches to select relevant scientific publications (Habib and Tanvir, 2017; Waheed et al., 2019; Wan et al., 2019). The different methods proposed converge in highlighting the importance of considering content, citations and editorial collocation in the selection criteria.

Data analysis and visualization has been pointed out as an essential dimension of modern knowledge management to support decision making in organizations

(Lurie and Mason, 2007; Schiuma et al. 2012; Miah et al., 2017). In this sense, many approaches supporting individuals along the knowledge value chain have been proposed.

Knowledge extraction, analysis and representation are particularly meaningful in scientific research since the research landscape is becoming more and more dynamic, transdisciplinary and characterized by the interaction among several stakeholders.

## ***2.2 Systematizing knowledge in scientific community: an analysis of review-based approaches and tools***

Review-based research is considered a valuable tool allowing scholars to identify research gaps, new research directions and emerging theoretical frameworks (Marabelli & Newell, 2014). The need to evaluate and synthesize extant research in a reproducible and transparent way (Vrontis and Christofi, 2019; Kumar et al., 2020) is prompting many researchers to propose methods aiming to provide guidelines to carry out review-based research (Palmatier et al., 2018). Several approaches for review-based research have been proposed in literature. The choice of the approach to be adopted mainly depends on the type of objective to be pursued and the maturity level of scientific research in the reference domain to be analysed (Snyder, 2019)

Systematic literature review (SLR) is a procedure that collect and synthesizes contributions and scientific evidence to answer a certain research question with particular attention to the sources, which must be highly referenced in order to assess high quality in the process of identify, highlight and evaluate all the evidence regarding the specific topic.

SLRs was originally implemented for investigating scientific literature in health sciences, but it has become an established methodology in the management field as of the previous literature review process (Tranfield et al., 2003).

Several approach for SLR are provided in literature. Paul and Criado (2020) classified SLR articles into three main categories, namely theory-based, method-based and domain-based approach. Theory-based review articles aim to synthesize and help advancing a body of literature that uses and/or empirically applies a given underlying theory (Hassan et al., 2016; Gilal et al., 2019). Method-based review papers aim to synthesize and extend a body of literature using an underlying quantitative or qualitative methodology (Sorescu et al., 2017; Ji et al.,

2019). Domain-based review articles aim to identify research gaps with reference to methods, theories and constructs based on the compiled information in a specific domain (Paul & Feliciano-Cestero, 2020). Through this approach, researchers aim to organize, analyze, and discuss existing literature on the basis of theoretical themes or concepts that are considered relevant for a given domain. Domain-based review articles can use Framework-based approaches (e.g. Antecedents, Decisions and Outcome (ADO), Theory, Construct, Characteristics and Methodology (TCCM)) to model knowledge in a specific domain (Sharma et al., 2020).

Several tools have been proposed to support researchers in systematic literature reviews through the application of the LDA algorithm, some focusing on automating the literature review phases, others on graphical presentation of the results using illustrations such as dendrograms or result comparison matrices (Talafigaryani, 2021; Lakshmi Prasanna et al., 2019; Mo et al., 2015). However, the same authors highlight some limitations concerning, for example, the use of the tools by expert researchers or the absence of comparative performance analysis of different topic modelling configurations or algorithms such as LDA and Mallet (Tauchert et al., 2020; Asmussen et al., 2019).

### **3 Towards an automated methodology for Systematic Literature Reviews**

#### ***3.1 The proposed method***

In what follows, we attempt to provide an answer to RQ1, characterizing the process of SLRs according to a knowledge management perspective. According to the principles of SLRs in management studies made by Denyer and Tranfield (2009), SLR-based works are generally organized in the following steps, namely papers location and selection, papers analysis, results synthesis.

##### ***3.1.1 Papers location and selection***

The review of the literature process in the initial phase involves the identification of a large number of articles. The search process is usually conducted using repositories such as Web of Knowledge or Scopus. However, defining the correct keywords and selecting the suitable papers can be challenging and time-consuming (Ishida et al., 2020).

The process continues with selecting a limited number of articles for in depth review. The inclusion and exclusion criteria are defined after the search question has been finalized but must be applied before the search is carried out. Inclusion and exclusion criteria can be generic such as publication year, language other than English, but they can also be more restrictive to the point of selecting articles published in academic journals and journals with impact factors indexed in certain Citation Reports (Ammirato et al., 2020).

According to a knowledge management based perspective, this phase addresses the need to extract relevant knowledge from scientific publications. As suggested by extant literature, metadata analysis is crucial to find an appropriate set of paper to be analysed. The systematic literature review, in the screening phase, allows the automatic identification of contributions ordered by relevance (citations, journal ranking, etc.) according to some well-defined protocols (Barza et al., 2009; Boudin et al., 2010).

### *3.1.2 Papers analysis*

The aim of the analysis is to examine and dissect individual studies and explore how the components relate to one another. This phase deals with the definition and the application of appropriate methods to analyze selected documents. Until now, the management of large collections of articles has been organized and treated by topic using spreadsheets (Demner-Fushman and Lin, 2007), dictionaries or supervised methods (Jones and Baumgartner, 2005). These methods are quite expensive and require a priori knowledge of the topics and the research domain. Thanks to the recent development of machine learning techniques, many activities of the review process can be automated to reduce the researcher's burden and times (King and Lowe, 2003). This phase addresses the need to analyse available data to create new knowledge.

### *3.1.3 Results synthesis*

Synthesis is a process of putting the findings from individual studies together *"into a new or different arrangement and developing knowledge that is not apparent from reading the individual studies in isolation"* (Denyer & Tranfield, 2009, p. 685). Narrative approach is the most common method to synthesize SLR results in management field of study (Paul and Criado, 2020). This approach attempt to address different aspects of the same phenomenon and build them into a bigger picture, map, or mosaic (Hammersley, 2001). According to a

knowledge management based perspective, knowledge visualization offer scholars the opportunity to understand greater insights and perspectives surrounding a given topic. This help researcher to describe and synthesize results of SLR.

### **3.2 SMILE Architecture**

The SMILE tool is developed in Python through the Django framework. It is equipped with a graphical interface that simplifies the operations of research and extraction of contributions from the most relevant scientific databases.

SMILE implements the SCOPUS and Web of Science REST APIs to retrieve information and it enables search on different levels:

- Search API, used to launch a general search on abstracts, titles and keywords;
- Abstract retrieval API, the API interface to retrieve abstract documents;
- Citation Overview API, used to perform queries on citation counts broken down by year.

The definition of an appropriate initial set of keywords is crucial for knowledge extraction (Rose and Kitchin, 2019). The choice of keywords to include in the query string is decisive for the direction of research, as not all journals provide guidelines or recommendations on the choice of keywords to associate with articles leaving to the authors the freedom of choice. For this reason, some keywords are not included in the title or abstract but they appear with synonyms.

SMILE also allows the launch of new searches by modifying the initial set of keywords by suggesting new keywords discovered in the titles and abstracts identified by the previous search. On each launch the tool simulates the behavior of the model in terms of perplexity and coherence in order to support the researcher with a stop condition to move on to the next steps.

#### **3.2.1 Documents selection**

The next step of the methodology provides support on location and classification of papers over the selected scientific databases available. The tool initially allows the search string building in order to query the SCOPUS and Web of Science databases to create the main corpus used by LDA genism algorithm. Based on the results obtained, it subsequently allows the application of further filters to refine the search and improve the quality of the results in terms of

citations and journal impact factor. In particular, Source Normalized Impact per Paper (SNIP) is associated with each contribution from SCOPUS database. The SNIP parameter measures contextual citation impact in a subject field using Scopus data.

For contributions extracted through query strings from the Web of Science database the Journal Impact Factor (JIF) is associated.

### 3.2.2 LDA technique

Topic modelling using LDA technique is a very popular approach for inference of topics and semantic analysis and exploration. The LDA approach, thanks to its adaptability, has allowed the start of numerous contributions in classifying documents (Kraus et al., 2020) or scheduling of information extraction systems (Ionescu et al., 2015).

The main representation of LDA, as described in (Blei et al., 2003), is a Bayesian model in three-level hierarchy, in which each item of a collection is modelled as a finite mixture over an underlying set of topics (Nahar et al., 2018). In LDA  $k$  topics  $\phi_k$  with  $k \in \{1, 2, \dots, K\}$  are representative of a discrete distribution over a fixed vocabulary of words.

Compared to pLSA (Probabilistic Latent Semantic Analysis), LDA introduces two hyper parameters  $\alpha$  and  $\beta$  of Dirichlet types extending the model with generative capability of inferring the topics on new documents (Deerwester et al., 1990).

The following pseudocode illustrates the general flow of the LDA algorithm:

---

```

for all  $k = \{1, 2, \dots, K\}$ 
    generate  $\phi_k \sim \text{Dirichlet}(\beta)$ 
end for
for each document  $d$ 
    generate  $\phi_m \sim \text{Dirichlet}(\alpha)$  over topics
    for each word  $w$  in document  $m$ 
        sample a topic  $x_{wd} \sim \text{Dirichlet}(\phi_d)$ 
        sample a topic  $y_{wd} \sim \text{Dirichlet}(\phi_{x_{wd}})$ 
    
```

---

SMILE adopts a method for systematic literature review conducted through machine learning (ML) for natural language processing (NLP) and text analytics technique. In particular the authors developed a software tool that implements LDA (Latent Dirichlet Allocation) topic modeling technique to identify dominant

topics and relevant contributions for each topic discovered by Gensim and Mallet LDA implementations. Gensim is an open-source Python library (Nahar et al., 2018) that includes word2vec algorithm, latent semantic analysis and LDA.

#### **4 An application of the proposed approach**

We carried out an application of the proposed approach by carrying a domain-based systematic literature review to investigate the impact of Industry 4.0 in human resources management.

Innovative technologies that belong to the Industry 4.0 paradigm such as Artificial Intelligence, Internet of Things, Cloud and Big Data are influencing and automating most Human Resources processes towards more efficient work teams' management (Xu et al., 2018). The development of new technologies that enables smart working are generating a significant impact on changes in large as well as small and medium-sized enterprises (Sommer, 2015), as well as with the introduction of these new technologies in work places also employee's working conditions and approaches are changing (Lasi et al., 2014). The purpose of the application of the new tool to HR4.0 is to investigate and analyze influences on all phases of Human Resource Management in the context of Industry 4.0 in order to identify greatest impact technologies and directions for further research.

An initial set (I) of keywords was defined based on previous literature on Industry 4.0 and Technological Innovation in Industry domain. A second set (H) of keywords related to Human Resources Management synonymises was also defined to be used in combination with set I in order to query the selected scientific databases.

The procedure of documents extraction was implemented using Pandas library to archive information in Data Frames through Scopus and Web of Science web services through API rest. The figure below explains how LDA process work over a document collection.

Figure 1 - LDA approach with latent variables (topics) vs Bag-of-words approach

The LDA technique is able to map each document to its corresponding topic based on the probability distribution of the document over  $k$  topics, obtaining a vector of length  $k$  for each document as shown in *Table 1*.

Table 1 - Probability distribution of the document over  $K$  topics

	Topic 1 (HRM)	Topic 2 (Industry 4.0)
<b>Document 1</b>	0.9	0.1
<b>Document 2</b>	0.2	0.8
...		
<b>Document N</b>	0.3	0.7

A user-friendly graphical interface has also been implemented in order to facilitate the systematic literature review process and displaying results in a web environment.

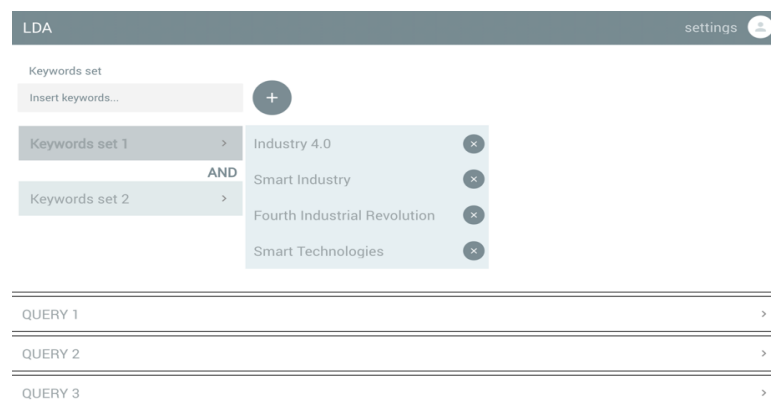

Figure 7 - Web interface of the tool for the search query string building

The main reason for using an automated procedure for extraction was to build a set of documents in a compatible format with the Python libraries used in the systematic literature review process. The automated procedure also allowed a metadata analysis with detection of new keywords included in the query string. After several runs of the extraction script, we built a starting sample of 3387 documents.

In order to select only documents relating to the research domain and achieve high scientific quality, the query string has been refined with "publication type" and "subject area", selecting respectively only academic journals and "management", "business", "economics" and "business finance" both for Scopus and Web of Science databases.

As a result, a total amount of 899 papers net of any duplicates over the two scientific databases has been included for the subsequent analysis phases (846 Scopus, 286 WoS, 233 duplicates).

#### **4.1 Topic modeling evaluation**

##### *Perplexity*

Perplexity is a statistical measure of how well the probability model predicts a sample. As applied to LDA we can estimate the LDA model for a given value of  $k$ . Then given the theoretical word distributions represented by the topics, compare that to the actual topic mixtures, or distribution of words in documents.

The benefit of this statistic comes in comparing perplexity across different models with varying  $k$ . The model with the lowest perplexity is generally considered the "best" (Scaccia and Scott, 2021).

##### *Topic coherence*

Topic coherence measures the degree of semantic similarity between high scoring words in the topic. This coefficient helps measure model quality by distinguishing arguments that are semantically interpretable arguments from statistical inference artifacts (Xi and Allan, 2008). As an early intrinsic method, Alsumaith et al. (2009) defines measures based on three prototypes of junk and insignificant topics. The three prototypes for "junk distribution topics" are the uniform word-distribution, the empirical corpus word-distribution, and the uniform document-distribution:

$$p(w|topic) \propto 1 \quad p(w|topic) \propto \text{count}(w \text{ in corpus}) \quad p(d|topic) \propto 1$$

Then a topic significance score is computed from various dissimilarities and similarities (KL divergence, cosine, and correlation) to these three prototypes. However, the significance score is a complicated function with free parameters that seem to be arbitrarily chosen, so the risk of overfitting the two datasets used for experiments is high.

Figure 2 - Optimal number of topics for the model with coherence score evaluation

#### 4.2 Analysis and findings

In this section, we report all findings based on the analysis of topics discovered by Mallet LDA. Each document is composed of multiple topics contributions, but is possible to identify the dominant topic by weighting the topics and the keywords for each sentence. This procedure allows the association of each contribution to the dominant topic. This facilitates the exploration of the contents that can be classified by relevance in terms of citations and journal impact factor.

Document_No	Dominant_Topic	Topic_Perc_Contrib	Keywords
0	1.0	0.6219	firm, management, technology, industry, high, performance, research, company, work, organization
1	3.0	0.5174	Industry, innovation, development, product, process, project, system, university, knowledge, technology
2	3.0	0.4446	Industry, innovation, development, product, process, project, system, university, knowledge, technology
3	0.0	0.4456	Construction, american, machine, plant, robot, cost, operation, environmental, soviet, defence

Figure 3 - Dominant topic for each document

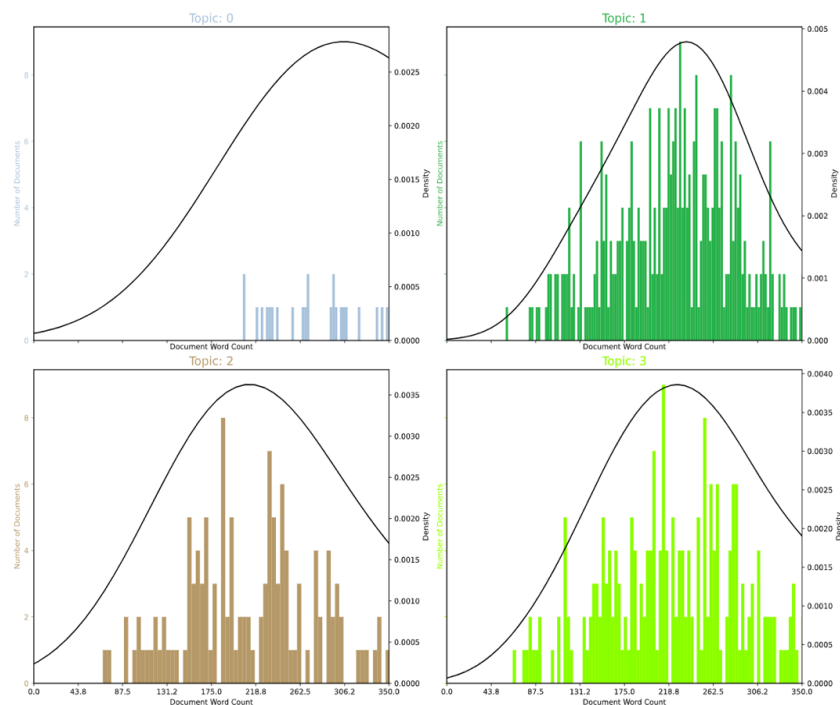

Figure 4 - Word count and importance of keywords per topic

Figure 4 shows word counts distribution for each topic extracted, this representation is useful to the researcher in the analysis phase to know how big the papers are as a whole and also by theme or topic.

The weights of the keywords and how frequently words appear in the papers is also indicative to evaluate the coherence of the model in relation to the research domain., as shown in figure 5.

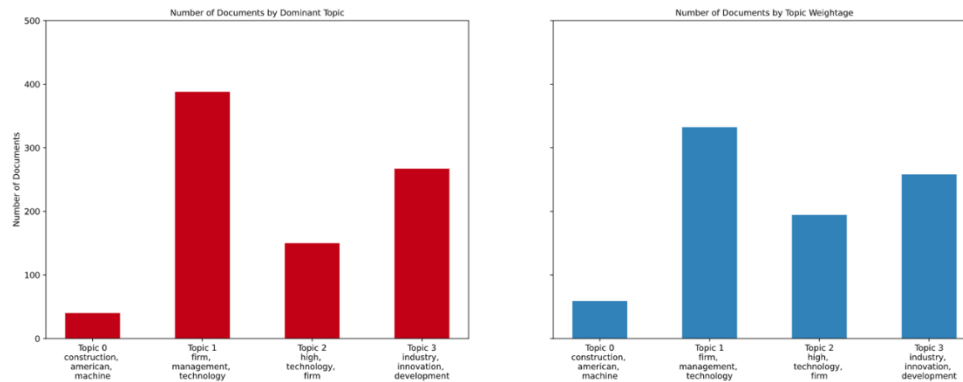

Figure 5 - Word counts and the weights of each keyword

Through pyLDAVis, a most commonly used graphical tool contained in Gensim Python library, is possible to explore in HTML the content for each topic. The graphic and interactive exploration in the web environment offers the researcher the possibility to compare the different topics discovered by the tool in a single view window, facilitating the analysis of the entire base of contributions.

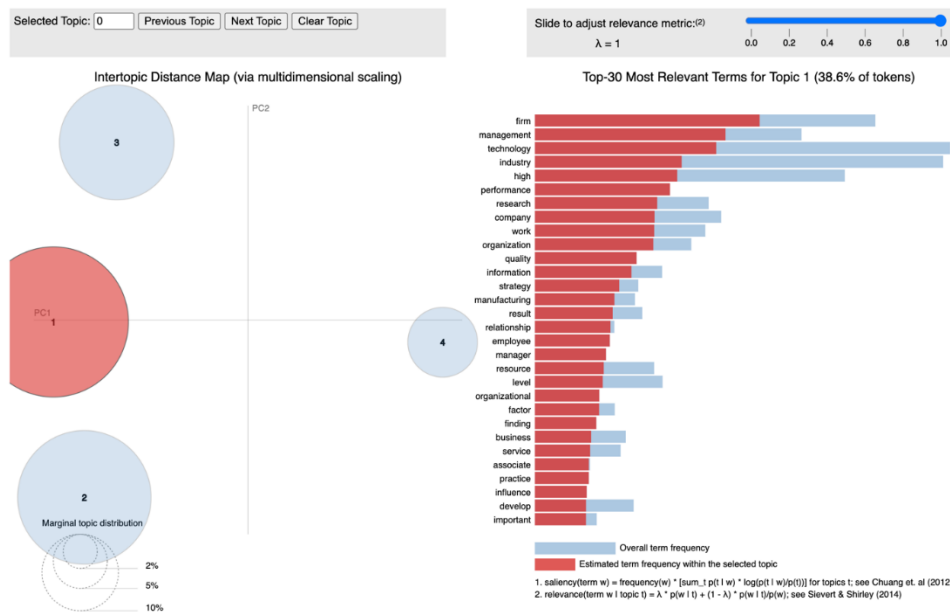

Figure 6 - HTML topic exploration tool

Figure 7 - t-SNE 2d visualization

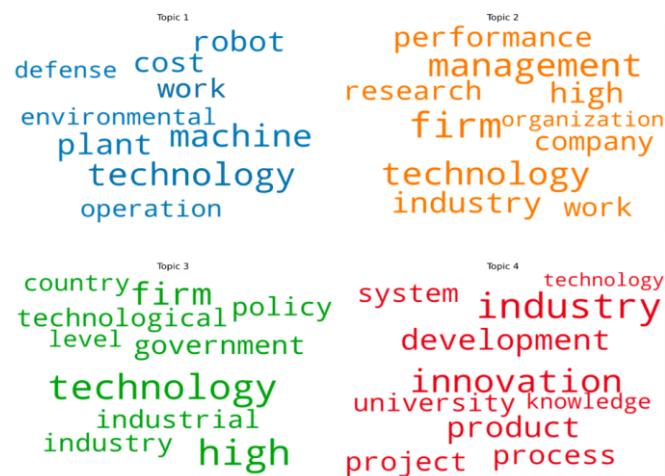

Figure 8 - Word clouds per topic

As presented in Figure 7, the tool allows the visualization of clusters of documents in 2D space through the t-distributed stochastic neighbor embedding (t-SNE) algorithm.

We used as title for each topic a description based on the most representative text identified by the LDA procedure, also using words clouds with the size of the words proportional to the weight in each topic. A brief description is provided in the following table.

Table 2 – A brief description of the identified topics

Topic	Keywords	Description
Topic 1	machine, plant, robot, cost, operation, environmental, sustainable, human health,	Identification of environmental effects in the application of new technologies for sustainability and the improvement of working conditions
Topic 2	firm, management, technology, industry, high, performance, research, company, work, organization, readiness	Industry 4.0 readiness assessment based on the current organizational structures in companies and employees' perspective, supporting staff with material reward and career development opportunities or reducing workload by assigning appropriate task.
Topic 3	high, technology, firm, government, policy, industrial, industry, technological, country, level	Analysis of the relationships between local policies to encourage the use of new technologies and the implementation of industry 4.0 development paradigms in companies
Topic 4	industry, innovation, development, product, process, project, system, university, knowledge, technology	University - Industries collaboration aims to improve companies readiness to industry 4.0 thanks to targeted recruitment systems and continuous training on new technologies

## 5 Conclusions

The rapid growth of scientific publications evidently calls for a systematization of the available body of knowledge (Shahid et al., 2020). Several challenges for research, such as poor theory understanding and lack of novelty emerge especially when scholars do not have a systematic understanding of the underlying body of knowledge (Paul and Criado (2020). High quality, systematic review papers and meta-analyses can provide this state-of-the-art understanding to scholars and thus play an important role in a discipline's progress. Systematic literature reviews represent an important approach to understand extant business research and to provide ideas and directions to undertake novel studies, instead of doing replete and recycled types of research.

Although several approaches are available for SLRs, a clear definition of how SLR can contribute to value creation in the scientific knowledge management process is still missing. With this paper, we tried to fill this gap. As first result of

our research, we structured and systematized the SLR methodology in order to clear connect it to the phases of the research process according to the knowledge management perspective.

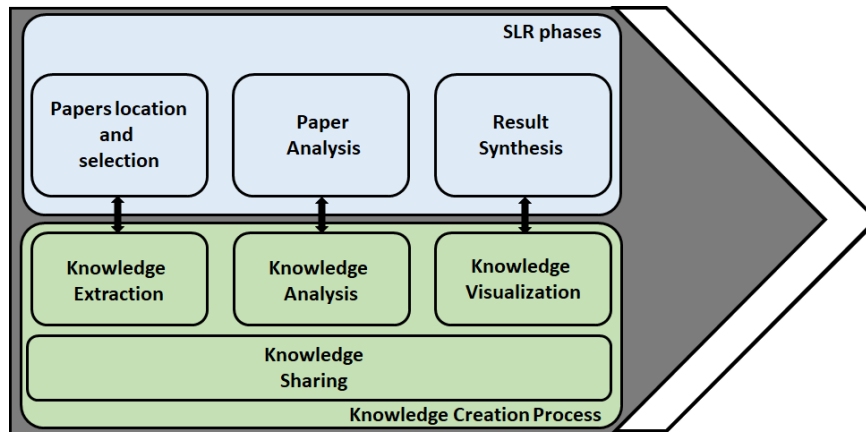

Figure 8 – The interrelation between SLR phases and the Knowledge Creation Process

Moreover, while in the past much attention has been paid to tools supporting the analysis of bibliometric networks (such as co-authorship, bibliographic coupling, and co-citation networks) (Perianes-Rodriguez et al., 2016), much less attention has been paid to the design of software tool supporting researchers throughout literature review process.

The second result of our research was specifically thought to overcome this further limitation. We implemented a DSS tool useful to automate some step of the SLR methodology and support the decision process of researchers along the four phases of the knowledge creation process we identified. A synthesis of the main advantages provided by SMILE is provided in the following table.

Table 3 – Main features provided by SMILE

Knowledge creation Process phase	Tool Features
Knowledge Extraction	<ul style="list-style-type: none"> <li>- Support in keywords definition</li> <li>- Support in search string building</li> <li>- Automated search and extraction from WoS and Scopus scientific databases.</li> </ul>
Knowledge Analysis	<ul style="list-style-type: none"> <li>- Choosing among several classification algorithm</li> <li>- Comparing classification results</li> </ul>

	- Topic description
Knowledge Visualization	- Keywords and topics statistics
	- HTML topic exploration tool
	- t-SNE 2d visualization
	- Word clouds for each topic
Knowledge Sharing	- Share results among research group members

In order to facilitate scholars in carrying out SLRs based research, a tool implementing an interactive procedure that allows researchers to supervise all the fundamental phases envisaged by the SLR has been presented. The tool, starting from a set of initial keywords, allows to modify the search query and to interactively evaluate the research results.

The optimal number of topics  $k$  is calculated for each query, as well as the coherence coefficient based on the LDA technique evaluation. The representative text for each topic is also shown in order to verify the consistency of the methodology with respect to the main topic.

The current version of the tool allows the choice between two options (Gensim LDA and Mallet LDA) of the algorithm that best classifies the contributions and discovers research topics based on coherence coefficient, overcoming the limitations of the tools currently available as highlighted by different authors (Tauchert et al., 2020; Asmussen et al., 2019). The feature of the tool of comparing the results of different algorithms on the same corpus opens the doors to a possible future development of the methodology, represented by the implementation Latent Semantic Analysis (LSA), pLSA (probabilistic-LSA) or any other machine learning algorithm for knowledge extraction from scientific literature.

According to a Knowledge-based view of scientific organizations (Cummings and Kiesler, 2014), SMILE provides a boost for the continuous acquisition and transfer of knowledge among scientific community members. Universities and Research Institutions build their knowledge by recording it as papers, documents, books, etc. Access to this knowledge for researchers and students is essential for continuous growth. Also important is the access to tools that enable knowledge extraction and facilitate the creation of shared knowledge repositories.

**Funding:** This research was partially funded by MISE (Ministero Italiano dello Sviluppo Economico) under the project "SMILE – Strumenti e Metodi Intelligenti per la digital Enterprise": CUP B21B19000530008.

### Abstract

The ongoing pandemic has forced public and private organizations to shift from in-person to virtual teaching and learning, giving new emphasis on the usefulness of virtual learning spaces. (Karam et al., 2021; Krishnamurthy, 2020)

In such a context, how to assess the performances of virtual learning spaces has become a key topic. Despite that, to date assessing the performances of virtual learning spaces remains under-investigated.

This study proposes a conceptual framework that highlights the relevant variables and dimensions of a virtual learning space (VLS) to assess. For this purpose, the study combines a theoretical approach with empirical evidences. First, a literature review is carried out to describe learning spaces, their features and forms, and their main performance dimensions. Then, a conceptual framework for assessing virtual learning spaces performances is developed. The framework is tested on a case example that allowed to enrich the

theoretical insights with practical findings. The theoretical findings suggest specific variables and dimensions to consider in assessing learning spaces supported by digital technologies. Moreover, the paper provides managers with a conceptual framework for the assessment of the performances of virtual learning spaces.

**Keywords** – learning spaces; virtual; performance evaluation; knowledge; decision-making.

**Paper type** – Academic Research Paper

## 1 Introduction

Active learning approaches are acquiring growing importance in the current scenario, favoring the emergence of innovative learning spaces (LS) (Alstete and Beutell, 2018, Ellis and Godyear, 2016) These spaces are oriented and designed towards the learner and the learning process, with particular attention on learning mechanisms and teaching goals. An LS is a space of action and interactions and its key features influence the learning processes and knowledge creation and exchange processes.

Recently, virtual learning spaces (VLS) took hold (Marconato, 2014). A VLS is a combination of elements enhancing the learning process, with a strong technological component.

The ongoing pandemic has emphasized the usefulness of these spaces (Karam et al., 2021; Krishnamurthy, 2020), as it has forced public and private organizations to shift from in-person to virtual teaching and learning.

Given the new emphasis on the relevance of VLS, how to assess their performances and effectiveness has become a key topic that is gaining growing attention. (Karam et al., 2021; Krishnamurthy, 2020; Grigol et al., 2014).

In this perspective, several authors propose some examples of evaluation frameworks, such as: i) the SAMR model, based on an ex-ante selection of technologies to implement in VLS; (Hamilton et al., 2016) ii) the Confirmatory factors model with a stakeholder-oriented perspective; (Selim, 2007) iii) the conceptual framework for hybrid distance delivery (Piccoli, 2001), and iv) the Web-based virtual learning environment (Dennis et al., 2002), both mainly focused on the ex-post effectiveness of VLS.

Despite this, performance assessment of VLS remains under-investigated. To the best of our knowledge, indeed, to date most of literature is focused on the

description of these spaces. In this vein, this study proposes a conceptual framework that highlights the relevant variables and dimensions to assess a VLS.

In particular, the study tries to answer the following research question (RQ): What are the essential dimensions to consider for a comprehensive assessment of a virtual learning space's performances? For this purpose, from a methodological point of view, the study combines a theoretical approach with empirical evidence. First, a literature review regarding learning spaces, their features and dimensions is carried out. Then a conceptual framework is developed. The framework draws on the logic underpinning the Balanced Scorecard (Kaplan and Norton, 2004).

The framework's purpose is to guarantee and enhance the effectiveness of a VLS. In this vein, it supports the identification of the relevant dimensions of a VLS that should be evaluated in an ex-post perspective.

The model, indeed, includes four main pillars, i.e. i) physical dimension; ii) relational dimension; iii) virtual dimension and iv) learning atmosphere and competencies. Lastly, the framework is tested through a case study that allowed to enrich the theoretical insights with practical findings.

The research results synthesize data and knowledge gathered from the literature review and the empirical case study and offer implications and insights both for theory and practice. The findings suggest specific variables and dimensions to consider in assessing learning spaces supported by digital technologies. Therefore, the paper provides managers with a conceptual framework for the assessment of the performances of a VLS.

The paper is organized as follows. In the next section, a theoretical background discussing the role and relevance of LS and VLS is presented. Then, the essential dimensions to consider for a holistic assessment of VLS performances are identified and described. The third section describes the conducted case study and discusses the results. Finally, theoretical and practical implications, as well as future research directions are illustrated.

## **2 Theoretical background – Role and relevance of learning spaces**

Nowadays, the traditional teaching model, lecturing, is becoming outdated, favouring the emergence of new perspectives. Different researchers (Alstete and Beutell, 2018, Raelin and Coghlan, 2006) claimed the importance of incorporating active learning possibilities in addition to the lecture method, (i.e. team exercises, cases presentations, class debates) facilitating interactions and relationships

between students and between students and teachers. Active students' participation in learning helps in creating and constructing knowledge. Active learning involves students in the learning process dynamically and experientially. When students are engaged with this methodology, they are more likely to retain what they have acquired and to achieve positive impacts on learning outcomes. (Karam et al., 2021)

Kickul and Fayolle (2007) asserted the importance of a complete shift from passive teaching to an active learning perspective. The latter is less oriented towards narrow and specialized-based approaches whilst it is more focused on contents and processes organized by the students and aimed at achieving learning outcomes.

According to the emergent perspectives, lecturing may continue to be a common practice in education, but it will be considered as a part of the pedagogical repertoire, integrated with more active learning approaches and innovative tools (Alstete and Beutell, 2018). In consequence, traditional classroom spaces are increasingly considered ineffective in supporting and favouring the achievement of learning outputs because they make too easy the knowledge broadcasting or "delivery" in a unidirectional flow of communication (Long and Ehrmann, 2005). Classroom design is, in fact, more oriented to space itself and not to the learner and the learning process (Alstete and Beutell, 2018).

Therefore, a relatively new research stream, namely learning space (LS), is acquiring increasing importance. Recalling Kurt Lewin's equation  $B=f(p,e)$  (i.e. B=behavior, p=person, and e=environment), a learning space may be conceptualized as a space of interactions among the individuals and the environment. In this perspective, the design and planning of learning spaces are driven by these interactions (Morris, 2019; Ellis and Goodyear, 2016). These spaces are oriented and designed towards the learner and the learning process.

Rigidity, immobility, discipline and control are substituted with flexibility, functionality, participation and empowerment (Santoian, 2012). Generally, according to Long and Ehrmann (2005), the architecture of the LS is no longer a container in which teaching and learning happen but it may provide several dimensions to support learning. The structure of a learning space, indeed, includes mutually influencing interactions between different kinds of nested dimensions and learning outputs. (Ellis and Goodyear, 2016) Therefore, the LS is a space of action and interactions; it is not static and neutral because its structure, its quality and its predisposition are key features influencing the learning

processes and the knowledge creation and exchange processes. Loiero (2008) claimed that developing effective learning spaces means focusing attention on the ways to create learning opportunities in a context where to learn and grow.

This perspective leads to the possibility of widening the definition of LS, considering further forms of LS, namely, i) Ba in organizations and ii) innovative milieu.

In knowledge management literature, Ba is a place or a field, where people learn and co-create knowledge. In an organization, the Ba can be composed of members with different ideas, experiences, sensitivities and ways of thinking. Consequently, members hold different kinds of knowledge that, combined and exchanged, create a source of innovation. The people participating in a Ba exchange knowledge through interactions and relationships because each individual can see himself in relation to the others and be engaged in understanding different points of view and values. Moreover, Ba can be a physical, virtual or cognitive space as well as it can be a formal or informal context. (Nonaka and Tacheuchi, 2019)

Regarding innovative milieu, several scholars describe this milieu as characterized by intense transfers of knowledge and learning processes, facilitated by technological dynamics and a common cultural, psychological, and political background (Maennig and Ölschläger, 2011). Another relevant element is the perception of the common image and an internal sense of belonging, enhancing common rules of conduct and value systems. (Camagni, 2004) An Innovative milieu facilitates social contacts, integration, the interaction of actors, and the creation of synergies. Therefore, milieu encourages innovation, diminishing uncertainties and accelerating collective learning processes. (Ejermo et al., 2015; Maennig and Ölschläger, 2011)

The review of literature suggests that a learning space can be defined as a space of action and interaction between individuals that drives knowledge creation and transfer and learning dynamics. These dynamics may be activated in formal and informal spaces, including several nested dimensions, namely: i) a flexible physical space; ii) a technological dimension, including tools for distance learning as well as tools supporting face-to-face interactions; iii) a motivating and creative atmosphere, reinforced by human capital's competencies; iv) strong relationships, synergies and sense of belonging. These dimensions characterize the learning dynamics that can result in positive and effective impacts on the

learning process. (Silva et al., 2019; Ejermo et al., 2015; Grigol et al., 2014; Maennig and Ölschläger, 2011; Santoianni, 2012)

### **2.1 Virtual learning spaces**

The reorganization of spaces oriented towards the learners and the learning process, gives emphasis to the diffusion of LS supported by innovative and digital tools, namely virtual learning spaces (VLS) (Marconato, 2014).

The ongoing pandemic has forced public and private organizations to shift from in-person to virtual teaching and learning. COVID-19 has altered the educational and training landscape and forced learning and training environments to quickly evolve to meet new unexpected challenges and to fully exploit digital technology for training purposes. Indeed, the digital transformation in education and training and the creation of virtual learning spaces are not new. The pandemic has just given a new emphasis on the usefulness of these spaces (Karam et al., 2021; Krishnamurthy, 2020).

Generally, a VLS is a LS with a strong technological component, that may enhance the learning process. Given the inclusion of several technological tools, a VLS is not limited to the boundaries of a physical space, but can connect remote realities.

VLSs have some specific components and features, such as: i) they are designed information space; ii) they include an explicit representation through several modalities, e.g. texts, graphic interface, 3D immersive worlds; iii) they are not limited to distance education, but may enrich classroom activities and be overlapped with the physical environments; iv) they integrate heterogeneous technologies with multiple pedagogical approaches (Murugaiah and Yen., 2019; Dillenbourg et al., 2002). Therefore, a VLS does not guarantee effective learning processes per se; pedagogical scenarios must be integrated with the choice of suitable technological tools. In this regard, new digital technologies have the potential to become powerful and potential changing agents and strategic allies for sustainable and inclusive development of innovative, cheaper and more user-friendly learning spaces and effective knowledge creation and exchange.

Accordingly, given that VLS are characterized by high knowledge intensity dynamics and activities, (Alexandropoulou et al., 2009; Veer-Ramjeawon and Rowley 2020), they may be supported by knowledge management systems (KMS).

Generally, several authors agree in defining KMS as technological and organizational tools and practices supporting and facilitating KM processes. They aim to optimize the knowledge resources use, activating innovation dynamics and improving companies' performances, efficacy, and effectiveness (Corso et al., 2003). Accordingly, two essential components of a KMS are KM-Practices and KM-Tools. KM-Practices are methods and techniques supporting KM processes (i.e. creation, storage, and transfer) whilst KM-Tools are organizational tools and digital technologies assisting KM-Practices. Therefore, the development of VLS can be supported by KMS, integrating technological and organizational tools and practices enhancing knowledge and learning dynamics.

#### *2.1.1 Assessing VLS performances*

Given the new emphasis on the relevance of the VLS, how to assess their performances has become a key topic (Karam et al., 2021; Krishnamurthy, 2020; Grigol et al., 2014).

Several authors propose some examples of frameworks evaluating one or more dimensions of a VLS, namely: i) Substitution, Augmentation, Modification and Redefinition (SAMR) model (Hamilton et al., 2016); ii) Confirmatory factors model (Selim, 2007); iii) a conceptual framework for hybrid distance delivery (Piccoli, 2001 and iv) Web-based virtual learning environment (Dennis et al., 2002).

In particular, the "SAMR" model is a four-level framework, based on a taxonomy approach for an ex-ante selection of technology to use in VLS. The SAMR model is increasingly popular among practitioners (Hamilton et al., 2016).

The "Confirmatory factors model identifies e-learning critical success factors" within universities, grouped into 4 categories: instructor, student, information technology, and university support. (Selim, 2007) The model is based on a stakeholder-oriented perspective, in particular the students' perspective.

The "model for hybrid distance delivery" is mainly focused on learning effectiveness emphasizing hybrid distance delivery (Dennis et al., 2002). Lastly, the "web- based virtual learning environment" is developed in the context of basic information technology skills training. (Piccoli, 2001) The last two models are focused on the ex-post effectiveness of VLS, describing and evaluating the relationships between several factors influencing the learning processes.

The models presented need to be renewed and adapted to the recent scenario. The SAMR model lacks a solid literature foundation. Critics about the SAMR model are focused on its absence of context, its hierarchical structure, and the

emphasis placed on product over process (Hamilton et al., 2016). The other three models identify some of the key dimensions to evaluate in a VLS, however, they are mainly linked to distance learning and e-learning. Moreover, they are based on basic technological tools (i.e. emails, videoconferencing, chat) without considering the emergence of several innovative digital technologies because they were developed during the early XXI century (Selim, 2007; Dennis et al., 2002; Piccoli, 2001).

Therefore, to date, the performance assessment of VLS remains under-investigated and fragmented.

In this vein, this study proposes a conceptual framework that highlights the relevant variables and dimensions to assess performance of a VLS. In particular, the study tries to answer the following research question (RQ): What are the essential dimensions to consider for a comprehensive assessment of virtual learning spaces' performances?

In this perspective, this study discusses the opportunity to readapt the BSC to the VLS setting (Kaplan and Norton, 2004). The BSC has been chosen for its acknowledged effectiveness in assessing public and private organizations' performances. It is, indeed, a performance evaluation model and a management tool that translates the organizational strategy into objectives and measures accessible to all the stakeholders. In this vein, it fosters a continuous dialogue between all the individuals and it pays great attention to the measure of the intangible assets.

The conceptual framework developed for the aim of this paper proposes the same structure of the BSC, adapting and modifying its relevant dimensions to fit in a VLS setting (Kaplan and Norton, 2004).

The resulting conceptual framework has the purpose to guarantee and enhance the effectiveness of a VLS supporting the identification of its key dimensions, that should be evaluated in an ex-post perspective. In this vein, it may support the decision-making process, that assumed strategic importance nowadays, providing organizations with key data and knowledge to make informed decisions and plans.

The proposed conceptual framework, includes four main pillars; i.e. a) physical dimension; b) relational dimension; c) virtual dimension and d) learning atmosphere and competencies. In the following, the dimensions are briefly discussed.

## **2.2 Physical dimension**

The physical dimension of the VLS any space where an individual learns, such as a classroom, an external place, a lab or an informal location. In this vein, informal spaces for collaboration and learning are relevant and essential for the enhancement of the learning processes (Alstete and Beutell, 2018). Generally, the physical design should favour flexibility and creativity. A smart and comfortable design, associated with an adjustable and wide layout, should be preferred over anonymous and "box-type" spaces. Internal and external design elements, characterizing the space, should be blended into a synergistic whole.

## **2.3 Relational dimension**

The relational dimension is highly influential. VLS should facilitate interactions, teams' cooperation and the emergence of heterogeneous ways of expression. (Silva et al., 2019; Santoianni, 2012) Internal and external relationships favour learning and knowledge dynamics creating stimulating and motivating environments. (Mosa and Tosi, 2016) The relationships considered are those between peers, those with external stakeholders and those between learners and teachers. In this vein, teachers become facilitators of interconnected learning, and develop relationships of trust and respect with the learners. They become active agents of change to respond to the demands of a global world. (Silva et al., 2019)

## **2.4 Technological dimension**

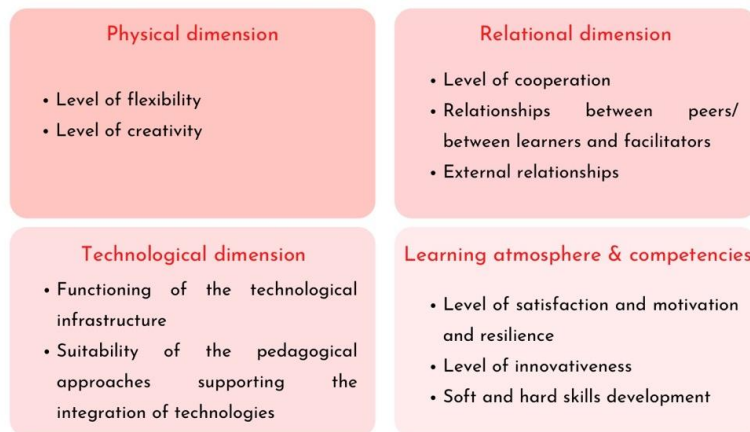

The importance of the technological dimension must be acknowledged as well. There is a combination of technological tools and internet infrastructure that have a great potential for their application in education. (Grigol et al., 2014) Planning and designing a VLS may be challenging because different technological tools may foster different impacts. Therefore, implementing any sort of digital technology, without the support of a pedagogical purpose, entails the danger of ignoring the most effective solutions that may enrich education. Some examples of emerging technologies that may enhance VLS are Internet of Things (IoT) and big data, which have the potential of institutionalizing continuous learning and sharing protocol. (Di Vaio et al, 2021) Other technologies that may potentially add value to the learning process are virtual and augmented reality devices

(Elmqaddem, 2018) digital platforms, AI, computers, mobile phones, tablet, projectors, eReader, touch screens, 3D printers and digital whiteboards.

## 2.5 Learning atmosphere & competencies

The learning atmosphere influences the effectiveness of VLS and it should be motivating, creative and innovative. Other intangible elements influencing the learning process are the competencies, namely soft and hard skills developed by the stakeholders. For instance, facilitators should be creative and committed in the assumed didactics, but also responsible and rigorous. Learners and facilitators should develop digital competence, dynamicity, flexibility, resilience as well as critical and lateral thinking (Silva et al, 2019; Connor & Davidson, 2003).

For each of the dimensions of the conceptual framework, in the following figure are synthetized the relevant variables to consider for the assessment of VLS. (Fig.1)

Tab. 1 – Conceptual framework to assess and manage a VLS

## 3 Case study analysis and findings

A case study (Yin, 2013) has been developed to test the framework in a real setting, which allowed enriching the theoretical insights with practical findings. The case study method can be successfully to probe beneath the surface of a situation and to produce a rich context for understanding. In fact, it contributes

enriching empirical base especially when quantitative or statistical data are difficult to extract (Robinson and Shumar, 2014).

### **3.1 Research Context**

The case study is focused on the project *One Class!* The project is developed by Openet Technologies, an innovative organization situated in Matera, in cooperation with "Agenzia Spaziale Italiana" (ASI) and European Spatial Agency (ESA). Openet technologies is an innovative organization that offers satellite-based solutions, operating in the ICT sector in the field of *Edutainment*.

*One class!* is a project aimed at solving a problem faced by some schools in Basilicata (Italy) and other small towns in Italy. In particular, when schools are located in isolated areas, they may face the problem of multi-classes. *One Class!* was developed as an affordable and effective solution to the isolation of the multi-classes and the Digital Divide. Several reasons motivate the choice of *One Class!* as a convenient case to analyze. The project, indeed, involved 56 classes and was aimed at transforming the isolation of territory from a limit to an opportunity to innovate. The analyzed VLS are innovative and formal learning spaces connected between them through tools for videoconferencing. In fact, Openet technologies provided advanced technologies and satellite-based solutions to enrich the learning spaces of schools situated in isolated areas. In this vein, multi –classes, through a distance learning approach, were daily connected with the correspondent level of a standard class in another school. This was an opportunity for the students living in small countries, to attend lectures in standard classes, whilst it was also the chance, for the standard classes, to obtain advanced technologies to integrate into their learning spaces.

### **3.2 Data collection and analysis**

The first step was an audit of all the resources characterizing the VLS, technological as well as organizational (i.e. technological tools, furniture, decorations etc.). Then, the data collection process was carried out with four approaches, namely: i) document analysis (i.e. analysis of documents and Openet website); (Bowen, 2009); ii) participant observation; (Longhurst, 2003); iii) semi-structured interviews with teachers, headmasters and Openet; iv) Surveys with schools' students. The approaches are presented in the following table (Tab.2).

Tab. 2 – Data collection process

<b>Data collection process</b>	<b>Timing</b>	<b>People involved</b>	<b>Performances analyzed</b>
I) Document analysis	1/05/2019 – 30/06/2019	<ul style="list-style-type: none"> <li>• Authors</li> </ul>	<ul style="list-style-type: none"> <li>• Functioning of the technological infrastructure</li> <li>• Suitability of the pedagogical approaches supporting the integration of technologies</li> </ul>
II) Participant observation	3/06/2019 - 14/06/2019	<ul style="list-style-type: none"> <li>• Authors</li> </ul>	<ul style="list-style-type: none"> <li>• Level of flexibility and creativity of the spaces</li> <li>• Suitability of the pedagogical approaches supporting the integration of technologies</li> <li>• Level of cooperation</li> <li>• Relationships between peers/ between learners and facilitators</li> </ul>
III) In- depth interviews	3/06/2019 - 14/06/2019	<ul style="list-style-type: none"> <li>• Authors</li> <li>• Openet technologies</li> <li>• 2 headmasters (primary school)</li> <li>• 6 teachers (primary school)</li> </ul>	<ul style="list-style-type: none"> <li>• Functioning of the technological infrastructure</li> <li>• Suitability of the pedagogical approaches supporting the integration of technologies</li> <li>• Level of satisfaction, motivation and resilience</li> <li>• Level of innovativeness</li> <li>• Level of cooperation</li> <li>• Relationships between peers/ between learners and facilitators</li> <li>• External relationships</li> </ul>
IV) Surveys	3/06/2019 - 14/06/2019	<ul style="list-style-type: none"> <li>• Authors</li> <li>• 44 students of the 4<sup>th</sup> and 5<sup>th</sup> grade from the primary schools</li> </ul>	<ul style="list-style-type: none"> <li>• Level of satisfaction, creativity, resilience</li> <li>• Level of innovativeness</li> <li>• Level of cooperation</li> <li>• Relationships between peers/ between learners and facilitators</li> </ul>

Validity was secured by the adoption of multiple methods (i.e. document analysis, participant observation, in-depth interviews and surveys) to analyze the case and collect data. Reliability can be demonstrated by the storage of all the data collected and recorded during the programs' activities.

### 3. 3 Research findings

According to the purpose of this study, the last step presented is the analysis of the data collected. The data derived from the audit of the resources and the conceptual framework have been merged. The framework has been adopted as an interpretative model that allowed the identification of the main dimensions of the analyzed VLS. It has been applied to the case study through document analysis, participant observation and in-depth interviews, as showed in table 2.

The findings are discussed below.

About the *Physical dimension*, the level of flexibility and creativity was high thanks to moveable chairs, work tables and colourful walls included within the space.

About the *technological dimension*, each class participating in the project was provided with an advanced laptop computer, an interactive digital whiteboard, access to the satellite network, the OAT monitoring system and an e-learning platform (*Spontania*). 100% of interviewed teachers and headmasters were satisfied with the tools provided, used also beyond the scope of the project. The technological infrastructure was well functioning and advanced for 50% of the respondents (3/6), however, 100% of them (6/6) was particularly satisfied of the technical assistance and the training provided by Openet engineers. Moreover, half of the respondents (50%) claimed that the software *Spontania* was easy to use. Despite this, some issues arose with the satellite signals, not always stable for 50% of the interviewed. Generally, the most important problem concerned the integration of digital technologies into classrooms' daily routines. In fact, only 50% of teachers (3/6) implemented suitable pedagogical approaches and learning methodologies.

The data collected have also confirmed that the *relational dimension* is a key factor in enhancing the effectiveness of a VLS. The level of cooperation detected was high. Students were continuously interacting, to achieve specific learning and pedagogical objective. This finding was confirmed by 75% of teachers and headmasters and 100% of students. Moreover, 50% of teachers acted as facilitators (3/6), motivating and driving students in their learning processes. The external relationships were developed between standard classes and multi classes, situated in different towns, as well as between different schools participating to the project.

Lastly, the *learning atmosphere & competencies* was positive. In fact, the satisfaction level was high, 91% of students were motivated, enthusiastic and involved in the lessons. However, 33% of teachers claimed that sensitive students should acquire a higher level of self- confidence to be active and interested during the distance learning activities. Generally, not all the teachers showed positive attitudes towards the VLS (only 50% of them), and thus they need further stimulations. This aspect reduced the level of innovativeness perceived within the schools participating to the project. The negative attitude of some teachers arose by the fact that many of them (50%) did not have the basic technical and digital skills needed to interact with innovative tools. On the other hand, students were considered digital native, and, therefore, innate digital skills favored them in the interaction with technological tools.

#### **4 Conclusions and discussion**

This research has focused on the development of a conceptual framework that identifies the relevant dimensions to consider for a systematic and holistic assessment of VLS performance.

First, a literature review to define role and relevance of a learning space was carried out. Then the conceptual framework was developed, drawing from the literature on VLS.

The literature review has provided a consistent theoretical background for the development of the conceptual framework, identifying the relevant dimensions that enhance the dynamics within the VLS.

The framework was thus tested on a case study regarding a VLS implemented in schools, to overcome the isolation of students living in rural areas. Each of the frameworks' dimensions has been evaluated with the analysis of interviews and surveys with the stakeholders as well as the document analysis and the participant observation.

The derived practical findings enriched the theoretical insights, confirming the usefulness of applying the framework to effectively manage a VLS. In fact, it highlighted the relevance of the assessment for managing these spaces. Through the identification of the key dimensions, the framework pointed out weaknesses to overcome and strengths to monitor, to develop effective VLS.

For instance, it detected a low attitude of some teachers towards the VLS and the lack of basic technical skills that may hamper the innovation dynamics.

Moreover, the framework measured a high level of motivation and cooperation inside and outside the boundaries of the schools, strengths that need to be monitored and maintained.

From a theoretical viewpoint, the paper contributes to the further development of the literature about LS and VLS, providing a definition suitable to different levels of application. Moreover, given the growing attention on VLS, the study identifies specific variables and dimensions to consider in assessing learning spaces supported by digital technologies.

Concerning the practical implications, the paper provides managers with a conceptual framework and some insights for the assessment of the performances of VLS that may allow them to make informed decisions and management plans based on key data and knowledge.

However, the study presents some limitations. The main limitation regards the analysis of a single case study that may hinder the generalizability of the results. Moreover, the conceptual framework should be tested in other fields of application, such as the higher education sector as well as in organizations and territories. In conclusion, considering future research avenues, the research highlights the importance of developing measurable key performance indicators to integrate within the conceptual framework to assess VLS performance effectively.

### **Abstract**

Although the relevance of knowledge assets dimensions influencing EE is widely recognized, a holistic knowledge-based perspective about EE is missed. The paper provides a literature review on EE through knowledge management lenses. Drawing on the results of the literature review, the paper proposes a framework describing knowledge assets categories founding an EE program, i.e. "*Knoware Tree for EE programs*". The study, through the proposal of the conceptual framework "*Knoware Tree for EE programs*", identifies the knowledge assets dimensions grounding EE programs. The assets are grouped into two main pillars: i) structural knoware and ii) stakeholder knoware.

The framework "*Knoware Tree for EE programs*" allows to identify, analyse, manage and assess knowledge assets grounding an EE program. It represents, indeed, a useful tool that practitioners can adopt to disentangle knowledge roots of EE programs and to effectively design, manage improve and assess them. From a theoretical point of view, this paper contributes to further develop the literature on EE by providing an analysis of EE programs through knowledge management lenses. Moreover, the research extends the applicability of the conceptual framework "*Knoware Tree*", by testing and implementing it in the setting of EE programs.

**Paper type** – Academic Research Paper

## 1 Introduction

In the current VUCA context (Bennett and Lemoine, 2014) the importance of developing an entrepreneurial mindset allowing the identification of opportunities and challenges and their consequent transformation into innovative solutions suitable to face the sudden changes and the unpredictability of the competitive context, becomes even more relevant (O'Connor, 2013; Solomon, 2007). The processes of transformation of challenges, barriers and obstacles into new entrepreneurial opportunities, which fall within the broader concept of entrepreneurship, therefore, nowadays, are increasingly capturing the interest of both academics and practitioners (Fyen et al., 2019; Secundo et al., 2020). This attention is furthermore motivated by the COVID-19 pandemic and the consequent socio-economic crisis, the need for developing skills and attitudes prone to problem solving and to be able to make decisions in risky and unpredictable contexts, generating creative and innovative solutions and enabling dynamics of transformation and innovation of business models is increasingly felt (Santarsiero et al., 2021; Secundo et al., 2020).

To enable the development of entrepreneurial skills, educational institutions, and universities in particular, are activating Entrepreneurship Education (EE) programs, often supported by government bodies. Within this scenario, entrepreneurship is assuming a considerable and growing relevance in higher education systems where there is an expansion of curricular and extracurricular

programs, aimed at promoting entrepreneurial mindsets (Hahn et al., 2017). EE programs are in fact defined by several authors as one of the most promising activity in terms of development of entrepreneurial skills (Raposo and do Paço, 2011; Sousa et al., 2019; Florin et al., 2007). In this vein, several authors have paid attention to assess the relevance of these programs (Liu et al., 2021; Hahn et al., 2020; Karimi et al., 2016; Athayde, 2009; Costa et al., 2018; Morris et al., 2013; Peterman and Kennedy, 2003; Sanchez, 2013; Wilson et al., 2007).

At the basis of EE approaches, however, is that entrepreneurial skills and attitudes are not an innate gift. On the contrary, they are learned with time (Volery et al., 2013). Becoming a recognized entrepreneur, thus, is the result of learning processes influenced by tangible and intangible knowledge assets (Dickson, Solomon, and Weaver 2008; Klandt 2004; Kolvereid 1996). EE, therefore, develops in the learning process through the application of the knowledge spiral and the presence of learning situations like, for instance, best practice benchmarking, the stimulation of creative and innovative thinking, and guaranteeing a direct connection between learning and real environment (Nonaka, 2007; Frolova et al., 2021). Similarly, other authors have focused their efforts on the search for sets of distinctive dimensions, namely knowledge assets, that characterize successful EE programs to identify best practices and provide guidelines to facilitate the emulation and dissemination of effective EE programs (Dulcembre, 2019; Apostolopoulos et al., 2018; Secundo et al., 2020; Fretschner and Weber, 2013; Al-Atabi and DeBoer, 2014; Sousa et al., 2019; Secundo et al., 2021). Consequently, it follows that the development of effective EE programs directly depends also on a set of knowledge assets that require effective management procedures (Raposo and Do Paço, 2011; Sousa et al., 2019).

Generally, the role of knowledge management has a great relevance for supporting organizational performance improvement and business and entrepreneurship dynamics (see e.g. Heisig, 2016; Millar, 2016; Byukusenge, 2017; Schiuma, 2012; Schiuma et al., 2008b; Nonaka, 2007). Moreover, EE is characterized by high knowledge intensity, in fact, several studies and researches investigate the role and potential of knowledge management in educational organizations (Rodríguez-Gómez and Gairín, 2015) and mostly in higher education systems (Rowley, 2000; Alexandropoulou et al., 2009; Veer-Ramjeawon and Rowley 2020).

In this respect, several attempts to provide frameworks for mapping knowledge dimensions and assessing the effectiveness of knowledge management in

organisational context have been registered (see e.g. Nonaka and Tacheuchi 1995; Driessen et al., 2007). The SECI spiral model, for instance, is one of the most acknowledged contributions in the field. The same attention in identifying and assessing the critical knowledge assets dimensions distinguishing EE programs has still not been paid. Therefore, a structured and rigorous approach that identifies and assesses knowledge asset dimensions and tools holistically is lacking. According to Fayolle and Gailly (2008), Maritz and Brown (2013) and Liu et al (2021) the need for a framework based on EE's knowledge assets providing management recommendations on how to design, manage, assess and educate through EE programs is felt.

Accordingly, this paper aims to contribute to this research stream by investigating and identifying the compelling knowledge assets dimensions distinguishing a EE program, to manage for effective business and entrepreneurship education. The paper attempts to provide an answer to the following research question (RQ): what are the compelling knowledge asset dimensions to consider to design and manage effective EE programs? To answer this RQ, the research tests and extends an established conceptual framework, the Knoware Tree (Schiuma et al., 2008), by applying it to a new, theoretically applicable setting in the BEE sector. The conceptual framework was originally developed to identify and assess knowledge dimensions affecting innovation and development dynamics in regional and territorial contexts, as well as in change management programs within organizations (Schiuma et al., 2008a; Schiuma et al., 2008b). Therefore, considering its peculiarity and potential adaptability to the EE context, the framework has been readapted to the EE context.

The study sheds more light on how to design and manage an EE program by leveraging several knowledge assets related to human, relational, tangible, and intangible factors affecting the learning experience.

The research aims to provide theoretical and practical contributions. From a theoretical point of view, this paper contributes to further develop the literature on EE by providing an analysis of EE programs through knowledge management lenses. Moreover, the research extends the applicability of the conceptual framework Knoware (Schiuma and Lerro, 2010; Schiuma et al., 2008a; Schiuma et al., 2008b), testing and implementing it in a new setting, the EE programs. On the other hand, the conceptual framework represents a useful tool that practitioners can adopt to disentangle knowledge roots of EE programs and to effectively design, manage improve and assess them.

The paper is organized as follows. In the next section, an analysis of the role and relevance of the EE is discussed. Then, drawing on the Knoware Tree (Schiuma et al., 2008), and triangulating the framework's theoretical assumptions with evidence gathered from a review of literature on EE, the compelling EE's knowledge assets categories are pointed out and described. Lastly, theoretical and practical implications, as well as future research directions are illustrated.

## **2 Role and relevance of the EE**

The critical role of entrepreneurs and businesses is widely and traditionally acknowledged as relevant for the development and well-being of societies (Sousa et al., 2019). They stimulate a wave of positive impacts on different fields such as higher employment and increasing productivity and play an important role in economic, social development, and sustainable growth. (Maritz and Brown, 2013) In particular, entrepreneurship is considered as one of the most important economic forces as well as a dynamic process of vision, change and creation (Raposo and do Paço, 2011). Data from the Global Entrepreneurship Monitor (GEM) 2019-2020 confirm the importance of entrepreneurship as an engine for change in economic and social fields and introduce the innovative dimension in the entrepreneurial dynamics. Moreover, entrepreneurship is raising even more interest among students. In fact, according to the results of the GUESSS report (Sieger et al., 2018) based on surveys distributed to 208000 students from 3000 universities in 54 countries, 9% of students intend to be an entrepreneur directly after studies, whilst 34.7 % of them plan to be entrepreneurs 5 years after completion of studies. (Sieger et al., 2018)

Accordingly, education about entrepreneurship recently emerges as a relevant enhancing factor aimed at fostering entrepreneurship and developing entrepreneurial culture (Sousa et al., 2019; Raposo & Do Paço, 2011; Rideout and Gray, 2013). Entrepreneurship education (EE) is thus considered one of the most important components of entrepreneurship development because it stimulates progress and innovation (Vakili, 2016). EE is a newer area of focus in business education and includes courses, programs and co-curricular/ extracurricular activities that teach entrepreneurial management, strategy, innovation, and venture development as well as entrepreneurial traits, attitudes and skills. (Rideout and Gray, 2013; Sarooghi et al., 2019) According to Kirby (2003, as cited in Kirby, 2007 pp. 21) EE aims to *"develop graduates who can be innovative and*

*take responsibility of their own destinies not just in a business or even a market economy context*". In such a prospect, the role of EE is to teach students how to become an entrepreneurial person, entrepreneur's role in the economy and society, and attributes and behavior of business people (Kirby, 2007). EE should enhance people's capacity to observe, describe and analyze, people's ability to see opportunities, cope with uncertainty and ambiguity, anticipate changes in the real business and entrepreneurship scenario, and, most of all, the ability to innovate. Recent researches reveal that a good and valuable entrepreneurial person needs to acquire contents concerning functional management but also values and soft skills useful to develop a sustainable competitive advantage within the entrepreneurial ecosystem surrounding him/her (Raposo & do Paço, 2011; Vakili et al., 2016). This aspect is highly significant because entrepreneurship programs involve cognitive approaches and emotional processes aimed at influencing and empowering learners' values, attitudes, behavior, knowledge, and skills (Fretschner and Weber, 2013).

The actuality of the topic is fueling the debate whether and under which conditions EE contributes to students' entrepreneurial learning because entrepreneurial skills are particularly hard to acquire and teach, as well as students have to be an active part in the learning process to foster the process of skills development (Hahn et al., 2017; Nabi et al., 2017; Wright et al., 2017; Hahn et al., 2020). In this regard, and according to Fyen et al. (2019) and Sieger et al. (2018) universities play a key role in influencing entrepreneurial intentions and activities and, therefore, are becoming environments where students might be supported in developing their entrepreneurial mindset. In this perspective, universities are becoming increasingly aware of the important role they must play in teaching students how to generate value in organizations, economy and society, and therefore contribute to the entrepreneurial ecosystem development. In higher education, in fact, the amount of EE programs is increasing in the last years (Wilson, 2008; Fretschner and Weber, 2013). In particular, in Italy, the Italian Ministry of Education, University and Research (MIUR) supported the development of a national network of entrepreneurship laboratories delivering EE programs: Contamination Labs (CLabs). CLabs are laboratories located in more than twenty universities around Italy, organized in a blended form, aimed at boosting students' entrepreneurial and innovative culture. The programs involve students with multidisciplinary backgrounds and different educational levels, providing new learning models aimed at developing innovative and

entrepreneurial projects, rooted in a specific territorial context. CLabs fully support and enhance the interdisciplinary cooperation required by entrepreneurial disciplines. (Fyen et al. 2019; Secundo et al., 2020).

Initially, the main focus of EE programs was the creation of new ventures and startups, whilst more recently the main objective is a wider concept which emphasizes entrepreneurship as a way of thinking and behaving (Hahn et al., 2017). Therefore, to shape a successful entrepreneurial person, universities and whoever designs a program has to systematically identify, manage and exploit the spectrum of resources, assets, and competencies grounding entrepreneurship education programs (Sousa et al., 2019).

### **3 EE: a knowledge-based perspective**

Despite the growing importance of EE in the current competitive landscape, the effectiveness of these programs is highly dependent from the result of learning processes influenced by tangible and intangible knowledge assets (Dickson, Solomon, and Weaver 2008; Klandt 2004; Kolvereid 1996).

EE is, therefore, characterized by high knowledge intensity, as well as all the educational activities. Focusing on the educational field, some studies and researches investigate the role and potential of knowledge management in educational organizations (Rodríguez-Gómez and Gairín, 2015) and mostly in higher education systems. (Rowley, 2000; Alexandropoulou et al., 2009; Veer-Ramjeawon and Rowley 2020). In fact, according to Alexandropoulou, et al (2009), Veer-Ramjeawon and Rowley (2020) universities' missions are linked to knowledge management activities that are creation, transformation and sharing of knowledge.

Entrepreneurship, in particular, is further linked to knowledge dynamics. In fact, it is developed in the learning process through the application of the knowledge spiral and the presence of learning situations like, for instance, best practice benchmarking, the stimulation of creative and innovative thinking, the conversion between tacit and explicit knowledge and guaranteeing a direct connection between learning and real environment (Nonaka, 2007; Frolova et al., 2021).

Therefore, developing an effective EE program directly depends also on a set of knowledge assets that require effective management procedures (Raposo and Do Paço, 2011; Sousa et al., 2019).

In this perspective, the identification and the management of the strategic knowledge-based resources grounding EE programs emerge as relevant research streams to be addressed to successfully design and manage such programs, and, to foster successful and effective learning actions (Schiuma et al., 2008; Schiuma & Lerro, 2010).

Thus, the paper's aim is to identify the compelling knowledge assets dimensions to consider to design and manage effective EE program.

Several researchers identified sets of distinctive dimensions and characteristics of a EE program that may be classified as knowledge assets. (Othman, 2019; Sousa et al., 2019; Volery et al., 2013; Raposo and Do Paço, 2011; Kirby, 2007). Although knowledge assets have been fundamentally considered as intangible, it is essential to recognize that some of them stand as tangible resources incorporating knowledge. These assets have strategic importance because they can create and deliver value and, at the same time, can support knowledge development. (Schiuma, et al., 2008)

In the field of EE, some insights about tangible and intangible knowledge assets for EE are provided by Dulcenombre (2019) and Apostolopoulos et al. (2018) that focused their studies on the importance of structural tangible dimensions, namely the attitude of learning environments to favor the development of business and entrepreneurial skills and attitudes. On the other hand, Al-Atabi and DeBoer (2014), Sousa et al. (2019) and Secundo et al. (2021) analysed structural tangible as well as intangible dimensions, assessing the effectiveness of EE courses delivered towards online tools, like Distance Learning Platforms or Massive Open Online Course (MOOC), identifying useful tools, technology, processes and practices to follow. Moreover, Secundo et al., (2020) and Fiore et al. (2019) emphasized the role of networking and relationships for entrepreneurship programs. Lastly, other studies highlighted the relevance of the role of human capital and soft skills (i.e. personal and behavioral beliefs and attitudes) for the EE programs. (see e.g. Othman, 2019; Fretschner and Weber, 2013; Raposo and Do Paço, 2011; Kirby, 2007).

Despite the literature on EE underlines the importance of tangible and intangible knowledge dimensions in EE programs, there are no structured and rigorous approaches that allows to identify, assess and manage comprehensively the knowledge components, tangible and intangible, characterizing a EE program.

Accordingly, some entrepreneurship education scholars, such as Fayolle and Gailly (2008), Maritz and Brown (2013) and Liu et al. (2021), claimed the lack of a

common framework or agreed good practices regarding how to teach, educate and assess EE.

Generally, several attempts to provide framework for mapping knowledge dimensions and assessing the effectiveness of knowledge management in organisational context have been carried out (e.g. Nonaka and Tacheuchi, 1995; Driessen et al., 2007; Schiuma et al., 2008). Schiuma et al. (2008), proposed the Knoware Tree as an interpretative framework analysing the knowledge-based dimensions of regional development dynamics, through the discussion of the positive and significant role of the identified knowledge assets dimensions that play a fundamental role in activating and sustaining development dynamics. This framework was originally thought as an interpretative and normative model useful to enhance the innovation dynamics taking place at regional, territorial and organizational level. The framework provides useful insights and guidelines to disentangle and analyse the plethora of knowledge assets founding the functioning of an organizational system, be it region or a private or public organization. More generally the Knoware Tree proved to be a useful interpretative model to disclose the knowledge roots of any system, be it organizational or functional to organizational development.

In the light of the Knoware Tree's potential, the research has adopted the model and applied it to disclose the knowledge asset dimensions founding EE programs.

In this vein, the architecture of the original framework has been modified drawing from the literature on EE. The knowledge assets dimensions of the Knoware Tree and its sub categories have been tailored to the investigated setting, i.e. EE program context.

The resulting framework, called "*Knoware Tree for the EE programs*" identifies and describes strongly interrelated knowledge assets shaping an EE program. Moreover, it analyzes and assesses the potential derived by their interactions, considering them in a systematic and holistic perspective (Maritz, 2017; Maritz & Brown, 2013).

Specifically, the framework is composed of two main pillars: the *structural knoware* and the *stakeholder knoware*. The identified pillars and related sub-dimensions are discussed below in details.

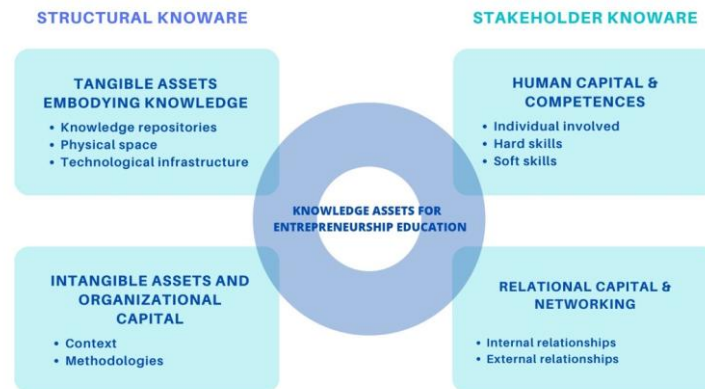

Fig. 1 – The Knoware Tree for the EE programs  
Source: adapted from Schiuma et al. (2008)

### 3.1 Structural Knoware

The first pillar characterizing the revised “*Knoware Tree for the EE programs*”, includes tangible and intangible assets that are relevant for the development, acquisition, management, and diffusion of knowledge in education and training. In particular, the knowledge asset dimensions are *the tangible assets embodying knowledge* and *the intangible assets and organizational capital*.

#### 3.1.1 Tangible assets embodying knowledge

The dimension *Tangible assets embodying knowledge* includes all the tangible organizational and structural assets grouping know-how important for knowledge management, transfer, or application (Schiuma & Lerro, 2009).

In particular, for the EE perspective, this dimension includes three different sub categories: knowledge repositories, physical learning spaces, and technological infrastructures. The *knowledge repositories* are physical infrastructures representing a precondition to the transfer of tangible and intangible knowledge assets in the specific contexts where they rise (e.g. incubators, co-working spaces). (Sarooghi et al., 2019; Kirby, 2007). The *physical learning spaces* are the classrooms or any space where the students participate to EE programs. According to Dulcenombre (2019), tangible resources and facilities may provide a significant influence on different aspects of the learners, such as cognitive beliefs, satisfaction and outcomes. The physical aspect is the layout of the classroom, the

spaces and the arrangements, study spaces, lighting and furniture. The setting of innovative spaces should be different from the one of a standard classroom because versatility and flexibility facilitate activities enhancing knowledge transfer activities. (Sarooghi et al., 2019)

Lastly, the *technological infrastructure* represents the technical assets and tools supporting knowledge transfer, creation, development processes and include ICT, digital communication systems, emerging technologies and networks (Schiuma & Lerro, 2009). IT infrastructure has to be stable, functional, and advanced. Empirically, different innovative technologies could be integrated into entrepreneurship programs. Some example are software components, e.g. digital platforms (EdModo, GSuite and others), IOT systems and sensors, artificial intelligence, chatbots, ERP platforms; and hardware components e.g. computers, mobile phones, tablet, projectors, electronic books, touch screens, 3D printers, digital whiteboard, tools of virtual and augmented reality, drones, and wearable devices can play a significant role.

### 3.1.2 Intangible assets and organizational capital

The *Intangible assets and organizational capital* dimension includes all the structural and organizational assets having a soft value. Some examples are routines, procedures, processes, task designing, organizational culture, value and leadership, corporate management philosophies (Schiuma et al., 2008). In the field of EE, these assets are reflected in the notions of *context and methodologies*. The *context* includes the learning atmosphere and the knowledge dynamics of the EE program (Nonaka and Takeuchi, 1995; Kickul and Fayolle, 2007; Maritz and Brown, 2013). According to Kirby (2007), a diffused and well-constructed entrepreneurial culture is a key intangible prerequisite for empowering learners and facilitating entrepreneurship learning processes. Moreover, there are several examples of innovative methodologies that may enhance EE programs or, in general, can improve teaching and learning of business subjects: project based-learning, problem based-learning, digital stories and storytelling, collaborative communities, augmented reality, gamification and simulation (Sousa et al. 2019; Sousa and Rocha, 2019; Sarooghi et al., 2019; Lee et al., 2017; Fiertler, 2020). These notations are not exhaustive of all EE literature, but provide a general overview of the main methodologies.

### **3.2 Stakeholder Knoware**

The second pillar of the “*Knoware Tree for the EE programs*”, refers to the human capital, in the form of actors involved in the educational and training activities, namely teachers, students, mentors, trainers, external stakeholders and related competencies and relationships. It is characterized by two knowledge asset dimensions, namely *the human capital and competencies* and *the relational capital and networking*.

#### **3.2.1 Human capital and competencies**

The *Human capital and competencies* dimension refers to all the knowledge influencing human behavior, namely the know-how, abilities, and competencies. The concept of human capital pertains to the individual’s knowledge and abilities that allow for changes in action and economic growth (Coleman, 1988). According to a EE perspective, the human capital contributes to the improvement of the overall learning experience and the achievement of learning outcomes. The dimension can be analyzed considering both the engaged individuals and the hard and soft skills to develop. The *individuals involved* in a EE program are the audience and staff. The audience of the EE programs can be composed of students aimed at becoming future entrepreneurs, belonging to heterogeneous group of people. Students may have, indeed, different learning needs and belong to different categories, according to a classification based on socio-demographics, stage of the, type of degree and other features. Understanding the composition of an audience participating in EE programs means addressing the different needs and engage all the stakeholders in the process (Maritz & Brown, 2013). Moreover, EE programs need to address effectively the need for the development of the hard and soft skills of the participants. In this vein, it is important to identify and analyses them appropriately. The *hard skills* are linked to the learning outputs in terms of managerial, economics skills, use of business tools, operational procedures, and knowledge of the startup process. (Fetschner and Weber, 2013). On the other hand, a future entrepreneur should develop different soft skills, such as motivation, self-regulation, self-awareness, self-efficacy, and social skills. Moreover, learners also need to develop personal connections with peers and trainers, to co-construct knowledge. (Liu et al., 2021; Othman 2019; Raposo and Do Paço, 2011; Kickul & Fayolle, 2007).

### 3.2.2 Relational capital and networking

The *Relational capital and networking* dimension refers to the knowledge assets linked to internal and external, formal and informal relationships among all the stakeholders involved in the organizational and business dynamics both at a micro-level and macro-level (Schiuma & Lerro, 2009; Schiuma et al., 2010). In the EE field, cognitive relationships may stimulate knowledge transfer and share from tacit to tacit, tacit to explicit, and explicit to explicit, to promote interest and involvement of the participants. *Internal relationships* should be developed to support the students, by considering their mindset and their well-being. Generally, in universities, students may benefit of a multidisciplinary environment that, according to Fyen et al. (2019) and Secundo et al. (2020), is the right environment for the development of entrepreneurial culture. In fact, this specific environment allows individuals with different backgrounds to work together for the development of advanced entrepreneurial knowledge and innovative solutions to problems and challenges. However, internal relationships are not sufficient, an environment that is supportive and helpful for the development of the entrepreneurship activity and, in consequence, for the education of future entrepreneurs, may be a stimulus for the overall process because entrepreneurs interact continuously with the external environment. The *external relationships* include partnerships among schools, universities, research institutions, business incubators and accelerators, co-working spaces and companies involved in EE courses. The perspective can be widened, by considering policies, regulations, government, and business environment also at a national level (Sousa et al., 2019; Sarooghi et al., 2019).

## 4 Conclusion and implications for future research

There is increasing debate regarding the conditions according to which entrepreneurship education (EE) contributes to students' entrepreneurial learning considering the difficulties in developing and teach entrepreneurial skills. According to Fyen et al. (2019) and Sieger et al. (2018), universities play a key role in influencing entrepreneurial intentions and activities. They are, thus, becoming environments where students might be supported in developing their entrepreneurial mindset.

Generally, EE is characterized by high knowledge intensity, as all the educational activities. (Rowley, 2000; Alexandropoulou et al., 2009; Veer-

Ramjeawon and Rowley 2020). Moreover, entrepreneurship develops in the learning process through the application of the knowledge spiral and the presence of learning situations (Nonaka, 2007; Frolova et al., 2021). Therefore, developing an effective EE program directly depends also on a set of knowledge assets that require effective management procedures. (Raposo and Do Paço, 2011; Sousa et al., 2019).

In this perspective, the identification and the management of the strategic knowledge-based resources grounding EE programs emerge as relevant research streams to be addressed to successfully design and implement such programs.

Thus, the paper provides an answer to the following Research Question (RQ): what are the compelling knowledge assets dimensions to consider to design and manage effective EE programs?

This paper contributes to identify and analyze the knowledge dimensions grounding effective EE programs in a holistic perspective. From a knowledge-based perspective, EE programs can be re-seen and interpreted according to the availability and use of specific sets of knowledge assets managed by effective knowledge management initiatives. In this vein, the research discusses the opportunity to readapt the Knoware Tree to the EE (Schiuma et al., 2008). To answer the above described RQ, the established conceptual framework has been extended and readapted, by applying it in the EE sector. The resulting *"Knoware Tree for the EE programs"* identifies and describes strongly interrelated knowledge assets dimensions to leverage for the design and management of a successful EE program.

About the future avenues of the research, the proposed framework, i.e. *"Knoware tree for the EE programs"* may be the foundation for the development of a set of indicators assessing the effectiveness of EE programs, considering the compelling knowledge asset dimensions identified.

The research provides theoretical and practical contributions. About theoretical implications, the paper provides a conceptual framework that offers a holistic and systematic knowledge-based perspective to drive the designer of EE programs to develop more effective and impactful plans, and to support the ex-ante, in-itinere or ex-post assessment of EE programs.

Moreover, the research extends the applicability of the "Knoware Tree" model, by testing and implementing it in a new setting, the EE programs.

Regarding managerial and practical implications, the proposed model can be useful to different actors as, for example, lectures, universities, educational

institutions, consultants, companies, and public administration offices, to identify and analyze new conceivable learning patterns, approaches, and tools capable to stimulate mindsets and capabilities of the entrepreneurship among students and support virtuous cycles of learning and innovation in entrepreneurship education.

### Abstract

In today's digital age, companies are challenged to invest in digital innovation and adapt their business models to the challenges of the digital world. In recent years, various studies have addressed the question of how organisations can foster digital innovation attitudes and skills to respond to the new challenges and embrace digital transformation. Organisations are taking and implementing various initiatives to deal with the challenges of digital transformation. These initiatives range from adopting, developing, and integrating new digital technology solutions to create new business processes and customer experiences or modify existing ones, to creating an innovative organisational culture and mindset to meet changing value paths and ways of working.

An analysis of the current theoretical and practical literature on digital transformation shows that this important process is associated with an increase in several dimensions of organisational performance, including innovativeness, financial performance, firm growth, and reputation. However, as reported in a recent Forbes survey (2020), these positive outcomes are not assured. The failure rate of all digital transformation initiatives is 70%. This failure is not surprising since, as Gartner (2017) and Forbes (2020) pointed out in their

recent surveys, nearly half of CEOs do not have metrics for digital business transformation and lack systems of record for the work and impact of digital initiatives.

Indeed, one of the reasons for the failure of the digital initiatives is the lack of a performance measurement capable of tracking and adequately managing the progress in the digital transformation of an organisation.

In this vein, based on an abductive approach derived from an extensive literature review on digital transformation, business model innovation and related performance measurement and management models, including those in R&D, this paper proposes a framework for assessing and managing digital transformation initiatives and their impact on organisational performance. The proposed framework provides new insights into both the key challenges in assessing digital transformation processes and their impact on organisational performance, and the role that performance measurement models play in the design and implementation of digital transformation initiatives. In addition, the framework represents a first attempt to shed light on the approaches required to measure and evaluate the impact of digital transformation initiatives on organisational performance.

## 1 Introduction

In today's business landscape companies are challenged to become more and more flexible, intuitive, imaginative, resilient, and creative to face the increasing complexity, turbulence, unpredictability, and pace of change of the competitive environment (Santarsiero et al., 2021). Indeed, organisations have to face unexpected and unclear scenarios dealing with new emergent challenges and business problems that require the development of organisational capacity for creativity and innovation to survive and sustain sustainable growth.

In today's digital age, more than ever promoting innovation processes and, in particular, digital innovation, becomes imperative for managers (Schwartz, 2002). Indeed, markets are becoming even more digital as well as consumers' behaviours, attitudes and needs are affected by digital technologies. As a result, organisations need to adapt their business models to the challenges of the digital world and industry 4.0 revolution (Bharadwaj et al., 2013).

Both private and public organisations are searching for mechanisms, approaches and initiatives that can support the development of digital innovation capacity and digital transformation processes by defining continuous learning, knowledge and technology management approaches for creativity and

innovation, as well as building collaborative and open innovation capabilities also through the engagement of stakeholders and customers according to user-driven innovation approaches (Cheng and Chen, 2013; Vial, 2019).

Recent literature on digital transformation has put great attention on how firms can take advantage of digital opportunities and drive innovation and enterprise-wide change (e.g. Pagani, 2013; Westerman, 2016).

Organizations embarked in digital innovation, have to choose whether to digitally transform their existing businesses and take advantages from these technologies or yield to the disruptions of their organizational processes and traditional business models (Nwankpa and Roumani, 2016).

Whatever the choice, digital innovation entails several challenges.

A number of studies have analysed the significant challenges and issues that have emerged for firms struggling with how to ignite digital transformation within their organization (e.g. Bordeleau et al., 2020; Vial, 2019). Among these challenges emerge the lack of digital organisational capabilities among employees, the lack of an organisational digital innovation culture, the availability of financial resources to invest, as well as the rigidity of the organisational and management models (Gasser and Palfrey, 2007; Solis, 2018).

Overcoming these structural, organisational and cultural barriers is not effortless but is fundamental to successful digital transformation.

A further relevant factor undermining the effectiveness of digital transformation initiatives is the lack of performance measurement able to track progress in digital organisational transformation and to properly manage it (Turrin, 2019).

Gartner's latest CIO survey points out that digital initiatives are the top priority for 2019. Only 4% of organizations have no digital initiative at all (Gartner, 2019). However, as reported in a recent Forbes survey (Forbes, 2020), 70% of all digital transformation initiatives fail. This failure is unsurprising and can also be attributed to the fact that almost half of CEOs have not metrics for digital business transformation and systems of record for work and effects of digital initiatives are absent.

How detecting the impacts of digital progress in an organisation and how digital transformation breaks into organisations performance measurement and management practice remains little known.

Therefore, based on a comprehensive literature review on performance measurement and management model in the field of R&D and Digital

Transformation, the paper proposes a framework to evaluate and manage the performance of organisations Digital Transformation in Industry 4.0.

The proposed framework provides fresh insights both concerning the main challenges of evaluating digital transformation processes and their effects on organisational performance, and the role played by performance measurement models in designing and implementing digital transformation initiatives. Furthermore, the framework represents a first attempts to shed light on required approaches to measure and assess the impact of digital transformation initiatives on organisational performances. Further on-field empirical investigations are recommended to apply the framework in real organisational context and to identify with practitioners and managers the key indicators and metrics required to monitor and evaluate digital transformation initiatives and to address future organisational digital innovation strategies.

The paper is organised as follows. The next section, explores the field of Industry 4.0 and digital transformation, identifying from literature, the digital transformation critical success factors, as well as the main causes of failure. Then, considering organisation's digital transformation dynamics similar to that of R&D, and thus, acting as a soft system, approaches to the performance measurement and management in R&D are discussed. The fourth section proposes the framework and illustrates some relevant indicators and metrics. Finally, insights, implications and future research avenues are discussed.

## **2 Industry 4.0**

If the fourth industrial revolution was initially conceived as a digital revolution in the manufacturing industry, Industry 4.0 is now described as the digital transformation of the entire industrial value chain (Culot et al., 2020). Digital transformation in the context of Industry 4.0 consists of the implementation of specific digital technologies (Indri et al., 2018) and the development of valuable design principles (Hermann et al., 2016).

Industry 4.0 technology trends are modern digital innovations or advanced manufacturing technologies at low or high levels that enable the digital industrial revolution (Kumar et al., 2020). Low-level technologies include smart sensors, industrial robots, smart wearables and machine controls. They can be acquired and implemented in organisations as part of digitization projects. In contrast, the Industrial Internet of Things, cyber-physical Production Systems, digital twins built

on the integration of various digital and operational low-tier technologies such as network infrastructure, sensors, machines and even networked human components are examples of high-tier technology trends (Drath and Horch, 2014). Moreover, the design principles that distinguish Industry 4.0 as a building block of digital transformation are required to enable members of the industrial value chain to reap the benefits offered by the transition to Industry 4.0. Several studies address the issue of identifying and describing Industry 4.0 design principles (Dev et al., 2020; Hermann et al., 2016). The most widely recognised are horizontal integration, vertical integration, real-time capability, and customer orientation.

Industry 4.0 and Digital Transformation as a reconfiguration of corporate vision, strategy, processes, capabilities and culture based on alignment with the challenges of the evolving business context are thus resetting markets and industries in addition to simply digitizing organizations. Organizations in any type of industry face the challenge of developing and implementing digital transformation initiatives and strategies to maintain the pace of change and seek to improve organizational performance with the aim of gaining a sustainable competitive advantage (Santarsiero et al., 2019; 2020). Therefore, identifying the opportunities and challenges of Industry 4.0, as well as the critical success factors and reasons for failure of organizational digital transformation initiatives, have increasingly attracted the attention of researchers and practitioners (Clauss, 2016; Ghobakhloo and Iranmanesh, 2021; Gurbaxani and Dunkle, 2019).

In particular, Gurbaxani and Dunkle (2019) identify six critical success factors of digital transformation initiatives and associated metrics. These are the firm's strategic vision, the alignment of the vision and its investments in digital transformation, the suitability of the culture for innovation, the possession of sufficient intellectual property and know-how, the strength of its digital capabilities, and the use of digital technologies.

A company's strategic vision, which describes its awareness of digital needs and the capabilities required to meet those needs, is an essential prerequisite for successful digital transformation initiatives. Aligning the digital transformation strategy with the goals and strategies of the overall business is therefore fundamental to developing a comprehensive understanding of how technology and digital capabilities can support business goals (Santarsiero et al., 2021). The measurement of this dimension depends on the effectiveness of the strategy

adopted to pursue the vision and the associated capabilities required to lead a digital transformation journey.

The second dimension relates to the culture of innovation, which is an enabler of digital transformation. Indeed, it is widely acknowledged that digital transformation is a process that involves not only technology but also, and above all, changes and transformations in the culture and mindset of the organization (Schiuma et al., 2021). Measuring the culture of innovation in organizations is done by looking at and evaluating the management practices and work climate that are conducive to innovation.

In addition, to ensure the success of digital transformation initiatives, know-how and intellectual property should be considered to implement the strategic vision and to understand and enable the codification of know-how, including through the use of management software to promote the diffusion of practices and routines that impact business performance.

Similarly, digital capabilities to support digital transformation should be considered to capture the know-how already present in the company and assess the lack of skills needed to implement the strategies designed.

The fifth dimension refers to strategic alignment, intended as coherence between digital transformation investments and the strategic vision, while the last dimension aims to identify attitudes towards the use of innovative digital technologies (i.e. Big Data, analytics, cloud, IoT, etc.).

In parallel with the critical success factors of digital transformation initiatives, several scholars addressed the barriers to digital transformation and the main pitfalls that hinder these processes (Furjan et al., 2020; Gurbaxani and Dunkle, 2019). This topic is relevant due to the alarming data that is evident in digital transformation initiatives. Although the estimated investment in digital transformation initiatives averages \$ 1.3 trillion, 70% of these initiatives do not pursue the estimated goals, resulting in a significant waste of resources for organizations (Zobell, 2018).

According to Zobell (2018), there are two main reasons for the above data. First, organizations often lack comprehensive communication between business units regarding the implementation of digital transformation initiatives. Too often, organizations set up digital transformation units that are compartmentalized from the rest of the organization, and the other business units struggle to understand the potential value of implementing technology and digital solutions. However, successful digital transformation initiatives take place in organizations where

there is alignment of strategic vision and goals to be pursued, and where a working climate conducive to change and innovation is fostered, as well as active employee and stakeholder engagement (Turrin, 2019). Second, most organizations lack metrics, indicators, and systems to track digital transformation and innovation activities, including the financial return on investment. Too often, organizations lack an operational system of record that acts as an authoritative source of truth for the organization's labor investments, progress, and outcomes.

With this in mind, and in order to address this gap, the following is an initial attempt to systematize a framework that identifies the critical dimensions to consider, assess, and measure in order to execute successful digital transformation initiatives. In particular, the framework is based on the assumption that digital transformation initiatives can be compared from a performance management perspective to the dynamics of R&D initiatives and thus soft systems, namely situations where performance cannot be measured by collecting data and evidence from physical devices or sensors and the focus is therefore on processes (Lazzarotti et al., 2011). Therefore, an overview of R&D and soft systems performance measurement is provided below.

### **3 R&D and soft system performance measurement**

Measuring the performance and value contribution of R&D has become a fundamental concern of R&D managers and executives in recent decades (Kerssen-van Drongelen and Bilderbeek, 1999). However, it is still recognized that measuring R&D performance is a challenging task because the level of effort is not always easy to observe, success is uncertain and influenced by uncontrollable factors, and it can usually be assessed only after long delays. The definition of the characteristic to be measured - "R&D performance" - is usually loose and highly context-dependent. As a consequence, many studies have been written in recent years in the literature on performance measurement, innovation and R&D management (Hauser, 1998; Kunz, 2010) and also in the contributions of practitioners discussing the topic and suggesting possible approaches. Some remarkable and interesting attempts to define rigorous models for measuring R&D performance have been published recently (Gwynne, 2015; Schwartz et al., 2011). These attempts are based on the performance measurement dynamics of soft systems and therefore aim to ensure the numerical characterization of R&D performance by pursuing objectivity and intersubjectivity. Specifically, objectivity

is the attitude of considering for measurement only information about the system under consideration and not about the environment. Objectivity is thus a condition for the reliability of the information generated by the evaluation process. Intersubjectivity then, aims at ensuring the same interpretation even among different subjects. Therefore, intersubjectivity is a condition for the public interpretability of the information generated by the evaluation process (Lazzarotti et al., 2011).

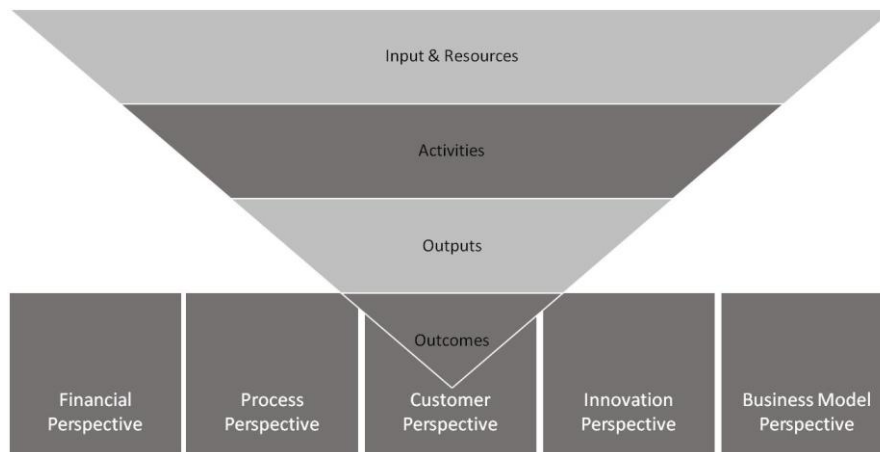

Moreover, R&D initiatives have been considered as soft systems consisting of a set of inputs and activities (basic and applied research, development activities such as technology and knowledge transfer, market analysis), resources (tangible and intangible), as well as outputs (results achieved immediately after the activities have been carried out) and outcomes (medium-term results). These dimensions may be located in a particular R&D unit or alternatively, particularly in the case of SMEs, may be distributed throughout the organization and intertwined with other units, activities and resources.

In order to effectively measure R&D performance, several researchers adapt their proposed models to the accepted balanced scorecard approach (Bremser and Barsky, 2004; García-Valderrama et al., 2008). According to this approach, there are five perspectives to be considered in R&D performance (Kaplan and Norton, 2006; Mari et al., 2009): i) the financial perspective, where performance is defined as maximizing the quantitatively measured return on R&D investments; ii) the customer perspective, where high performance is seen as exceeding or at least meeting customer expectations; iii) the innovation and learning perspective; iv) the internal business perspective; v) the alliance and network perspective.

#### **4 Measuring the performance of organizational digital transformation: a conceptual framework**

Triangulating the insights gained from the research, through an abductive analysis of approaches adopted in performance measurement and management in R&D and soft systems, a framework for measuring and managing organizational digital transformation is proposed and discussed below. The framework thus assumes that digital transformation mimics soft system dynamics, and the measurement system adapts the balanced scorecard approach to the digital transformation context. However, the analysis of the conducted review and the perspectives in the balanced scorecard suggests to provide an extensions of

dimensions to consider appropriate for organizational digital transformation performance. Figure 1 illustrates the emerged dimensions that are discussed below.

*Figure 1 – Framework for measuring organisational digital transformation*

The framework focuses, at the same time, both on inputs & resources, activities, and output & outcomes that drive an organisation towards digital innovation processes (Lazzarotti et al., 2011; van Geenhuizen, 2018).

The evaluation of inputs used to develop activities and the achieved outputs allows assessing the efficiency of a digital initiative.

The activities describing a digital initiative can be related to the development of digital capabilities and innovation culture, as well as to the use of digital approaches and technologies such as AI solutions, analytics, mobility, social media and smart embedded devices to develop new products, services, and proof of concepts, to better manage relations with customers, partners and stakeholders, to better understand and analyse consumers' behaviours, to change internal processes and, more widely, the value proposition to better navigate the emergent digital ecosystem.

The outputs are those results which are achieved immediately after implementing the activities for digital transformation. Examples of outputs are, among other things, the innovative solutions in terms of new digital products, services or processes; digital capabilities among employees and managers, innovative mindset, and so on.

Outcomes can be considered as short mid-term results of the activities. They concern the changes expected to result from digital transformation initiatives. Examples of outcomes are improved customer experience and satisfaction, more profound customers' insights and needs, reduced costs of operations, improved profitability, increased revenue, operational efficiency, product differentiation, reduced business risk, etc.

The outcomes require measurement at every phase of the digital transformation journey.

Moreover, the framework, in order to measure the different dimensions of organizational digital transformation is built on the concepts of performance, effectiveness and efficiency (Soderwuist and Godener, 2004). The notion of effectiveness is considered as the ability to generate a result, while the efficiency means how the result is achieved, also considering the ability to manage resources avoiding or producing wastes. Performance, therefore, are considered as broader concept that integrates and combines efficiency and effectiveness. Their combination results, for instance, in the attitude to transfer knowledge or technology exploited during a carried out project, and assessing and evaluating the employed resources. The integration means objectively measuring both goal achievement and resource used, according to an input-output ratio. This common approach (Werner and Souder, 1997), which focuses on both outputs and inputs, allows the measurement of goal achievement (outputs) as soon as it is observable, as well as the provision of continuous data on resource use (inputs) that might later improve or affect outputs.

The analysis of the literature on performance measurement in the field of R&D and Digital Transformation processes suggest that the outcomes of digital transformation initiatives can be comprehensively evaluated considering five performance perspectives: financial perspective; process perspective; customer perspective; innovation perspective; business models perspective (Bremser and Barsky, 2004; Lazzarotti et al., 2011; Solis, 2018).

The financial perspective considers the return on investments in resources and activities required to develop innovative outputs (i.e., technologies acquisition, digital innovations implementation, training, etc.).

This perspective represents a set of objectives of operational, financial and investment activities, and strategic objectives of the company's financial position should also be defined. The achievement of the strategic objectives of digital transformation enables the increase of the long-term shareholder value of the

company. The strategic goals of the customer, internal process and organizational capacity perspectives are specified by decomposing the goals of the financial perspective via drivers. According to this perspective, the value depends on the the cost of capital, the tax rate, and the duration of the firm's value growth, as well as by drivers of operational process management of the logistics network as revenue growth, working capital, supply chain operating costs, and asset efficiency. It follows that organisational digital transformation's objectives and dimensions to consider and measure are the increase of products or services sold, and consequent increase of the market share; extension of the customers served and improvement of customer experience; optimization of costs and use of resource.

The process perspective considers the ability to effectively manage and digitize processes in terms of quality, time and costs. Their management is monitored along the entire supply chain, from the demand identification to the delivery and resultant revenue management. To evaluate his perspective, Maydanova et al. (2019) suggest to refer to the Supply Chain Operation Reference Model (SCOR) (Christopher, 2005) according to which internal process drivers are performance, processes, practices, people; while strategic aims and dimensions to evaluate are determined as strategic characteristics of supply chain performance: Reliability, Responsiveness, Agility, Cost, and Asset Management Efficiency.

Performance under a customer perspective is seen as the level of engagement and involvement of customers or users in co-creation activities, and their degree of satisfaction. In particular, customer perspective drivers reflect the processes that occur in supply chain management and the factors that influence their changes, such as the obtainment of information about real demand; the management of customer relationships; the flexibility and efficiency for customers; the integrated end-to-end management of the supply process; the flexibility of resources; the focus on the processes that create value for customers; the effective use of resources and competencies of partners; the use of digital marketing tools.

In this vein, the identification of possible strategic objectives from the customer perspective, is based on the strategic model of the marketing mix and on strategic and digital marketing tools. It follows that the dimensions to consider and evaluate under this dimension are, among others, the assessment of current needs and challenges, as well as competencies and resources of partners or competitors; lead generation; improvement of the quality of the customer service,

store locators, distribution channels, delivery and revenue management (Maydanova et al., 2019).

The innovation and technology perspective captures the effects of the development and application of new digital solutions in terms of technologies, knowledge management and diffusion. Here performance is considered as a positive conversion of research activities and gathered knowledge into new products, services or organisational solutions. This transformation, if enabled by an effective employment and management of digital technologies can result in high performance. In this vein, the identification of possible dimensions to consider and evaluate are, among others, the improvement of the innovation capacity, intended as the attitude to generate innovative solutions; the attitude to change; the ability to apply and spread across the organisation the generated solutions (Neely and Hii, 2012).

Finally, the business model perspective measures the changes in value creation's dynamics. It is widely acknowledged that digital transformation is an enabler of business model innovation, and successful digital transformation initiatives impact longitudinally on many areas of business and in the way the business is conceived and exploited. In particular, inspired by Clauss (2016), to effectively evaluate the impact of digital transformation to the organisation's business model, three main dimensions to consider and evaluate are proposed: value creation, value proposition, and value capture. The value creation considers the value generated adopting and exploiting new technologies or new digital solutions; the value proposition focuses on the change and innovation provoked by digital transformation in terms of value offered and proposed to customers; the value capture defines, then, how value proposition is translated into revenues.

## **5 Findings and discussions**

Understanding the effectiveness and the value generated from digital transformation initiatives cannot disregard a careful and systematic evaluation of their effects on an organisation's performance.

As previously outlined, to date the measuring digital transformation progress in the organization even if essential, is still in its infancy. The analysis of the theoretical and practical literature, reveals the lack of studies on the subject.

Adopting the right performance measures and dimensions to detect the success of digital transformation and to achieve the expected business outcomes, is crucial to manage and drive this complex organizational change.

Attempting to fill this gap, the paper, based on the results of a comprehensive literature review on metrics and methods of performance measurement in R&D centres, and in Digital Transformations strategies, identifies the critical dimensions of performance measurement to take into account to evaluate the effectiveness and efficiency of digital transformation initiatives and their impacts on organisational performances.

These dimensions represent the building block of a framework proposed to measure and manage Organisations Digital Transformation in Industry 4.0.

The framework considers the notion of performance as the integration of the concepts of effectiveness and efficiency (Soderquist and Godener, 2004). It focuses, at the same time, both on inputs & resources, activities, and output & outcomes that drive an organisation towards digital innovation processes (Lazzarotti et al., 2011; van Geenhuizen, 2018).

The evaluation of inputs used to develop activities and the achieved outputs allows assessing the efficiency of a digital initiative. Then, five performance dimensions to evaluated the outcomes of digital transformation initiatives have been detected and discussed. These perspectives are included in the proposed framework and analysed. In particular, the reasons and purposes to measure each aspect are illustrated. Moreover, some key performance indicators and measurement methods are explained and listed.

## **6 Conclusions**

Starting from a comprehensive literature review on management model and performance measurement in the field of R&D and Digital Transformation, the research identifies and investigates key dimensions to take into account when measuring and managing the performance of organisations digital transformation. These dimensions represent the building block of a framework that we propose to evaluate digital transformation initiatives and their effects on organisational performances.

The framework is proposed with twofold implications. On the one hand, it can help executives to manage and evaluate such innovation initiative. On the other hand, it can support scholars to understand the conceptual foundations of

performance measurement and management of organisations digital transformation in Industry 4.0 to better carry out further studies aimed to investigate related strengths and limitations empirically.

Future empirical studies are required to validate the framework and test it within organisational contexts. Furthermore, the research should be extended through the identification and proposal of a set of guidelines and practical tools that suggest how to manage and evaluate the performances of companies in their digital transformation journey.

### **Abstract**

Digital Transformation and Business Model Innovation, in which Digital Age became a crucial enabler of development and competitiveness for organisations. Despite the relevance of this topic, which has recently increased due to the Covid-19, the search for solutions and ways to support tourism and cultural organisations in the adoption of digital innovations has not yet been structurally explored. In this sense, and in order to broaden the research stream, the article below aims, through the analysis of a case study of a Innovation Lab to support tourism organisations in promoting digital transformation and business model innovation to overcome the crisis, enabling growth dynamics, to highlight methods and approaches useful for both scholars and practitioners to promote innovation in organisations in times of crisis, starting from the identification of challenges and the consequent transformation into opportunities for growth and development.

**Keywords** – tourism innovation; digital transformation; business model innovation; case study

**Paper type** – Academic Research Paper

## **1 Introduction**

In the age of digital tourism, the capacity of a tourism organisation to produce a smart, sustainable, responsible and accessible offer requires innovative digital solutions that ensure integration with the territory and the safeguarding and enhancing of cultural heritage and landscape, as well as the comprehension and adaptation to customers' needs and attitudes. New products, services and tourism offers based on the new emerging demand, and a strategic and holistic vision of cultural and tourism development, allowing an increase of attractive capacity of the territory are required.

Consequently, the tourist offer requires an adjustment and realignment with the changes in demand mentioned above. Ease of travel, access to detailed and up-to-date information, the ability to personalise the way of using them, the simplicity and speed of purchasing services strongly affect the choice of destination. Therefore, Digital Transformation and Business Model Innovation processes become essential to improve the reputation and to increase the degree of customisation of bids, customer satisfaction, and therefore the attractiveness of the site, products and services offered.

Besides, after the covid-19 pandemic, Digital Transformation in the tourism industry has been heavily accelerated. Health and economic crisis, indeed, acted as an accelerator of pre-existent dynamics. Therefore, the innovation that was a hot topic, with the crisis upgraded to a mandatory priority. Tourism organisations due to the health protocols and new safety requirements have found to be forced to invest on innovation, to implement digital technologies, to embrace Digital Transformation, to rethink services, products, processes, and business models.

It follows that a further challenge in the digital ecosystem is the promotion and definition of conditions, roadmaps and management models for the implementation of digital innovation strategies to manage digital knowledge and foster continuous innovation (Nonaka and Takeuchi, 2019). However, these processes are not immediate, in particular for SMEs, distinguishing the tourism and cultural sector, where resistance to innovation and insufficient skills, finance, culture and attitudes are particularly accentuated. It follows that these organisations require forms of support to foster DT and BMI to improve offers, competitiveness, efficiency, as well as customisation and customer relationships.

Despite the relevance of this topic, the search for solutions and ways to support tourism and cultural organisations in embracing digital innovation journeys has not structurally explored yet.

In this sense, through the analysis of a case study of a Innovation Lab to support tourism organisations in promoting digital transformation and business model innovation to overcome the crisis enabling growth dynamics, the paper aims to highlight methods and approaches that are useful for both scholars and practitioners to promote innovation in organisations in times of crisis, starting from the identification of challenges and consequent transformation into opportunities for growth and development.

Moreover, the study contributes to the identification and proposal of the decalogue of challenges and that of opportunities during Covid19 pandemic, to intends to focus attention on the dimensions that must be grasped by organisations to be ready for generating digital innovative solutions for the relaunch of tourism industry.

The paper is structured as follows. Section two reviews the main literature on digital transformation and business model innovation. Section three and four discusses the conducted case study. Section five illustrates the research findings. Then conclusions and future research avenues are presented.

## **2 Digital Transformation and Business Model Innovation in Tourism**

In tourism, like other sectors, DT offers opportunities to scale, grow, improve efficiency and productivity, gain a competitive advantage and foster innovation. In the specific, in tourism, DT might contribute to innovate the offer, the destination management; to customize offers and develop new typologies of products, services, tourism packages; as well as to offer policy guidelines and insights for the development and improvement of local tourism ecosystems.

In this regard, it is essential to recognize that DT *“provides the tools, frameworks, and technologies to create and/or add value to tourism products and experiences but the success of digitalization depends on the capacity of the tourism sector to share, learn and collaborate”* (Dredge et al., 2018, p. 6).

Compared with other productive sectors, tourism presents a fragmented offer and its sub-sectors are inherently *labour intensive*, namely characterized by humanization and direct contact with clients. Therefore, by nature, reluctant to

innovation and digitalization (Meyer and Mayer, 2015). That means that for the tourism organizations, the path towards DT is complex and challenging.

Therefore, to guarantee an effective DT process in tourism organizations, a holistic vision that contemplates and engage the whole sector is needed. DT must be a process not only linked to technological development, but to the development and promotion of an integrated ecosystem, based on innovative solutions, that involves and creates value for all parties involved.

Moreover, technologies and digital innovation even though they can be new, they rarely impact radically on a market or ecosystem. What has the potential to be radical and disruptive is the way by which they are exploited. So, the logic behind technologies and the business model deriving from their usage and application. Hence, the concept of Business Model Innovation.

Tourism, as a highly competitive sector, requires Business Model Innovation as a differentiating factor to innovate, exploiting emerging digital technologies, the offer and to allow a tourism organization to take a leading role in the market.

Globalization of tourism flows, high competitiveness between destinations, sustainability, slow and smart tourism, the emergence of rural areas as new destinations, the development of new technologies supporting travels, and new travellers' needs contributed over the time to the creation of new market segments, niches, as well as the possibility of identifying new products and services allowing organizations to answer the changing demand of new travellers efficiently. Therefore, new or upgraded business models are establishing in tourism as enabling factors determining the arising of innovation management and Business Model Innovation in tourism.

Despite the relevance of this topic, further increased recently due to the Covid-19, the search for solutions and ways to support tourism and cultural organisations in embracing digital innovation journeys has not structurally explored yet.

On this vein, and to extend the research stream, in the following, through the analysis of a case study, of a Innovation Lab to support tourism organisations in promoting digital transformation and business model innovation to overcome the crisis enabling growth dynamics, the paper aims to highlight methods and approaches that are useful for both scholars and practitioners to promote innovation in organisations in times of crisis, starting from the identification of challenges and consequent transformation into opportunities for growth and development.

### **3 Methodology**

The methodology is based on an inductive research approach, represented by an exploratory case study. This research therefore examines an Innovation Lab developed to support tourism organisations in enabling digital innovation journeys to overcome the crisis triggered by the Covid19 pandemic, and focuses on how this management initiative supported tourism organisations in digital transformation and business model innovation, and how it helped to generate innovations that turned crisis into opportunity.

The data were collected thanks to the direct involvement of the authors in the activities of the analyzed Innovation Lab. The research was conducted following the approach of Yin (2009) to increase the validity and reliability of case studies. In particular, to ensure validity, the researchers used a variety of data collection methods. In particular, semi-structured interviews were conducted with tourism experts, operators and key territorial stakeholders (Spradley, 2016). In addition, thematic online webinars were organized with tourism stakeholders and local communities, following flexible approaches to understand informants' perspectives and revisit or confirm previously collected findings (Myers, 2013). The resulting data was then triangulated with theoretical insights from the literature review to reduce the typical bias of a single observation (Eisenhardt, 2002) and to identify reliable and valid findings.

### **4 Case study**

To understand methods and approaches employed to promote digital innovation in organisations in times of uncertainty, a case study has been developed.

The case study involved and Innovation Lab developed to support tourism organisations in enabling digital innovation journeys to overcome the crisis triggered by the Covid19 pandemic, and focuses on how this management initiative supported tourism organisations in digital transformation and business model innovation, and how it helped to generate innovations that turned crisis into opportunity.

Innovation Labs are conceived as management initiatives focused on creating spaces for creative and innovative thinking. They can take different forms, with different contents and actions, using a wide variety of human, organisational,

relational and technological resources, with the core objective of supporting the development of innovation activities (Santarsiero et al., 2019; 2020; 2021).

In particular, the Innovation Lab under analysis was developed to support companies wishing to undertake their digital innovation paths and to be able to generate innovative solutions for relaunching their business after the enforced blockage caused by the pandemic. The lab, thus, supported the engaged tourism organisations in designing and exploiting a digital innovation journey.

To this end, the Lab planned and implemented a series of initiatives structured around the principles of user-driven innovation, open innovation, agile and lean innovation, and stakeholder value-based and participatory innovation.

The activities were grouped into two main phases based on the broader objectives of the initiatives: i) identify challenges, ii) outline opportunities, that laying the foundations for informing and implementing a third phase aimed at defining and testing possible innovative solutions, according to an iterative approach of continuous and validated learning.

The first phase is based on the assumption that to redesign the future of tourism, and transform the crisis into opportunities for positive transformation, it was necessary to start from a diagnosis of problems and critical issues generated by the crisis. Therefore, the first phase is aimed at identifying the challenges of tourism organisations through an auditing of companies, operators accompanied by focus groups, semi-structured interviews, and a series of thematic webinars which involved the main players in the sector, i.e. entrepreneurs, experts, tour operators, DMOs, institutions, citizen, and tourists.

The second phase, then, is aimed to transform the challenges identified previously into opportunities for the revitalization and growth of tourism organizations affected by the pandemic. In this perspective, a first set of initiatives organized by the Lab consisted in an intra- and intersectoral action to explore, benchmark and analyze best practices and case studies on exemplary examples of projects, practices or initiatives that have allowed organizations to face the crisis in an innovative way.

The results of these actions served as inspiration and discussion material for the community of tourism stakeholders, experts, entrepreneurs, DMOs, citizens, tourists and institutions involved in another series of focus groups, semi-structured interviews and thematic online webinars. During these activities, and thanks to the support and guidance of the experts from the Lab, emerging

opportunities were discussed, clustered, prioritized and then adapted to the reference context.

The results of these phases served as an informative basis to stimulate innovative thinking and innovation capacity of the participating organisations. Thus, starting from identified challenges and opportunities, they were able to generate, test and validate possible innovative digital solutions in the form of new services, products, processes or business models that are helpful to foster development dynamics and enable the achievement of a sustainable competitive advantage.

## **5 Findings**

The case study contributed to understanding methods and approaches useful for both scholars and practitioners to foster innovation in organisations in times of crisis, starting from the identification of challenges and consequent transformation into opportunities for growth and development. The activities started by an on-field analysis considering the point of view of tourists, local communities, and tourism operators. The attention paid on the point of view of tourists was helpful to identify and understand new emerging tourism habits, needs and expectations. Moreover, the focus on local communities, allowed to involve them in the new path of innovation and territorial promotion. Finally, the consideration of the tourism organisations and tourism operators' point of view, allowed the identification of concerns and needs, as well as enabled the first attempt of stimulating their creativity and innovation capacity to rethink approaches, processes, services and products characterizing the regional tourism offer. At the same time, it was helpful to imagine and define new forms of communication and relational logic to guarantee the promotion of the territory and the future development of a tourism ecosystem based on authenticity, hospitality, wellness, security, and trust.

Thanks to these methods and approaches, the lab allowed the achievement of the results that are discussed below.

### **5.1 Identify challenges**

The first phase contributed to identify a decalogue of challenges to highlight the dimensions to consider to transform challenges into opportunities, and then

into innovative solutions for the recovery of tourism. Detected challenges (Figure 1) will be listed below.

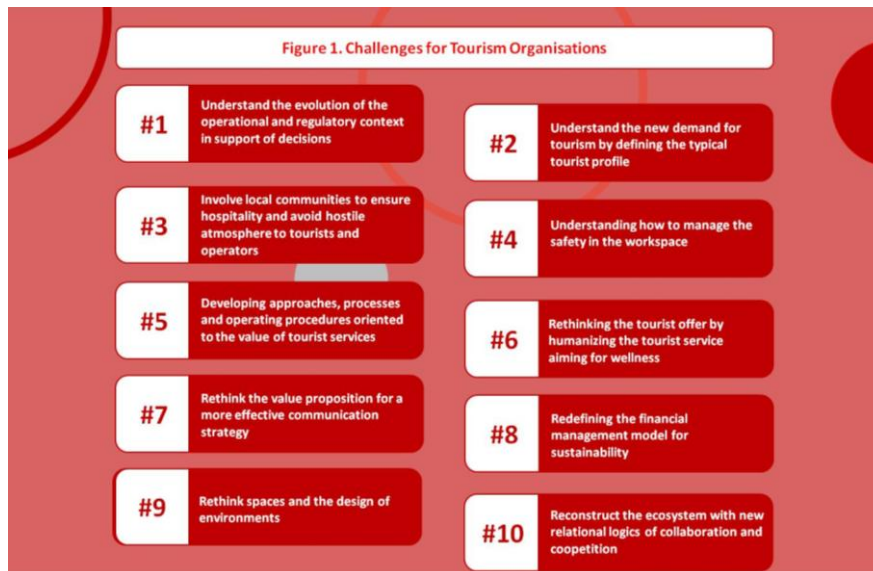

Figure 1. Challenges for Tourism Organisations

#### 5.1.1 Understand the evolution of the operational and regulatory context in support of decisions

Sector studies and national and international research present different possible scenarios for the tourism sector post Covid-19 (SKIFT, 2020; UNWTO, 2020). Regional tourism companies are therefore called to understand the changes taking place, to get informed, to catalyze and analyze data which will act as a support in taking the strategic decisions that will characterize the upcoming activities. Among these, the information related to rules, protocols and precautionary measures to adopt to manage tourism activities in full regularity and security are relevant. It is also important to gather relevant information in terms of strategic value, such as the 'sentiment' of tourists during the covid19, the propensity to resume traveling, the expense, the type and duration of the new trips that will be scheduled.

### *5.1.2 Understand the new demand for tourism by defining the typical tourist profile*

The customer care will be the basis of a successful innovation path (Desouza et al., 2008). Regional experts and operators are paying attention and curiosity to new habits of post-pandemic tourists. Results of surveys (Moggia, 2020) shows how tourists are impatient to resume travelling, despite being worried about the pandemic and the possibility of contagion. 97% of them say they want to leave within 6 months of the end of the emergency, and 66% within two months. Another interesting data to consider is that new priority tourists will change their habits, behaviors, needs and travel flows when they start traveling again.

The means chosen for the trip will also tend to change. New tourists will travel by own vehicles paying more attention to sustainability and ecology. The way of packing and filling bags will also change. Tourists will bring along products that will guarantee safety and hygiene. Moreover, travel seasonality will also vary. Travelers will distribute holidays throughout the years, avoiding festivity periods. Finally, customers' needs will vary. Customers will want to feel safe and receive all the necessary guarantees. But to obtain that they will also be willing to spend more.

### *5.1.3 Involve local communities to ensure hospitality and avoid hostile atmosphere to tourists and operators*

Local communities can become part of the differential value of a tourist destination. The local community can become the differential factor that drives a tourist to choose a vacation destination. They can guide tourists in experiential activities, to discover traditions, customs and unique paths, which go beyond mass itineraries, which respond to the 'slow tourism' demand that is re-emerging.

At the same time, the resident's perception of the possibility of reopening must be considered in order to protect the safety of the premises as well and ensure collaboration in promoting a welcoming and not hostile atmosphere towards tourists who will return to attend the regional points of interest. It is therefore necessary to consider both the citizen accustomed to the flows of tourism and potentially afraid of the new incoming masses, and also the residents of the more rural areas that presumably will welcome the new emerging forms of tourism.

#### *5.1.4 Understanding how to manage the safety in the workspace*

In order to be able to offer tourists an experience of well-being in the name of hospitality and authenticity, it is necessary to guarantee the worker the safety conditions so that he can feel protected and able to perform his functions. The tourist will perceive trust and safety only if the tour operator and the worker in every job feels safe and perceives these elements firsthand. It therefore becomes essential to make the accommodation and tourist facilities safe equipping workers with all the necessary personal protection. Moreover, new tools and approaches should be identified to train employees on new protocols and new emerging practices regarding reception and the use of the digital technologies for managing new processes that will characterize the tourist offer that will be developed in the future.

#### *5.1.5 Developing approaches, processes and operating procedures oriented to the value of tourist services*

The quality of provided services is the distinctive element of a company aiming at creating and delivering value to customers.

The adaptation to the hygiene, sanitation and social distancing standards imposed by the Covid-19 requires the completion of some new services by tourism companies. It will be necessary to avoid queues at the entrance, distribute arrivals at different times and days to avoid gatherings; breakfast will no longer be a buffet, the restaurant must ensure the right space between the tables; rooms, fabrics and various objects must be sanitized after each use, etc. Therefore, it will be necessary to rethink each operating method, service, process characterizing the activity before the pandemic and adapt it to the new required standards.

#### *5.1.6 Rethinking the tourist offer by humanizing the tourist service aiming for wellness*

This lockdown phase offers the opportunity to rethink and redesign the tourist offer on the basis of emerging trends and needs emerged following the new protocols, preferences, and habits that will characterize the new categories of tourists.

The reopening, which will take place gradually, will initially affect intraregional tourists, then interregional ones, and then reopen national borders not before

2021. Therefore, an internal proximity tourism favoring nature, villages, rural areas, large and uncrowded spaces will characterize the new scenario. Consequently, the tourist who initially will only travel in the region, will be led to discover new places and itineraries little advertised and outside traditional circuits.

These aspects, if properly enhanced and integrated into the regional tourist offer, can act as a distinctive and attractive element for the entire region. However, local traditions, rituals, including religious ones, flavors, festivals, the cultural heritage fragmented and immersed in rural contexts, can act as attractors only if rethought and reorganized according to managerial methods and new imposed requirements.

#### *5.1.7 Rethink the value proposition for a more effective communication strategy*

To date, communication has proved to be the only form of contact with the loyal customer. Therefore, communication activities should not be interrupted during the lockdown. Therefore, it is essential to adopt storytelling to tell what is being done to better prepare for the restart and to guarantee the right level of hygiene, safety that will convince tourists to come back. However, communication is also and above all a promotional tool for acquiring new customers. Communication strategies that target and convince new post-pandemic tourists to choose the destination must be planned. After rethinking the offer, therefore, the proposed value proposition must be communicated effectively and through the right channels.

#### *5.1.8 Redefining the financial management model for sustainability*

Currently, one of the main problem for companies and tour operators is the lack of cash due to the lockdown and the consequent decrease, if not zeroing, of turnover. Reservations have been cancelled, and all the scheduled plans need a review.

At this stage, customers are paying more attention to flexibility and unwilling to pay for a holiday they have been forced to cancel. It is therefore necessary to identify flexible mechanisms that protect operators and companies by guaranteeing them immediate receipts to face fixed costs and recurring expenses. Moreover, flexible mechanisms to 'cuddle' customers by inducing them to book, reschedule (also for the future) in full security and without risk must be imagined.

With a view to projecting the objectives towards a new tourist offer, it is also necessary to imagine new sources of revenue such as results of new types of experiences and services that will be offered. New digital and virtual experiences, new services provided thanks to the connection with other supply chains, such as agri-food, transport, ICT, publishing and entertainment.

#### *5.1.9 Rethink spaces and the design of environments*

Social distancing seems at the moment the only measure against Covid-19. In addition to rules and behaviors to adopt to respect the minimum safety distances, spaces must also be reorganized to avoid gatherings. However, building elements for social distancing can inhibit the client and contribute to provoke anxiety and fear. Therefore, creative solutions based on design and digital are required to comply social distancing and maximize company's productivity, as well as instill customer safety.

#### *5.1.9 Reconstruct the ecosystem with new relational logics of collaboration and cooptition*

The crisis accelerates trends and dynamics already underway, emphasizes on the criticalities of the regional tourism system, which appear as fragmented in the distribution of cultural heritage and sites of interest, and above all in relations and logics of collaboration and cooptition between organizations, as well as in relationships with the decision maker and publicly owned entities.

Therefore, an overall rethinking of the entire regional tourism ecosystem appears necessary. For this purpose, it is necessary to create synergy, involve and systematize the various experiences of stakeholders, both public and private and foster an effective dialogue that consider data, trends and future scenarios. It is necessary to leverage the creation and promotion of the regional love mark which requires a responsible, sustainable approach and a feeling of true love towards the territory and which aims to promote its identity by involving private and public operators, as well as local community.

### **5.2 Identify opportunities**

The second phase contributed to identify a decalogue of opportunities for the reboot of the tourism after the pandemic. Detected opportunities (Figure 2) will be listed below.

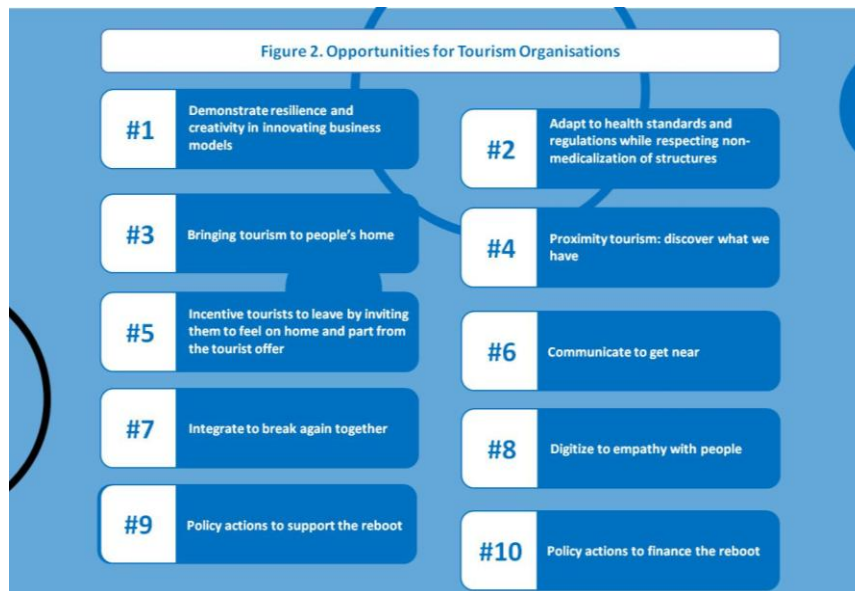

Figure 2. Opportunities for Tourism Organisations

#### 5.2.1 Demonstrate resilience and creativity in innovating business models

Resilience is one of the essential qualities for an entrepreneur, an innovator, an organization that wants to move with the times and play a leading role in the current scenario in which it operates. Covid-19 has imposed a long freeze that has brought tourism businesses in particular to their knees and has given rise to a new concept of normality that has suddenly thrown the "sharing economy" into crisis, enabling new habits and behaviors that bring about the necessary change in processes, services and operations. For many businesses, therefore, it will no longer be conceivable or profitable to operate in the traditional way. There is a need to be creative and think outside the box by generating solutions that are sustainable and useful even after the pandemic. It is therefore necessary to focus on new revenues from ancillary services, redesign offers and packages, provide for the possibility of upselling and cross-selling, and create synergies with other operators.

#### 5.2.2 Adapt to health standards and regulations while respecting non-medicalization of structures.

Accommodation providers and tour operators must adapt to current regulations and equip themselves with the necessary PPE to ensure and convey

safety and confidence to customers. It is therefore necessary to pay close attention to adapt to the rules and protocols and equip the structures with what is necessary for hygiene and sanitation, but without risking medicalization of the structures. So there are many opportunities for those who want to focus on the design of PPE and items for social distancing, on the packaging of cleaning products for sanitation and on the creative design of health control processes (thermal scanners; measurement of body temperature, serological tests, etc.) taking into account the different target customers. PPE, sanitation and social distancing will lead to standardization of procedures and objects. Those who manage to stand out will gain a significant competitive advantage, especially in a sector where differentiation is the key to success.

#### *5.2.3 Bringing tourism to people's home*

Many businesses reinvented themselves and adjusted to this time, so as not to remain idle and succumb to the enormous fixed costs that gave no respite even during the months of closure.

Citizens have got into the habit of buying online and getting everything at home, enjoying virtual experiences and services and meeting remotely. Consequently, many businesses in tourism have also worked to adapt to the new trends. Practices that are necessary to face the crisis, but above all they can be fundamental in this relaunch phase, integrated with communication strategies to generate interest, curiosity, expectation and make tourists leave, return to the familiar places or explore new ones that they can rediscover through these actions.

#### *5.2.4 Proximity tourism: discover what we have*

Staycation is the most popular term advertising vacations close to home. According to surveys conducted by Officina Turistica (2020), short-term travelers who perceive a high degree of uncertainty prefer destinations in their own region or, at best, in neighboring regions. This is an opportunity to enhance territories, to discover, rediscover and fall in love with closely country's treasures, which are too often snubbed at the expense of more glamorous destinations and beyond regional and national borders.

#### *5.2.5 Incentive tourists to leave by inviting them to feel on home and part from the tourist offer*

The tourist must be at the heart of the tourist offer. Covid-19 does nothing but accelerate the trends already underway in recent years that saw the emergence of human-centered approaches aimed at co-creating itineraries, products, services directly with the customer, guaranteeing him the opportunity to live unique experiences as a protagonist. Tourists have always wanted to feel pampered, to be desired, to "demand" special attention and today, according to Covid-19, they will want even more to feel at home in the places they choose.

#### *5.2.6 Communicate to get near*

Communication, especially in tourism, is an essential strategy to attract tourists' interest and convince them to visit a place. Especially at this time, it is essential to communicate in order to convey the message that the destinations being advertised are safe, to build trust, and to convey a sense of well-being and authenticity.

The implementation of promotional and communication strategies to convey trust, safety, authenticity and well-being is a fundamental action that allows destinations and operators in the sector to reconnect with customers and attract new tourists.

#### *5.2.7 Integrate to break again together*

Today, communication is the only form of contact with the loyal customer. In this sense, it is important not to break contact at this stage, but to have a different communication. For this reason, it is important to adopt storytelling practices, especially used in this phase, to tell what is being done to better prepare for the new start and guarantee the right level of hygiene and safety that will convince tourists to return. However, communication is also and above all a promotional tool to attract new customers. It is necessary to plan communication strategies that will influence and convince new tourists to choose the proposed destination after the pandemic.

#### *5.2.8 Digitize to empathy with people*

Now that social distancing seems to be the only certain precaution against Covid-19, digital technology plays a fundamental role in guaranteeing operators in the sector both to get in touch with tourists through digital promotion and communication channels, and to convert practices, processes and contactless services aimed at improving the customer experience in all phases characterizing the planning and use of an experience.

There are many initiatives and solutions developed in this regard. Digital menus; app to manage entrances and queues in front of museums, clubs; solutions for booking appointments, activities, experiences; digitize check-in, order and purchase directly from the smartphone.

The implementation of these services also offers a valuable opportunity for operators to profile and get to know customers, so that they can then improve and customize the offer based on the real preferences of customers.

#### *5.2.9 Policy actions to support the reboot*

Any action that can be taken to facilitate the restart of the sector cannot be separated from the policy actions of the public policy maker, who must act as a guide and reference for operators. In addition to measures relating to rules to be followed, protocols and containment measures, strategically targeted actions and fiscal, monetary and prudential measures, as well as private sector burden-sharing measures will play an essential role.

#### *5.2.10 Policy actions to finance the reboot*

To reboot, organisations need to be able to turn challenges into opportunities and take concrete actions aimed at generating and implementing effective, innovative and sustainable solutions. These actions represent investments for the actors who want to develop and implement them. In order to support the work of these subjects, public and private institutions promote investment support measures (credits, loans).

## **6 Conclusions**

The coronavirus pandemic poses dramatic challenges for businesses. No industry is spared the disruption caused by Covid-19. Workforce issues, supply chain disruptions, lost demand, employee safety, financial and market volatility,

and cash flow issues are just some of the problems companies are currently facing.

However, the pandemic can also be a good opportunity for companies to embark on new journeys, such as rethinking the business model, improving innovation capabilities and embarking on the digital transformation process to remain competitive and strengthen the business. Certainly, these "innovation journeys" are not effortless and require resources, competence, culture and attitudes that are not even easy to raise and manage.

This paper uses a case study to highlight methods and approaches useful for both scholars and practitioners to foster innovation in organisations in times of crisis, starting from the identification of challenges and consequent transformation into opportunities for growth and development. Moreover, the study identifies the challenges and opportunities distinguishing the uncertain current socio-economic landscape and provides useful guidelines and sources of inspirations for tourism practitioners aiming at starting digital innovation journeys.

Future developments of the research will focus on the development of exploratory research of further case studies in the field and on the assessment of the impact of the described initiatives.

### Abstract

Organizations experience multiple challenges in the modern era, and to maximise performance and value creation, they typically require resilient and committed employees. Despite the body of literature on HRM and organizational behaviour, there is a rare studies which examined the impact of learning organization on employee resilience, especially in the service sector (banking) in developing countries like Pakistan. This study aims to develop a serial mediation model that addresses research gap between adaptability and self-efficacy in learning organizations with this commandment in mind. The findings of this study are based on the principles of resource conservation theory. A cross-sectional survey of 298 employees in Pakistan's banking sector was used in this study. Structural equation modelling was used to test the study hypothesis empirically. According to the findings, learning organisation has a positive impact on employee resilience. Furthermore, our

findings revealed that serial mediation analysis of adaptability and self-efficacy positively mediates the relationship between learning organization and employee resilience. Theoretically, this study offers valuable insights to HR managers for improving workplace resilience, which can help create a suitable engaged workforce. The future implications of human resource management principles and practices are discussed.

**Keywords** – Learning organization, Employee resilience, Adaptability, Self-efficacy

**Paper type** – Academic Research Paper

## 1 Introduction

Given turbulent uncertain times, the concept of employee resilience is receiving increasing attention in many organizations. Importantly, organizations have to respond to external threats in the business environment, resource scarcity, technological advancements and changes due to pandemic in the economic and political environment. Succeeding in this challenging, unpredictable and drastically evolving environment is dependent upon the resilience of an organization and its constant ability to adapt to changes. Learning organization is an emerging aspect for organizations to adopt and respond timely in the dynamic environment due to competition in the industry (Malik and Garg, 2020).

More attention is thus warranted to understanding how and why learning organization is an imperative for organizations to develop resilient workforce, while other scholars ignored the role of adaptability and self-efficacy. In this way, our study explored the influence of learning organization on employee resilience with potential serial mediation mechanism of adaptability and self-efficacy to know better understanding. In the business world, employee resilience and learning organization are widely regarded as a critical sources of business excellence and competitive advantage in an increasing changing environment due to uncertain market fluctuations. Learning organization and employee resilience is receiving increasing attention at the micro-macro level perspective. Resilience is defined as the ability of an individual to bounce back from a traumatic experience and is related to the capacity to recover from a setback, any difficult situation or toughness (Bardoel et al., 2014). Prior research explored HRM practices with employee resilience (Tonkin et al., 2018).

Several studies conducted research on organizational capabilities with organizational resilience (Duchek, 2019). Importantly, other studies have failed to

examined the role of learning organization on employee resilience (Nyaupane et al., 2020). Similarly, there has been less previous evidence on adaptability and self-efficacy as a mediation effect to know the indirect impact on employee resilience (Richard, 2020; Nisula and Olander, 2020). Despite the evidence of a relationship between learning organization and employee resilience (Malik & Garg, 2020). However, employee resilience has been overlooked by the previous research in the uncertain times for sustainability of organizations. A recent study highlights that “to date resilience has been inadequately theorized and empirically tested within a work setting” (Cooke et al., 2019, p. 1252). Previous research paid rare attention on learning organization with employee resilience in the existing literature (Jiang et al., 2021). For this reason, this study addresses a research gap by responding a recent call to explore learning organization and employee resilience via serial mediation mechanism of adaptability and self-efficacy (Richard, 2020). Importantly, this study is to understand why so many employees in banking sector of Pakistan are high or low resilient and what exactly are the reasons and factors that affects resilience like optimism, physical fitness, relationship with colleagues, working environment, culture etc.

Previous research on adaptability and self-efficacy in the context of employee resilience and having to learn organisations has been limited (Tokin et al., 2018). Self-efficacy, according to early research, refers to the growth of resilience by virtue of the victories people have while completing job duties, obligations, and accountabilities (Bandura 1989). Furthermore, earlier studies has shown that employees' ability to rapidly recover from disturbances is critical for them to undertake well in an uncertain work environment (Shin et al., 2021). Ego refers to the growth of resilience by allowing people to succeed as they traverse position assignments, responsibilities, and obligations (Bandura 1989).

Previous research clarifies adaptability are perceived by employees as contributing to an ability to adapt to changes, thereby extending the employee resilience literature in public sector (Dahles & Susilowati, 2015). However, this study examined employee resilience in the private sector (Banking) which is neglected by scholars. It has been suggested to explore the serial mediation mechanism of adaptability and self-efficacy especially in the service sector in context of developing country (Pradhan et al., 2021). Prior research demonstrated that adaptability is important for survival of organizations if they adopt change initiatives for the competitiveness (Orth and Schuldis, 2021).

The present study contributes to this literature by explaining how learning organization affects employee resilience in the workplace. A notable strength of our research lies in expanding knowledge on the serial mediation mechanism of adaptability and self-efficacy which learning organization is linked to employee resilience. Second, the present study broadens knowledge on the antecedents of employee resilience by demonstrating how learning organization activates employees to survive in challenging workplace environment. In so doing, it responds to recent calls for further research in the area, as exemplified via an excerpt: To date, there has been very little research on the factors that foster workplace resilience and its impact on work outcomes, and there has been only a constrained interconnectedness of multiple perspectives to describe what resilience evolves (King et al., 2016, p. 783).

This study has numerous theoretical contributions. Firstly, this study examined the relationship of learning organization on employee resilience, it is an emerging phenomenon with under-researched in the existing literature. Secondly, our study explored serial mediation model of adaptability and self-efficacy. Adaptability and self-efficacy are important drivers towards resilience for employees at the workplace. In this way, this is an original contribution to the body of knowledge. Finally, this study conducted in the developing country context (Pakistan) especially in the service-sector (banking). Previously scholars rarely examined this sector and this geo-graphical region. For this reason, this study also contributes contextual/sectoral gap to studied this novel phenomenon.

### ***1.1 Conservation of resources theoretical perspective***

Shin, Taylor, and Seo (2012) argue that resilience is an individual resource that can be enhanced, based on conservation of resources theory (Hobfoll 1989, 2010). Employee resilience is a resource that can be valuable regardless of organizational change, according to our findings, and that learning organizations, adaptability, and self-efficacy can effectively establish and implement resilient workforces. Pertinently, this resource should help employees achieve goals like organizational performance and competitiveness, which helps employers achieve goals like improved organizational performance. As a result, the value of proactive resourcefulness practices is explained by COR theory. Learning organization in particular coping skills, for example, could be beneficial after a loss of resources. Comparably, COR theory explains the importance of employee

involvement to the extent that it enables staff members to prioritize the available services that must be preserved in a crisis.

### ***1.2 Serial Mediation of Adaptability and Self-Efficacy***

Adaptability and self-efficacy were considered as a potential mediators that may influence the relationship between learning organization and employee resilience. Adaptability has been defined as the "behavioural capability to leverage work resources in order to become resilient worker (Kuntz et al., 2017, p. 224). Similarly, adaptability is a to reestablish a state of fit with a changing environment. Importantly, self-efficacy refers to employees' judgments toward their capabilities to organize and execute the required actions to attain designated types of performance (Bandura, 1986). Prior research revealed employees with high self-efficacy perform more challenging tasks than with low level of self-efficacy at the workplace (Kasikci & Alberto, 2007). In the existing literature, there is dearth of studies on adaptability and self-efficacy as serial mediation to know the indirect effect on employee resilience (Djourova et al., 2019). In this way, this study attempts to highlight the role of employees to adaptability and self-efficacy at the workplace during challenging working environment.

## **2 Materials and Methods**

This explanatory deductive study explains what considerations (potentially learning organization, ability to adapt, and self-efficacy) are important in the regulation (employee resilience) (Blaikie, 2003). In the defined research, a quantitative research approach was used to understand the attitude, uniqueness, and actions of the targeted population (Creswell & Creswell, 2017). For data collection, survey questionnaires were used, which were quantitative so that associations between varying factors could be explored (Saunders et al., 2009). Purposive sampling was used in our research. Because of the precision of this measurement and the large number of responses that could be gathered in the limited circumstances of the COVID-19 pandemic, an online survey was chosen. As a result, our research gathered 298 responses from employees and managers in Pakistan's banking sector. HR Managers, HR Officers, Compliance Officers, Branch Managers, Operation Managers, and Customer Service Officers-Cash and Clearing made up the study's sample population. Our research focused solely on

the Sindh Province of Pakistan, collecting data from both private and public banks in Karachi's metropolitan area.

### 2.1 Measures

This study was adopted eight-items of learning organization (Yang et al., 2004). Adaptability was assessed as a potential mediator by using a four-item questionnaire (Dam & Meulders, 2021). Also, our study measured five-items of self-efficacy using Chen et al., (2001). Employee resilience eight-item scale was adopted from Luthans et al., (2007)

## 3 Results and Discussions

### 3.1 Power Analysis

Using the G\*Power 3.1.9.2 software, a priori power analysis was used to determine sample size (Faul et al., 2007). The findings show that an 85-person sampling frame is required to achieve 80 percent statistical power with an understanding implies (0.15) at a significance level of 5% (0.05) again for framework. To achieve our research objectives, we used 298 samples, which is similar to other standard guidelines (Hair et al., 2010; Kline, 2005; Roscoe, 1975).

#### *Common method bias*

The Harman single factor test assessed that there is approximately 26% variation in our data, indicating no common method bias. The variance inflation factor (VIF) values in Table 2 are less than 3, indicating that collinearity is not a severe issue in this study (Diamantopoulos and Siguaw, 2006).

Table.1 Demographic Characteristics

Demographic Variable	Characteristics	Frequency	Percentage (%)
Gender	Male	175	58.73
	Female	123	41.27
	Total	298	100.00

	ER3	0.668	1.481				
	ER6	0.746	1.809				
	ER7	0.838	1.927				
	ER8	0.596	1.322				
Self-Efficacy (SE)				0.732	0.793	0.760	0.514
	SE1	0.769	1.210				
	SE2	0.666	1.071				
	SE4	0.711	1.188				
Adaptability (ADP)				0.792	0.797	0.865	0.615
	ADP1	0.777	1.714				
	ADP2	0.761	1.652				
	ADP3	0.768	1.690				
	ADP4	0.830	1.823				

**Note:** Excluded Items due to low loadings (LO7, ER1, ER4, ER5, SE3, and SE5) VIF=Variance Inflation Factor, CA= Cronbach Alpha, (CR)=Composite Reliability, AVE=Average Variance Indicator

The Heterotrait-Monotrait ratio was also used to confirm discriminant validity, as per Henseler et al. (2015). (HTMT). As shown in Table 3, each HTMT ratio was less than the 0.85 restraining threshold.

Table 3. Discriminant Validity Heterotrait-Monotrait ratio (HTMT)

	ADP	ER	LO	SE
ADP				
ER	0.610			
LO	0.810	0.697		
SE	0.832	0.732	0.789	

### **3.2 Structural equation modelling: Direct analysis**

The bootstrapping technique was used to determine the parameter's statistical importance (5,000 subsamples, one-tailed significance). H1 and H4, Adaptability (ADP) and Self-efficacy (SE) ( $O=0.619$ ,  $t=17.089$ ,  $p=0.000$ ; and  $O=0.338$ ,  $t=9.601$ ,  $p=0.000$ ) were significantly associated with employee resilience (ER). Moreover, H2 and H3 Learning organization (LO) was shown to be substantially related with adaptability and self-efficacy ( $O=0.769$ ,  $t=24.522$ ,  $p=0.000$ ;  $O=0.622$ ,  $t=18.007$ ,  $p=0.000$ ).

### **3.3 Serial Mediation analysis (indirect effect)**

The table.4 demonstrate serial mediation analysis was performed to test H5 and H6. Our results revealed H5, Adaptability (ADP) mediates a significant relationship between learning organization and employee resilience ( $O=0.476$ ,  $t=11.481$ ,  $p=0.000$ ). Importantly, H5 Self-efficacy (SE) mediates a positive link between learning organization and employee resilience ( $O=0.210$ ,  $t=7.885$ ,  $p=0.000$ ).

### **3.5 Coefficient of determination ( $R^2$ )**

The regression model's coefficient of determination ( $R^2$ ) was used to assess the research constructs' predictive power (See Table.4). The coefficient denotes the percentage of variance explained by the predictor (independent) variable in the dependent variable. Although the dependent variable Employee Resilience (ER) (0.726) has a model  $R^2$  of 0.726, it only accounts for 72 percent of the total variation in the construct employee resilience. Which can be explained by the interaction of individual constructs; learning organisation (LO). Serial mediation constructs ability to adapt and self-efficacy (0.591) and (0.385), respectively, show 59 and 38 percent.

Table 4. Results of hypotheses testing (direct and indirect effect)

Construct	Original Sample (O)	Sample Mean (M)	STDEV	t value	p-value	Decision
<b>Direct Effect</b>						
H1: ADP----> ER	0.619	0.618	0.036	17.089	0.000	Supported
H2: LO ----> ADP	0.769	0.770	0.031	24.522	0.000	Supported
H3: LO ----> SE	0.622	0.626	0.035	18.007	0.000	Supported
H4: SE ----> ER	0.338	0.341	0.035	9.601	0.000	Supported
<b>Serial Mediation Analysis (Indirect Effect)</b>						
H5: LO ---> ADP --->ER	0.476	0.476	0.041	11.481	0.000	Supported
H6: LO--->SE--->ER	0.210	0.214	0.027	7.885	0.000	Supported

Construct	Coefficient of determination (R <sup>2</sup> )	Adjusted R <sup>2</sup>
Adaptability	0.592	0.591
Employee Resilience	0.728	0.726
Self-Efficacy	0.387	0.385

Figure.1 Structural Equation Model (Extraction from SmartPLS 3.0)

### **3.6 Theoretical Contribution**

Theoretically, this study contributes to the academic argumentation on employee resilience in a number of ways. To begin, this study looked at the impact of learning organisations on employee resilience, which would be rarely studied in the service sector in developing country context such as Pakistan. Second, serial mediation analysis of adaptability and self-efficacy was examined in this study. This is an original contribution to the body of knowledge on employee resilience. Finally, in order to gain a better understanding of the micro-foundation of employee resilience on an individual level, this study empirically tested theory conservation of resources. In terms of COR, we make an argument that resilience can be a precious asset irrespective of whether or not change is present, because even if there is no transition within the organization, employees' non-work lives are often turbulent, so employee resilience can still help with attitudes and behaviours.

## **4 Conclusions**

Drawing upon conservation of resources theoretical perspective. This research examined the influence of learning organization on employee resilience via serial mediation mechanism of adaptability and self-efficacy in the banking sector. The data revealed learning organization is driver for employee resilience. Also, our study found that adaption and self-efficacy mediates positive link between learning organization and employee resilience. Importantly, this study extends body of knowledge on resilience literature. Our study also suggests conservation resource theory is a valuable for organizational competitiveness and business excellence. Furthermore, this study suggest future research may explore employee resilience in the uncertain times such as recent COVID-19 pandemic to get better understanding of working environment and employees' response in challenging circumstances. Finally, our study provides guidelines to HR manager and policymaker to response quickly in uncertain times and they should also train and motivate their employees as they can adapt any change quickly to achieve sustainability.

### Abstract

The COVID-19 global pandemic has broken healthcare systems globally and locally in this on-going uncertain time. In that instance, the European Union (EU) was not an exception. The main aim of this study is to highlight the contemporary challenges faced by the pharmaceutical industry in the European Union region (EU). Importantly, this topic is emerging but under-researched in the existing literature. For this reason, this study attempts to bridge the research gap by examining the issues. Methodologically, this study employed a systematic literature review method to generate new knowledge. Our study conducted data analysis with Microsoft Excel software. This study analysed 27 published studies from Web of Science, Scopus, and indexed journals from the top reputed Chartered Association of Business Schools (CABS). Our study highlighted the complexity of EU pharmaceutical industry through the systematic literature review method. The systematic review revealed that the vulnerability of EU pharmaceutical industry, such as default patent system, ineffective research and development (R&D), debate on the role of alliances, low level of expertise in EU health care system and pharmaceutical supply chain management.

**Keywords** – Contemporary Challenges, Systematic-literature Review, Pharmaceutical Industry, European Union (EU).

**Paper type** – Academic Research Paper

## 1 Introduction

The COVID-19 pandemic creates inefficiencies in the health care system by having devastating consequences. In that instance, the European Union (EU) was not an exception, while the pharmaceutical sector is a highly capital and knowledge-intensive industry in the world, which spends around 15 % of the total revenue on research and development (R&D), (Downs & Velamuri, 2018). Besides, EU has the second largest market by sales account in the world and the increment of total investment becomes more than double during the pre- pandemic period (Azierta, 2019). For-instance, the spending in the health sector was an average 8.3% of GDP and the pharmaceutical production cost was almost one-sixth of total health expenditures in 2019. The retail pharmaceutical bill was around Euro 190 billion in 2018 (OECD, 2020) and it is a major contributor to the investment in innovation (European Commission, 2020).

According to (le Deu & Santos Da Silva, 2019), the increment of total investment in Europe's biotech firms was more than double, for instance, during the seven-year period (2005-2011) it was \$5.1 billion but it upgraded more than twice in the next seven-year period at 11.9 billion between 2012 to 2018. That is why public expectation to get access to safe, eminent, and affordable medicines, therapies, and vaccinations is an upward demand in general, although the advantages may vary in European countries (European Commission, 2020). Moreover, there remains a scarcity of pharmaceutical products in the EU, and patients do not have access to medicines due to the shortage. This practicality has been demonstrated amid the Covid-19 pandemic in Europe and raises an important issue as to how to ensure the availability of pharmaceutical products during a crisis. European Commission recent reports and Global Health Summit of G20 Nations at Rome in 2021 suggest coordinating pharmaceutical and nonpharmaceutical interventions and emergency response.

It is true that typically the pharmaceutical business in the EU is currently facing several challenges, such as the growing number of aging people, rising burden of diseases regarding Covid-19 pandemic, patients, having difficulty in bearing the cost of medicines, increasing dependence on medicines and pharmaceutical products imported from non-European countries, and business formulation responding to the investment capacity (European Commission, 2020).

Our study argues that previous research neglected the contemporary challenges of EU pharmaceutical industry and it becomes ineffective to tackle the

crisis period. The main aim of this study is to explore the contemporary challenges faced by the pharmaceutical industry in the European Union region (EU). Importantly, this topic is emerging and under-researched in the existing literature. For this reason, this study attempts to bridge the research gap to highlight an important issue.

## 2 Materials and Methods

This study employed a systematic literature review method (Denyer, & Tranfield, 2009). Our study adopted inclusion and exclusion criteria after constructive reviewing articles from Web of Science and Scopus databases along with the ranked journals in CABS to search the following key terms “challenges” and “pharmaceutical industry” during the period from January, 2011 to April 2021: The terms are set to be searched in the title, abstracts, and keywords of the publications. This study reviewed 2701 papers and selected only 21 due to relevance of phenomenon such as challenges in the pharmaceutical industry of EU and 6 more papers are selected from the past of the period to have an overall scenario of the contemporary challenges in pharma industry typically in EU.

*Figure 1. Web of Science's record of 501 papers*  
Source: Authors (2021)

*Figure 2. Scopus's record of 2200 papers*  
*Source: Authors (2021)*

For this study's relevance on the existing literature of contemporary challenges in pharmaceutical industry, we limit the fields of results to Pharmacology, Toxicology and Pharmaceutics, Medicine, Biochemistry, Genetics and Molecular Biology, Chemistry, Chemical Engineering, Business, Management and Accounting, and Social science, specially, the search mainly focus on EU so other countries and regions are excluded. The search includes the most updated journal articles, review papers, and conference papers and published in English only. After removing the duplicate results, we have 689 relevant papers.

In the next step, for high quality assessment, we sort out the most quality publications among 689 papers from high-ranking journals based on the standard of the Chartered Association of Business Schools (CABS), which are evaluated at the ranks of 4\*, 4 and 3. After this step, we narrow the selection to 137 papers. Then, we read the title, abstracts, and keywords of these papers to determine whether they are relevant for the research purpose or not. Finally, we selected 27 papers for constructive review. Our study conducted data analysis with Microsoft Excel software as well.

### **3 Results and Discussion**

Several issues in the EU pharmaceutical firms are identified in the systematic literature study, including the patent system, R&D, healthcare systems,

outsourcing and alliances, and supply chain management. Each segment's results and discussion sectors have been segregated to better grasp the main problem.

### **3.1 To specify the weakness of EU pharmaceutical patent system**

The goal of WTO (2006) paper is to take note of the provisions of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) that pertain to the patent standards to be applied to pharmaceutical innovations. Patent rights are not absolute under the TRIPS Agreement and can be subject to limitations or exceptions. There can be categorised in four major issues, such as: Many EU countries authorize third parties to use a patented innovation for research purposes with the goal of better understanding the invention as a foundation for science and technological advancement. Without the permission of the patent owner, members can permit usage by third parties (compulsory licensing) or for public non-commercial reasons (government use). The Agreement recognizes members' right to adopt anticompetitive measures in accordance with its rules and offers more flexible circumstances for the granting of compulsory licenses. The TRIPS Agreement makes it clear that WTO members' practices regarding the exhaustion of intellectual property rights (e.g., a Member's decision to have a national exhaustion regime, in which rights holders can act against parallel imports, or an international exhaustion regime, in which they cannot) are unchallengeable under the WTO dispute settlement system, provided that the TRIPS Agreement is followed.

Table 1: Summary results for the challenges in EU pharmaceutical patent system.

<b>Author (s)</b>	<b>Focused issue</b>	<b>Challenges in the Pharmaceutical Industry in the European Union</b>
WTO (2006)	Patent system	In the transition provisions, there is flexibility, limitations, and exceptions to the rights that are authorized.
(Tuominen, 2011)	Patent system	No obvious legislative in pharmaceutical patents.
(Liu & la Croix, 2015)	Patent system	The European Union takes longer than competitors to obtain a valid patent right.
(Montaña i Mora, 2017)	Patent system	The EU lacked a patent office, and the institutions were unable to enforce patent laws. A Supplementary Protection Certificate ("SPC")

(Garattini & Padula, 2017)	Patent system	Questioned on the existing regulatory system and proposals to overcome.
(Minssen et al., 2019)	Patent system	With counterfeit medications in developing nations, there are a number of barriers that must be overcome.

Source: Authors (2021).

Importantly, (Tuominen , 2011) discussed that there are no clear legislative answers to specifics regarding EU strategic patenting in the pharmaceutical industry and when it becomes an abusive activity. Undoubtedly, it will be a continuous issue among the stakeholders (generics, consumers, and customers) and a widespread demonization of the pharmaceutical business, of which the Commission may be accused in some of its conclusions, is not productive in this regard. This issue goes to be crucial when prior research supports the absence of an institutional framework in EU to establish a robust patent system. According to the Court of Justice of the European Union ("CJEU"), 18 July 2013; cited in (Montañá i Mora, 2017) that the EU and its member states are in an impossible condition as a result of patent law. That was because the EU did not have a patent office and the institutions that would be capable of dealing with such patent security obligations (administrative and judicial authorities of Member States) would no longer be competent.

Therefore, (Garattini & Padula, 2017) proposed three crucial initiatives for the EU pharmaceutical patent system, such as without revolutionizing the whole structure, a drastic reform is expected to create a separate institutional body to handle pharmaceutical patents. Secondly, pharmaceutical patents can be limited to substances that are used for one (or more) declared indications (s). Finally, pharmaceutical patents can only be held for substances that begin a first clinical trial within five years of being granted and in terms of the importance of public health, it is time to rethink the EU regulation. (Minssen et al., 2019) added that a new European Union strategy could boost the availability of legal pharmaceuticals in developing countries, reducing the issue of counterfeit drugs, but there are still many obstacles to overcome. Moreover, patents on drugs assist in the recoupment of costs incurred during the research and development period. Since rivals can quickly replicate a drug's production, drug patents can protect against infringement cases. However, European Union did not issue patents for new medical products until 1980; approved orphan drugs in 2000 and drugs tested on paediatric population in 2007; while the USA, Australia, Japan and Canada were

having patent rights before Europe. Nevertheless, European Union was the first to provide biological marketing exclusively in 2006 (Liu & la Croix, 2015)

### ***3.2 Challenges in EU pharmaceutical R&D investments and expenditures***

On the one hand, pharmaceutical R&D spending is quite expensive, while the risk and uncertainty of accomplishing the output rate is very low. As a result, the R&D system in the sector is fraught with challenges. For example, the EU invests the most on pharmaceutical research and development (Greer, et al., 2014; European Commission, 2020). Downs & Velamuri (2018) accounted the rate is as 15 % revenue of the company. The study of Banerjee & Siebert (2017) and Cowrick et al. (2011) illustrate that at the early stage of a pharmaceutical company, it is tackled by high demand, profit, and technological uncertainties and improving the chances of completing drug development. R&D collaborations established later in the R&D phase are driven less by these delays and more by R&D funding scarcity. While Spain is an example of a country where R&D spending as a percentage of GDP is extremely low. With just 1% of GDP allocated to research and development, Spain ranks 24th out of 30 OECD member countries in terms of R&D investment Desmet et al., (2004). Furthermore, Sieg et al., (2019) investigated the managerial finance challenges companies face when working with an innovation intermediary to solve R&D problems. Researchers explore three managerial challenges (enlisting internal scientists to collaborate with the innovation intermediary, choosing the correct problems, and formulating problems in such a way that they can be solved). Magazzini et al. (2016) emphasized that there is a lack of access to knowledge from project portfolio managers about the effectiveness of different methods in choosing target markets, a lack of knowledge about project R&D costs, and how companies can completely contribute their failed research projects. Leten et al. (2011) added that pharmaceutical R&D investment is unpredictable due to a lack of portfolio management skills.

Table 2: Summary results for the challenges in EU pharmaceutical R&D.

<b>Author/s</b>	<b>Challenges in the Pharmaceutical Industry in the European Union</b>	<b>Focused issues</b>
(Brusoni & Geuna, 2003)	R&D	Absence of basic research in pharmaceutical studies
(Desmet et al., 2004)	R&D	Spain allocated only 1% of GDP to R&D and too little attention is paid to the R&D's actual execution or implementation.
(Leten et al., 2011)	R&D	Pharmaceutical R&D investment is unpredictable due to a lack of portfolio management skills.
(Cowrick et al., 2011)	R&D	Uncertainties and risks are particularly in the early stages of pharmaceutical development.
(Chaudhuri, 2013)	R&D	In the manufacturing process, generic pharmaceutical products face significant obstacles.
(Magazzini et al., 2016)	R&D	Project portfolio managers' lack of knowledge of the efficacy of various strategies.
(Banerjee & Siebert, 2017)	R&D	High uncertainty and low likelihood of success in passing pharma research phases and frequently having R&D funding scarcity.
(Downs & Velamuri, 2018)	R&D	The pharmaceutical spends around 15 % of the total revenue on research and development (R&D) in the world but considerable uncertainty in output.
(Sieg et al., 2019)	R&D	Managerial challenges companies face when working with an innovation intermediary to solve R&D problems.
(OECD, E.U. 2020)	R&D	High rate of investment in pharma industries in EU countries.
(European Commission, 2020; Greer, et al. 2014).	R&D	European pharmaceutical industry is a major contributor to the investment in innovation.

Source: Authors (2021).

Some studies have raised concerns about the use of R&D design in the pharmaceutical industry, such as Chaudhuri (2013) examined that generic pharmaceutical product production presents specific challenges, and businesses must develop a well-designed method to minimize development costs and time while maintaining product quality. (Desmet et al., 2004) used the detailed firm-level data, Spain's National Pharmaceutical Research Program focuses more on design than implementation. The result indicates that excessive attention might be paid to analysing the design's optimality or concerning more on the achievement of the objectives. At the same time, too little attention is paid to the design's actual execution or implementation. Even if the selection criteria are ideal, the plan will fail if it is not implemented correctly.

### ***3.3 Challenges in EU pharmaceutical alliances, health care system, and others***

There are other literatures concerning the alliances and outsourcing among pharmaceutical firms. Alliances among large and small firms are typical in the pharma industry and the advantages of outsourcing R&D include, such as the outsourcing company may have more experience, the business may have a labor shortage, outsourced R&D may be less costly, and it may mean a quicker time to market for a product or service (cited in Inc.com, 2009). Business leaders most often outsource R&D for component development, construction, new process innovation, new product innovation, and software design. The institutions that outsource R&D work to businesses are universities, government laboratories, independent R&D organizations, suppliers, and other companies. Kneller (2003) paper argued either a drug development process would be in house or at a university is a debate in the pharmaceutical production process. Howells et al. (2008) mentioned several obstacles to the agreement on alliances. Mukhtar (1996) paper suggested that technology-based small firms are dominated by large partner companies.

Table 3. Summary results for other challenges in EU pharmaceutical industry

<b>Author/s</b>	<b>Challenges in the Pharmaceutical Industry in the European Union</b>	<b>Focused issues</b>
(Mukhtar, 1996)	Outsourcing or alliances	Technology-Based Small Firms are dominated by large partner companies.
(Kneller, 2003)	Outsourcing or alliances	A drug discovery debate would be held in the house or at a university.
(Howells et al., 2008)	Outsourcing or alliances	The obstacles to outsourcing agreements
(Fernald et al., 2015)	Outsourcing or alliances	Not enough to compensate for a shortage of pharmaceutical innovation.
(Hu et al., 2017)	Outsourcing alliances	Fraught with challenges that frequently lead to project cancellations or delays in new drug production.
(Kousi et al., 2021)	Health Care System	The Greek health care system has suffered as a result of the economic downturn, the refugee crisis, and the Covid-19 outbreak.
(Rechel et al., 2013)	Health Care System	The demographic reasons like the aging of Europe's population poses additional problems to health, long-term care, and social systems.
Haseeb & Bashir, 2020)	Health Care System	Physicians and patients encounter challenges in receiving proper treatment.
(Sarkis, et Al. 2021)	Supply chain management	Emerging Challenges in Pharmaceutical Manufacturing and Distribution

Source: Authors (2021)

The Global Health Summit of G20 Nations at Rome (2021) addresses that in the sense of a sustainable and inclusive recovery, with investments in health, preparedness and response, and policies guided by scientific advice, coordinate pharmaceutical and nonpharmaceutical interventions and emergency response (including online coordination of crisis and operation centres). Policies can help to accelerate progress toward the SDGs, combat the root causes of health crises, such as social determinants of health, poverty, systemic injustice, and environmental degradation, develop human capital, accelerate green and digital

transformation, and boost prosperity for all. According to European Commission (2020), EU Pharma sector is facing several challenges, such as unavailability of innovative therapies or medicines to all EU patients, equally less efficiency in responding a crisis-resistant system, more ageing population with higher demand, the cost of medicine is often unbearable for patients and EU is increasingly dependent on Non-EU medicine and raw materials import. Due to the lack of a robust pharmaceutical business infrastructure, these problems became even more acute during the covid-19 pandemic. As a result, it is important for the EU pharmaceutical industry to look for any potential problems ahead of time. It is required to consider the weaknesses exposed by the covid-19 pandemic and challenges the pharma industry has before, and it needs to take appropriate actions to strengthen the system.

#### **4 Conclusion**

This study examined the role of challenges in the pharmaceutical industry in the context of European Union (EU). Our study reviewed 27 peer-reviewed articles on the relevant rare phenomenon. Interestingly, this study found numerous issues such as patent systems, R&D, healthcare systems, outsourcing and alliances, and supply chain management. Theoretically, this study contributes to the body of knowledge to address an imperative issue in the pharmaceutical industry, which is rarely researched in the context of EU. Practically, this study provides new useful insights to policymakers, global leaders, and managers to devise policies to achieve performance-oriented culture in their institutions and firms. Finally, this study suggests that future research may explore the challenges of multi-sectoral and cross-country perspectives to get a better understanding and for the long-term sustainability of public pharmaceutical spending, new models of enhancing research investments are needed, and the EU can still play a leading role in its tradition structure within capturing innovative ideas.

### Abstract

Our study reviews scientific papers that have been published in high-quality journals on supply chain resilience (SCR) with regard to the latest developments registered in this field in the pre- and post-Covid-19 era. Adopting a rigorous method for review, i.e., systematic literature review (SLR), our work is a snapshot of the preliminary results of a broader analysis on the available literature on this topic. Although studies on SCR have been widespread for at least twenty years, our findings show that scholars' interest in SCR has been boosted by the pandemic period led by SARS-CoV-2, with publications on SCR nearly doubled in 2021 from the previous year. The preliminary thematic content analysis of our review showed three principal macro-pillars in SCR domain that are worth of further investigations. We also discuss what are, according to our review, the principal gaps in these sub-topics that offer avenues for future research. We ascertain that the main issue these three topics have in common is the fact that unitarian views of the phenomena are actually missing or very underexplored, while single-perspective studies are more frequent. Finally, conclusions and limitations of the study are discussed at the end of the paper.

**Keywords** – supply chain resilience, systematic literature review, supply chain disruption, business continuity

**Paper type** – Academic Research Paper

## 1 Introduction

After the beginning of Covid-19 pandemic, several organizations have faced the important challenge of improving the resilience of their global value and supply chain (GVSC) to optimize operations; to guarantee the quality of outputs and an omni-channel seamless management; to ensure the sustainability of processes; to redesign the supply network; to update knowledge and capabilities etc. (Ivanov, 2018; Ivanov and Dolgui, 2019; Rossi, 2019; Faggioni, 2019). Although supply chain resilience (SCR) is not a new term in the managerial lexicon (Christopher and Peck, 2004; Sheffi and Rice, 2005), it is undoubted that after the recent pandemic SCR has become one of the major issues for supply chain managers that are now extremely committed in searching solutions to guarantee high level of resiliency for their supply chains (Bak *et al.*, 2020). Over the years, several definitions have been addressed for SCR. For example, Christopher and Peck (2004, p. 2) pointed out that SCR is *"the ability of a system to return to its original state or move to a new, more desirable state after being disturbed"*. Ponomarov and Halcomb (2009, p. 131) defined SCR as *"the supply chain adaptation capability to prepare for unexpected events, respond to interruptions, and recover from them to maintain continuity of operations at the desired level of connection and control over the structure and function"*. In essence, SCR is seen by scholars as the capability of a company to guarantee a business continuity (BC) to its operations and activities, increasing its effectiveness in disruptions absorption and diminishing the time-to-recovery, i.e., the time necessary to recover after a disruptive negative event (Kamalahmadi and Parast, 2016). However, despite these general definitions, there is agreement among authors that current definitions of SCR are rather vague and may easily lead to misconceptions among practitioners and researchers; then, further literature reviews could be useful to better understand the nature and the characteristics of SCR (Katsaliaki *et al.*, 2021).

As said, to overcome the above-mentioned issues related to SCR field of research, we believe that a systematic literature review (SLR) of the current state-of-the-art is needed to shed more light on the topic. Even if we are aware that other review papers have been published in the last years, many of them are non-systematic reviews and/or are related to very specific firms/markets aspects (e.g., on SMEs, like in the valuable work of Bak *et al.*, 2021), while a more comprehensive and holistic view on this thematic is currently missing and

therefore needed. In addition, in the last two years Covid-19 pandemic has enhanced the importance of being resilient for GVSC, as it has been acknowledged as one of the most impactful disruption of the last decades (e.g., BCI, 2021). In fact, Covid-19 has not only led firms to a “new normal” to which they have necessarily adapt, but it will also have significant disruption tails for GVSC (Ivanov, 2021). The complexity of achieving resilience for GVSC lies also in the nature of the latter, as they switched from a “linear” configuration to a more “reticular” (i.e., network) one in the last decades, *“which advocate horizontal and vertical collaborations based on the interconnection of the existing logistics networks for sharing the logistics resources and services involved”* (Pan *et al.*, 2021, p. 1). These interoperability and interconnectivity transformations in GVSC networks, together with Covid-19 well-known consequences, are another strong rationale for our investigation and for choosing a specific and rigorous methodology such as the SLR. This is also due to the fact that pandemic is not over yet (i.e., in June 2021) and new worrying Covid-19-related issues are still threatening social and business environments (e.g., Delta coronavirus variant, that ECDC estimates to be the cause of the 90% of future Covid-19 contagions in Europe by the end of August 2021 – ECDC, 2021) (Pujawan and Bah, 2021). In essence, major disruptions like Covid-19 spreads their effects all over the GVSC interconnected network and causes a significant ripple effect (Ivanov *et al.*, 2014; 2021; Ho *et al.*, 2015; Faggioni, 2019; Katsaliaki *et al.*, 2021) all along the chain. This effect encouraged scholars and practitioners to make new and deeper efforts to understand how firms resilience strategies have changed in the pre- and post-Covid-19 era (Deloitte, 2020; Zhu *et al.*, 2020). To this end, with the preliminary results of our SLR we aim to achieve two major objectives:

1. Documenting, synthesising and summarising the existing research-informed studies in SCR research in the pre- and post-Covid-19 era (2018-2021);
2. Identifying those areas of SCR research which need scholars’ further development, as well as providing recommendations for future research.

The remainder of the paper is organized as follows. The second section discusses the adopted methodology and turns our research objectives into the form of specific research questions that we aim to satisfy. The third section is dedicated to the preliminary analysis of the findings emerged from the descriptive and thematic content analysis of the related papers, focusing on the

main sub-research fields and on the emerging research gaps. The last section discusses the findings of this study among with its limitations.

## 2 Methodology and research questions

To undertake the SLR we chose to conduct an extensive search on the principal management literature search engines to which we had access through our Institution. In particular, we used ScienceDirect, Emerald, EBSCO Business Source Complete, Google Scholar, and ResearchGate databases for our keyword search and to collect articles. The search began in February 2021 and ended on the end of May 2021 due to the deadline for full paper submission fixed by IFKAD 2021 Conference by the end of June 2021, in order to have at least one month to analyse our results.

For our analysis, we adopted the 7-stages approach proposed by Fan and Stevenson (2018), that consists in the following steps: *questions formulation, keyword search in identified databases, removal of duplicates, article quality and relevance assessment, capturing other relevant articles, full-text analysis, reporting*. We searched for articles published in high-quality journals from 2018 and 2021 (i.e., pre- and post-pandemic era) to compare how research on SCR has changed with the paradigm shift led by Covid-19 and to highlight what are the major themes and challenges that managers have to face to make their companies to survive and to gain new competitive advantages in this disruptive period of change. That said, our research questions are the following:

*RQ<sub>1</sub>: What is the state-of-the-art in SCR research and how have the scholars changed their approach to this topic after Covid-19 pandemic?*

*RQ<sub>2</sub>: What are the major gaps arising from the existing SCR literature and which areas of research should scholars address first?*

To define specific RQs is essential to provide valuable results from a SLR and "to enable the researcher both to map and to assess the existing intellectual territory, and to specify a research question to develop the existing body of knowledge further" (Tranfield et al., 2003, p. 208).

Regarding the keywords search phase, we followed the approach of Ho et al. (2015) that suggested to use broad terms to be sure not to miss relevant papers that may not being correctly indexed by the search engines. Thus, we used the following strings of research: "supply chain resilience", "supply chain" AND "resilience". After a first search that led us to find 2,355 articles for the selected

time span (2018-2021), we made an exception to our searching protocol including also papers founded by typing "business continuity" and "business resilience" as keywords as they are often used as synonyms for SCR. After this second search, 353 new papers were found. In total, we collected 2,708 scientific papers on the topic in the considered period. Then, all the papers have been analysed for a first screening by authors to remove all the duplicates and to understand, on the basis of the contents included in titles and abstracts of papers, if they were actually treating the topic of interest. After the screening, more than 50% of papers were excluded from the SLR because of their different scope or because their typologies were different from journals' articles (conference papers, working papers, thesis, PhD dissertations, books, managerial literature etc.). To address the quality of the remainder set of papers, we choose to include in the final set only papers published in journals with an impact factor (IF) higher than or equal to 2.66, as this value is considered a very good IF for "Business, Management, and Accounting" journal category according to Sci Journal (2018) ranking. This second screening resulted in a final set of 189 papers, that were consequently included in the review process to answer to the RQs.

The final set was subsequently analysed for the full-text analysis stage of research methodology, the results of which are then presented in the next section dedicated to findings in the form of a descriptive and thematic content analysis. Before we continue, we synthetize in Figure 1 (see next page) all the stages that composed our methodology to facilitate the understanding of the overall process.

### **3 Findings**

For reasons of space, findings are briefly presented in the following sub-paragraphs, as this article has the sole objective to show the preliminary results of a more extensive systematic and structured literature review.

#### **3.1 Descriptive analysis**

Descriptive analysis helps us to understand what are the general trends in literature on the focal topic of this paper. Out of the 189 analysed papers, 28 (14,8%) have been published in 2018, 41 (21,7%) in 2019, and 45 (23,8%) in 2020. Accordingly, papers published in 2021 are in total 75 (39,7%). As it is immediately clear, interest in SCR by scholars has increased by the years, with a significant acceleration in 2021. This is not surprisingly, as papers published in 2021 have

likely been submitted for review to scientific journals in 2020, i.e., the year of Covid-19 advent.

<p><b>1) RQs formulation</b></p> <p>RQ1: <i>What is the state-of-the-art in SCR research and how have the scholars changed their approach to this topic after Covid-19 pandemic?</i></p> <p>RQ2: <i>What are the major gaps arising from the existing SCR literature and which areas of research should scholars address first?</i></p>
<p><b>2) Keyword search 3) Removal of duplicates 4) Quality assessment</b></p> <p><i>Keywords:</i> «supply chain resilience» and «supply chain» AND «resilience»</p> <p><i>Additional search:</i> «business continuity» and «business resilience»</p> <p><i>Initial set of papers:</i> 2,708</p> <p><i>Inclusion criteria:</i> only papers published in journals with an IF higher or equal to 2.66 between 2018 and 2021</p>
<p><b>5) Capturing other relevant articles 6) Full-text analysis 7) Reporting</b></p> <p>After searching for other relevant papers, a final set of 189 papers has been chosen for full-text analysis, that will led to:</p> <ul style="list-style-type: none"> <li>- <i>Descriptive analysis</i></li> <li>- <i>Thematic content analysis</i></li> </ul>

*Figure 1: Synthetic overview of the 7-stages research methodology process*  
*Source: Self elaboration*

So, a quick look to this general trend partially answers to the first RQ, showing a significant growing interest from researchers for this topic after the beginning of the pandemic period if compared to the previous years, as shown in Figure 2 and in Figure 3.

Figure 2: Number of articles by journal (first 15 journals by number of published papers on SCR between 2018 and 2021)  
Source: Self elaboration

Figure 3: Number of articles by year  
Source: Self elaboration

With regard to the most studied industries in our final set of papers, we observed that the most investigated economic sectors are: Food (Ali *et al.*, 2018;

Hendry *et al.*, 2019; Kumar *et al.*, 2021), Automotive and Construction (Gupta *et al.*, 2020; Afraz *et al.*, 2021), Manufacturing and Service (Liu *et al.*, 2018; Belhadi *et al.*, 2021), Fashion and Luxury (Bin Makhashen *et al.*, 2020; Shen *et al.*, 2020; Hsu *et al.*, 2021). In 2021, we found in addition an increased number of publications concerning the SCR of the Vaccine industry, compared to the previous years (Sazvar *et al.*, 2021; Sinha *et al.*, 2021). This result confirms how the attention on SCR has been significantly influenced by Covid-19 pandemic.

Finally, the methodologies that have been used in our final set of papers are both theoretical and empirical, with 19 ( $\approx 10\%$ ) papers conducting systematic and non-systematic literature reviews (Karl *et al.*, 2018; Chowdhury *et al.*, 2021; Al Naimi *et al.*, 2021) and 170 ( $\approx 90\%$ ) empirical papers adopting qualitative, quantitative, and mixed-method approaches (Ali and Gölgeci, 2019; Ahmadian *et al.*, 2020; Gu *et al.*, 2021). It is notable that there is still a huge difference in terms of number between theoretical/review papers and empirical articles (notwithstanding the unquestionable growing interest from researchers both from theoretical and empirical side), confirming our statement in the introduction section in which we observed that deeper efforts from a theoretical/review perspective are currently needed in this field of research.

### **3.2 Thematic content analysis**

From thematic content analysis, we identified three macro-pillars that correspond to the main gaps and principal areas of investigation for future research, namely: *technology*, *risk management and metrics* and *sustainability*. In the remainder of the paragraph, we briefly analysed the main content for each of the pillar.

*Technology.* Technology is by far one of the main issues pointed out by scholars, as it is seen both as a tool to gain resilience (e.g., with the use of blockchain, additive manufacturing and digital twins technologies – Min, 2019; Nandi *et al.*, 2021; Verboeket and Krikke, 2019; Ivanov and Dolgui, 2019) and as an environment in which disruptions may come from either physical and virtual disruptions (e.g., cyber-attacks) (Colicchia *et al.*, 2019). This is a first useful insight since SCR is often treated only as a “physical” phenomenon, that may consequently be affected only by physical and material disruptions. In our review we saw that the “cyber-side” of SCR is very under-investigated, but the rapid

escalation of new digital technologies, artificial intelligence and other robotic innovations should lead researchers to do more in that direction.

*Risk management and metrics.* Significant research has been made by scholars in the field of risk management and metrics for SCR (Fan and Stevenson, 2018; Behzadi *et al.*, 2020). By our review we noted that many papers treated risk management from a single/specific viewpoint (i.e., they look at a specific risk/disruption occurrence and management) without integrate all the SC risk management stages, as remarked in the valuable study by Fan e Stevenson (2018). In this regard, we strongly encourage researchers to do more efforts in including more risk/disruption categories in their future empirical studies, both including physical and digital threats for supply chain (as said for the *technology* pillar). From the metrics point of view, there is a fervent stream of research that aim to understand metrics and KPI for resilience (Karl *et al.*, 2018; Behzadi *et al.*, 2020; Fattahi *et al.*, 2020) but still there is – to the best of our knowledge – an under-explored area of research that consists in identifying metrics capable to synthesize available “traditional” supply chain metrics (e.g., DOH, inventory velocity, warehousing costs etc.).

*Sustainability.* Sustainability, associated to SCR management, is considered a topical thematic by scholars (Nayeri *et al.*, 2021; Flores-Sigenza *et al.*, 2021). Sustainability has been treated by the lens of sustainable performance (Di Vaio and Varriale, 2019), sustainable production and procurement (Kaur *et al.*, 2018), and from ecological and green viewpoints (López and Ruiz-Benítez, 2020). This is the research area of the three above identified in which we found more articles in number and more comprehensive studies, also because, according to some currents of thought in academia, resilience is considered a driver for sustainability (e.g., in the LARG – lean, agile, resilient, green – paradigm, Raut *et al.*, 2020). Similarly to our conclusions on metrics pillar, we believe that further research in this domain must be focused on multi-actor and multi-sector perspectives, in order to verify if the general consensus about current theories in sustainability applied to SCR are sufficiently robust to be generalized regardless of the specific actor/sector of investigation.

#### **4 Conclusions and limitations**

This paper extends prior SCR research by arguing that this topic is an important, yet underexplored thematic in SCM domain and there is a need to

further understand this complex phenomenon especially after the Covid-19 pandemic. Our results showed, from a descriptive view, that scholars are doing significant efforts to better understand the nature and the characteristics of being resilient for a SC, but still there are some sub-domains that need to be addressed as soon as possible to respond to an eventual third wave of Covid-19, that is expected in the following months with the worrying escalation of Delta coronavirus variant contagions in Europe and in the West in general. We have synthesised these further areas of investigation in three macro-pillars (*technology, risk management and metrics, sustainability*), discussing what are, according to our review, the principal gaps in these sub-topics that offer avenues for future research, finding that the main issue these three topics have in common is the fact that unitarian views of the phenomena are actually missing or very under-explored, while single-perspective studies are more frequent in literature.

Limitations of this study can be attributed to its nature, not only because it is a mere theoretical study, but also because these are only the preliminary results of a broader and deeper analysis that we aim to continue in the following months. However, we are sure that scholars and practitioners can benefit from this study, finding tips, recommendations, and ideas to further develop academic and professional studies they conducted until now on SCR.

P.O. Box 20, FI-53851, Finland

### Abstract

In modern-day organizations, managers are expected to rely on business analytics tools and models when making decisions. Business analytics related literature offers various business analytics related capability models that should help organizations to increase the role of data in managerial decision making. However, these models do not seem to take into consideration that the ultimate decision making accountability often lies in the hands of an individual manager, whose task is to select and combine various types of knowledge in order to understand the aspects of different types of decision-making situations, and to come into feasible conclusions in different contexts. To be able to better support their managers and to ensure they can realize the expected value of their business analytics investments, organizations should pay more attention to what kind of knowledge their individual managers use in decision-making situations, and how they use it. With the help of four initial propositions, this paper demonstrates the underlying reasons for individual managers to use various types of knowledge when making decisions, even when they are expected to make data-driven decisions supported by business analytics. Based on these initial propositions, further research ideas are suggested, to help increase the understanding on how different types of knowledge are affiliated into managerial decision making.

**Keywords** – decision making, knowledge management, business analytics

**Paper type** – Academic Research Paper

### 1 Introduction

Fast-paced development of increasingly efficient and effective digital technologies used by individuals and organizations has resulted in having more data available than ever before. For most organizations, it has become obvious to use data from various sources to gain deeper understanding of their external environments and internal operations and to make “data-driven” and “fact-based”

decisions to improve their performance. (Davenport and Harris, 2007; Hindle et al., 2020).

Business analytics is one of the toolsets applied by organizations to generate new knowledge and make better decisions (Pauleen and Wang, 2017; Kudyba, Fjermestad and Davenport, 2020; Lepenioti et al., 2020). The more the analytics capabilities have been developed, the more precise and holistic support the analytics models and tools have been able to provide for decision making; data and information derived with the help of business analytics can be used as input for purely human decisions or fully automated decisions, or for any combination of both. (Davenport, 2018; Lepenioti et al., 2020).

The actual value arising from analytics is often considered to be based on leveraging analytical capabilities that combine human and technological elements (Cosic, Shanks and Maynard, 2012; Gupta and George, 2016; Vidgen, Shaw and Grant, 2017). Through human interaction, also the knowledge created with the help of business analytics becomes embedded into organization's human, relational and structural capital that supports leveraging organization's other assets and resources and thereby forming unique capabilities that are a prerequisite for creating competitive advantage. (Grant, 1996; Spender, 1996; Marr, 2008; Handzig, 2017; Inkinen et al., 2017).

Business analytics related literature has addressed the role of managers as the drivers of business analytics strategies, listing various sets of common managerial capabilities that they should possess to utilize business analytics and to make data-driven decisions (Vidgen, Shaw and Grant, 2017; Chen and Nath, 2018). While organizations and their managers face different types of decisions (March, 1991a; Luoma, 2016), business analytics related capability models (Cosic, Shanks and Maynard, 2012; Gupta and George, 2016) mainly seem to suggest a list of generic capabilities that assumes similar role to business analytics in all managerial decisions

Also, business analytics related capability models seem to assume that all managers approach decision making in a similar manner. Even though managerial decisions are becoming increasingly data-driven, it should not be forgotten that – at least in the “western world” – the accountability for a particular decision often lies with an individual manager (Brown, 1999; Martinsons and Davison, 2007; Brown et al., 2019), and that – besides the data and information acquired with the help of business analytics – these individual managers use also other sources of knowledge, including their personal knowledge and accumulated experience in all

their activities (Gavetti and Levinthal, 2000; Argote and Miron-Spektor, 2011; Csaszar and Levinthal, 2015).

Knowledge in its different forms, originating from different sources is combined and exchanged as part of managerial decision making (Gray, 2001; Choo, 2016). Whereas analytical capabilities and data-driven decision making have been an area of interest for academic researchers in recent years (Mortensen et al., 2015; Hindle et al., 2020), research community seems to put less focus on how the knowledge derived with the help of business analytics interacts with other types of knowledge in decision-making situations, and how this knowledge is leveraged and further developed by managers when making decisions.

Exploring how individual managers acquire and use different types of knowledge when making decisions would help understand the manager's role in data-driven decision making in a modern-day context where decisions are increasingly relying on business analytics tools and models. With this kind of deeper understanding, the organizations could also offer more holistic support for their managers in various decision-making situations, and thereby find new ways to realize the value potential of business analytics.

Using previous literature on managerial decision making and business analytics, this paper establishes a high-level theoretical background for investigating how managers acquire and use different types of knowledge when making decisions. First, managerial decision making and the role of knowledge as part of managerial decision making are explained, and two initial propositions on using different types of knowledge in managerial decision making are made using previous research. After this, the role increasing of business analytics in decision making is discussed. Again, two initial propositions are made based on previous literature. Finally, conclusions are made regarding what has been previously discussed about the role of knowledge in supporting managerial decision making in the context of data-driven organization, and some suggestions for further research activities are introduced.

## **2 Decision making**

### ***2.1 Managerial decision making***

Competitive advantage of an organization depends on what kind of resources it possesses and how these resources are combined and used (Barney, 1991). To

find ways to generate competitive advantage, organizations are continuously required to sense and shape opportunities and threats, select and seize opportunities, and manage, transform, and reconfigure the tangible and intangible assets (Teece, 2007). Organizations have several alternatives they can pursue, and they must decide between these alternatives. Decision makers identify alternatives and approach decisions in terms of their existing resources, referred to as exploitation, or by exploring new possibilities, referred to as exploration, which may also require developing or acquiring new resources. (March, 1991a; Gavetti and Levinthal, 2000).

Organizations face decision making situations that involve exploitation, exploration, or both. Compared with exploitation that aims at identifying and evaluating decision alternatives in terms of the current resources and scope of the organization, exploration requires more effort, as it expands this search outside the organization's existing boundaries to identify new alternatives. As exploitation involves more clarity and certainty from the organization's perspective, it is often preferred at the cost of exploration in mapping strategic alternatives. (March, 1991a; Gavetti and Levinthal, 2000). Organizations can develop and improve their capabilities in terms of both exploitation of existing scope and resources and exploration of new alternatives (March, 1991a; Luoma, 2016).

Individuals working in organizations, including managers, have different decision-making accountabilities depending on their role (Floyd and Lane, 2000). Most managerial roles are involved in decisions regarding daily activities of the organization within the scope of existing resources, hence, exploitation-type of decisions. However, the more responsibilities the manager has, the more likely they are also involved in decision activities that include novel aspects, require exploring new alternatives or may even result in redefining the scope of the work for managers on other levels of the organization (Noda and Bower, 1996; Courtney, 2001).

Routine-type, repetitive decisions are sometimes referred to as "programmed", as they are relatively easy to define, and potential solutions are easily identifiable. Organizations can establish processes for making these decisions, and for example decision automation is based on this idea. (Simon and Norton, 1960; Choo, 1996; Davenport and Harris, 2005) However, organizations also face decisions that may include such a level of complexity as well as elements of uniqueness or novelty that they cannot be easily structured and can be viewed as "non-programmed". (Simon and Norton, 1960; Cyert and March, 1992; Courtney,

2001). Different types of decisions benefit from different types of approaches, and the tools, models and methods that are feasible for supporting routine decisions may differ from those needed for solving complex and somewhat unique problems. (Simon and Norton, 1960; Cyert and March, 1992; Luoma, 2016; Kunc and O'Brien, 2019).

In strategic management and operational research related literature, decision making involving non-programmed decisions is often described as problem-solving: when an event occurs (problem is identified), it is first analyzed to form an understanding of its quality, scope and context (classification, structuring and definition of the problem) before it can be thoroughly modelled and analyzed to identify potential solutions and to make recommendations for the decision. After the decisions are made, they are implemented, and the outcomes are monitored and evaluated. (Simon and Norton, 1960; Courtney, 2001; Krajewski, Ritzman and Malhotra, 2007). This kind of "problem-solving/decision-making" process is of an iterative nature and can utilize a quantitative or a qualitative approach, or a combination of both. (Simon and Norton, 1960; March, 1991a, 1991b; Cyert and March, 1992; Winter, 2003; Anderson et al., 2009).

## ***2.2 Role of knowledge in managerial decision making***

Knowledge as an organizational asset manifests through organization's human, relational and structural capital. It is essential for leveraging organization's other assets and resources for developing valuable and rare capabilities that are required for creating competitive advantage (Grant, 1996; Spender, 1996; Marr 2008; Handzig, 2017; Inkien et al., 2017).

The role of knowledge in "problem-solving/decision-making" activities is often linked to knowledge creation, learning and accumulating experience. As part of decision making, organizations utilize various knowledge assets within and outside the organization to support decision making (Courtney, 2001). Combining and exchanging knowledge creates new knowledge and intellectual capital for the organization (Nahapiet and Ghoshal, 1998). Individual managers contribute their knowledge into the "problem-solving/decision-making" process and use it to interpret and combine the new knowledge they receive in return. Managers also learn through this experience, and this experiential learning accumulates their knowledge. (March, 1991b; Nonaka, Toyama and Konno, 2000; Easterby-Smith and Prieto, 2008; Argote and Miron-Spektor, 2011).

Accumulated knowledge and experience are at the core of decision making situations involving exploitation of existing resources, as this approach mainly seeks for solutions among what already exists (Gavetti and Levinthal, 2000). As the scope and context are more familiar, experience accumulating through decision making may also bring a certain routine to such decisions (Luoma, 2016).

Exploration requires more forward-looking intelligence, including making new assumptions and connections based on beliefs rather than experience. This kind of cognitive search of solutions takes more time and effort than the search that relies on prior experience. (Gavetti and Levinthal, 2000). On the other hand, cognitive and forward-looking search may result in a larger variety of decision alternatives or even redefining the scope of the original decision. (Gavetti and Levinthal, 2000; Csaszar and Levinthal, 2015). From knowledge management perspective, exploration and exploitation seem to require somewhat different approaches regarding knowledge creation and utilization, as exploration assumes viewing the situation from a broader perspective than the exploitation (Gray, 2001). To summarize the role of knowledge in managerial decision making, Proposition 1 is presented:

*Proposition 1: When making decisions, managers use different types of knowledge in different ways depending on whether the problem-solving/decision-making process involves exploratory vs exploitative elements.*

In addition to different types of decisions, decision making research also discusses various aspects that may limit organizations from finding a satisfying solution for identified problems. These aspects vary from contextual/situational factors (e.g., availability of information, availability of time, complexity of the decision and its context) to cognitive and psychological factors that affect the decision makers' perception and behaviour (e.g., logic of appropriateness, absorptive capacity, temporal orders, and – in general - cognitive systems). (Simon and Norton, 1960; Tversky & Kahneman, 1986; Simon, 1987, March, 1991b; March, 1994; Raiffa, 2002; Kahneman, 2003).

Accumulated knowledge and experience may generate cognitive limitations for decision making. Prior experience and knowledge may help save time and make more realistic decisions, but the accumulated experience of both the individuals and the organizations also limits problem solving and decision making situations, as it tends to steer the identification of problems and search of potential solutions into areas that are already more familiar to decision-makers (March,

1991a; Ocasio, 1997; Gavetti and Levinthal, 2000). This kind of limiting aspect is present in decisions that require exploitation but also in decisions that require exploration: in both situations, decision makers tend to define the scope of the problem/decision based on their existing mental representations that result from their prior experience, and then search for the potential alternatives based on that scope, potentially leaving out those alternatives that do not fit into their understanding of the world (Csaszar & Levinthal, 2015). Based on this, the following can be proposed:

*Proposition 2: Managers' prior experience impacts on what kind of knowledge they use when making decisions, and how they use this knowledge.*

As discussed in this chapter, it seems that that managers face various types of decision-making situations that require using different types of knowledge, and managers themselves define what type of knowledge is needed when making decisions. While these two aspects address potential reasons for managers for using different types of knowledge in decision-making situations, also the potential role of business analytics needs to be considered in order to estimate its impact on the types of knowledge used by managers when making decisions.

### **3 Business analytics**

#### **3.1 Increasing role of business analytics in decision making**

Organizations have more data and more computing power available than ever before. Business analytics and analytical capabilities are considered an important source of competitiveness for organizations, and this view has been growing stronger as the use of analytics systems has increased in organizations (Vidgen, Shaw and Grant, 2017; Lepenioti et al., 2020). "Business analytics" or "analytics" refers to a combination of data (sometimes described as "big data"), analytical tools, and descriptive, predictive and prescriptive models that organizations use to support their decision-making and action planning (Hindle et al., 2020). The data used in business analytics can originate from various kinds of intra- and extra-organizational sources, and the tools and approaches for analyzing this data are mainly based on statistical or other mathematical methods, such as simulation, evolutionary computation, or machine learning. (Davenport and Harris, 2007; Vidgen, Shaw and Grant, 2017; Hindle et al., 2020)

Analytical methods and models have developed significantly in the past decade. The first implementations of business analytics were mostly based descriptive models, finding patterns from historical or current data to identify potential problems or opportunities. Since then, using statistical analytics, probabilistic modeling and machine learning to create predictive models to forecast alternative futures has become increasingly common. (Lepenioti et al., 2020). During the past years, the increased computing power together with the flexible cloud-based environments have enabled to take these models even further. This area of business analytics, prescriptive modeling, involves building “networks of models” that aim at creating decision recommendations by simulating various circumstances and potential events, and even how the logics between the elements within the network would be impacted in case some of the inputs, algorithms, or rules would be changed. In theory, prescriptive models would help organizations in making decisions already by predicting them before the need for decision making even arises. (Praseeda and Shivakumar, 2014; Van Rijmenam et al., 2019; Lepenioti et al., 2020).

As the role of business analytics in decision making increases, organizations are expected to become more “data-driven” and discontinue making decisions that cannot be backed up with data. Data-driven decision making is considered to outplay the more “traditional”, experience and expertise-based decision-making approach, as it offers a faster and more “fact-based” approach. (Van Rijmenam et al., 2019; Lepenioti et al., 2020). Increasing amount of decisions that were once considered to be non-programmed are benefitting from the increased availability of data, improved computational capacity and development analytics methods and models, to the extent that they can be extensively supported with decision automation (Davenport and Harris, 2005; Burkart, Robert and Hubert, 2021). Regarding those decisions that continue having more non-programmed nature in this new context, the amount and quality of methods and tools that can be used for simulating cognitive search of different decision alternatives, testing different scenarios, and evaluating their outcomes using different models and parameters has increased dramatically (Luoma, 2016; Lepenioti et al., 2020). The more experience the organization accumulates when it supports decision making with business analytics, the more it can leverage the value of analytics. (Davenport, 2018; Van Rijmenam et al., 2019; Lepenioti et al., 2020).

Organization’s ability to realize the value potential of business analytics is considered to depend on its ability to develop and establish analytical capabilities

that combine human and technological elements (Vidgen, Shaw and Grant, 2017; Chen & Nath, 2018). While technological and modeling capabilities help organizations to improve their data quality and to generate information based on this data, the various business analytics capability models also mention organization, culture, processes, people and business analytics strategy as crucial elements for realizing the potential value from analytics (Davenport and Harris, 2007; Cosic et al., 2012; Gupta and George, 2016; Lin, Kunnathur and Long, 2020). Based on this, it can be proposed that

*Proposition 3: The maturity level of organization's business analytics capabilities impacts on how managers balance the use of business analytics vs. other sources of knowledge their decision making.*

### **3.2 Limitations of data-driven decision making**

In business analytics literature, data-driven decision making and utilizing business analytics is often contrasted with human decision making that relies more on experience and intuition. Decision making is considered to be more rational and fact-based when it is supported by business analytics, as human decision making is limited by various aspects (as discussed in chapter 2.2.). (Van Rijmenam et al., 2019; Lepenioti et al., 2020). However, data-driven decision making also contains some limitations that deserve attention.

First, as in all decision making, also the success and quality of data-driven decision making depend on contextual factors, such as data and information available for the analysis, or the complexity of the decision (Simon, 1987; March, 1994; Vidgen, Shaw & Grant, 2017). Even though data processing capability of business analytics solutions may outplay human processing capabilities, these solutions are not necessarily able to pull together all possible data, information and knowledge that may be required for decision making. Trusting too much on business analytics solutions to process all the feasible data and information, and to do it with the "best possible" approach and algorithmic structure considering the decision at hand may bound decision-making processes and create a false impression that all the alternatives and their outcomes are covered within the process. (Pachidi and Huysman, 2018; Kunc and O'Brien, 2019).

Another factor impacting decision making are the cognitive limitations of decision makers (March, 1991b; Kahneman, 2003). While business analytics systems themselves lack certain human aspects, they are created and used by

people. Numerous human decisions are made constantly to choose between various alternatives regarding the implementation and use of each component of the business analytics capability. (Pauleen and Wang, 2017; Vidgen, Shaw and Grant, 2017). This means that the limitations embedded into human knowledge and capabilities are built into business analytics systems and models, and that these limitations impact on how they function and how they are used. (Simon and Newell, 1958; Simon, 1987).

Also, the more complex the decision, the more judgment is needed for defining what aspects should be considered and evaluated as part of the decision. Whereas an organization can utilize its existing knowledge, information and data to create a digital model of its existing business in terms of scope and resources and use this as a basis for evaluating different scenarios, more assumptions are required to be made regarding the analytics models, as the level of novelty and complexity of the decision making situation increases (Luoma, 2016).

Decision making responsibility does not lie with the analytics solution but rather with managers, and the role of business analytics in different decision-making situations needs to be decided by human decision makers. Hence, it is the individual decision maker who makes the final choice on how much they rely on the support from business analytics when making strategic decisions. (Kunc and O'Brien, 2019). This leads to the following proposition:

*Proposition 4: The level of complexity of the decision-making situation at hand impacts how managers balance the use of business analytics vs. other sources of knowledge when making decisions.*

Propositions 3 and 4 provide additional aspects on using different types of knowledge in managerial decision making, suggesting that business analytics capabilities and the nature of decision define how managers use different sources of knowledge. Next chapter discusses how these propositions, together with the other two other initial propositions, should be viewed in terms of the role of knowledge in managerial decision making, and how the research work should be continued.

## **4 Conclusions**

Knowledge exists within individuals and organizations, and organizations use knowledge from different intra- and extra-organizational sources when making decisions (Gray, 2001; Courtney, 2001). As part of this process as well as other

interaction the individual managers are engaged in, new knowledge is created (Cook and Brown, 1999; Nonaka et al., 2000; Easterby-Smith and Prieto, 2008).

Business analytics is one of the tools to help organizations generate new knowledge (Pauleen & Wang, 2017; Kudyba, Fjermestad and Davenport, 2020). Organizations can use this knowledge to make more data-driven decisions that help them generate more business value. To realize this value, organizations need to build adequate business analytics related capabilities (Hindle et al., 2020).

In business analytics literature, the role of decision-making managers has mainly been discussed in terms of analytics capabilities they should possess in order to make data-driven decisions and to create business analytics strategies (Vidgen, Shaw and Grant, 2017; Chen and Nath, 2018). These capabilities are mainly described on generic level, assuming similar roles to all managers and making no difference between different types of decisions (Cosic, Shanks and Maynard, 2012; Gupta and George, 2016). However, individual managers face various types of decisions that require different types of approach and knowledge (March, 1991a; Gavetti and Levinthal, 2000).

Based on previous literature, this paper introduces four initial propositions that discuss the potential factors that may impact on how individual managers use different types of knowledge in decision making situations. It is proposed that the nature of the decision at hand as well as individual manager's prior experience impact on what kind of knowledge they use and how they use it in decision-making situations (Propositions 1 and 2). Additionally, it is proposed that the business analytics capabilities that are available for managers and the complexity of the decision at hand impact on how managers balance the use of business analytics vs. other sources of knowledge when making decisions (Propositions 3 and 4).

While the four initial propositions serve as indicators about the presence of different types of knowledge in managerial decision making, combining previous research from different fields, mainly knowledge management, operational research, and business analytics requires more analysis than what has been prepared for this paper. A structured literature review should be conducted to further detail the theoretical background and the initial propositions presented here.

Also, the four initial propositions discuss the potential contextual factors that may impact on how different types of knowledge are affiliated in managerial decision making. However, they do not provide much clarification on what kind of

knowledge managers use when making decisions, and how they use it. Thereby, further research is also required to develop deeper understanding on how individual managers approach data, information, and knowledge as part of their decision-making activities.

Future research should investigate decision-making in the context of data-driven organizations by answering the research question [RQ]: "How are different types of knowledge affiliated to managerial decision making?". This question should be supported by two relatively wide sub-questions. The first sub-question [SQ1] should be answered to create a connection between different types of knowledge and managerial decision making: "What kind of knowledge managers use when making decisions?". The second sub-question [SQ2] is required to form a deeper understanding on the role of knowledge as part of decision making processes and practices: "How do managers use different types of knowledge when making decisions?"

Besides more in-depth theoretical research, empirical investigation would support testing the research assumptions and propositions in practice and developing deeper understanding on how managers themselves would describe the role of knowledge in various decision making situations.

Theoretical contribution of such future research would include building bridges between three different fields: knowledge management, operational research, and business analytics. It should also aim at providing additional understanding of the role of different types of knowledge in a data-driven context and offering new insight into the role of human actor, in this case, the manager, in various decision making situations. Using the results of such research, also individual organizations could better understand how to realize the value potential of their decision making capabilities and how to ensure business analytics capabilities become an essential component within their intellectual capital.

### **Abstract**

Hospital providers are facing unprecedented challenges such as ambitious sustainability targets while remaining resilient to adverse events, e.g. COVID-19. However, instead of leveraging the collective knowledge of all UK National Health Service (NHS) hospital providers, Hospital Estates and Facilities Management (HEFM) departments have to resort to using their own resources to find guidance and innovative solutions to their safety-critical infrastructure issues.

This exploratory study draws upon academic studies from four domains: the institutional complexity of public healthcare systems, facilities management (FM), the ability to effectively manage change and inter-organisational knowledge sharing (KS). Various studies have stressed the lack of effective KS among NHS HEFM departments. However, so far, research studies exploring KS barriers and channels have either focused on KS among clinical disciplines or on FM organisations unaffected by the complexity of healthcare systems. Therefore, this paper develops a theoretical framework illustrating the underlying concepts and addresses the following question: What KS barriers and channels exist among NHS HEFM departments?

Due to the complexity of the UK healthcare system, a complete understanding of the environment is needed before being able to understand the system itself. A systems approach is adopted, utilising mixed methods to study the dysfunctions of the existing system by understanding the interactions on multiple levels and identifying barriers to KS. The research incorporates a thorough review and analysis of the literature and 12 exploratory qualitative interviews with healthcare stakeholders and academic experts.

The findings uncover a multitude of barriers throughout the KS process. Continuous structural reorganisations of the NHS, silo-thinking, inter-hospital competition, a lack of

investment in professional development and additional complexities due to different ownership and service outsourcing models create a challenging environment for effective inter-organisational KS. Regarding KS channels, the NHS is still lacking a holistic strategy through which different types of documented and undocumented knowledge can be shared.

## 1 Introduction

Hospitals are facing unprecedented challenges as the COVID-19 pandemic threatens the capacity and resilience of the workforce and infrastructure. However, the current pandemic is only one of many demanding challenges for the healthcare sector. Others include new care models, continuous economic burdens and a net-zero carbon target by 2040 which are forcing hospitals to operate resource-efficiently while preserving resilience to adverse events. In the recent publication of the UK report *Delivering a "Net Zero" National Health Service*, the NHS ambitiously sets the goal to be the world's first carbon-neutral health system by 2040 (Jennings and Rao, 2020), requiring a "wide range of interventions focused on air conditioning and cooling, ventilation [...]" (NHS England and Improvement, 2020). Additionally, the COVID-19 pandemic uncovered capacity limits – as seen with the medical oxygen infrastructure (Booth and Campbell, 2020) – and complex challenges such as virus transmission routes in hospitals necessitating process adaptations.

Hospital estates and facilities management (HEFM) departments are responsible for maintaining safety-critical infrastructure and essential support services. Therefore, HEFM departments need to be able to manage changes – regardless of whether they are caused by external stressors or internal initiatives. Successes and failures are valuable experiences in the process of managing change. However, rather than only passively accumulating experience, HEFM staff need to derive lessons learned which can be shared with other HEFM departments facing similar challenges. Hence, effective knowledge sharing (KS) activities across the NHS are required (AHSN Network, 2019). However, currently, individual HEFM departments have to resort to using their own resources to find guidance and innovative solutions to their safety-critical infrastructure issues.

Hence, this paper aims to explore the role of KS among NHS HEFM departments in enhancing the ability to manage changes faced by hospitals.

The paper is structured as follows. Firstly, we explore relevant literature domains, illustrate key concepts in a theoretical framework, and summarise findings from previous research studies. Then, we review the methods that were used to collect, analyse, and present data for the research. Finally, we present and discuss the collected data in light of previous studies and conclude by outlining academic and practical contributions, acknowledging the limitations of this study and highlighting further research opportunities.

## **2 Literature review**

This research is positioned within four areas of knowledge: complexity of public healthcare systems, facilities management, managing change and knowledge sharing.

### ***2.1 Complexity of healthcare systems***

To provide a common understanding of health systems, the WHO published a framework that identifies six building blocks: (i) health workforce; (ii) information systems; (iii) technologies and infrastructure; (iv) service delivery; (v) leadership and governance; and (vi) financing. The four major system goals are improved health and health equity, responsiveness, social and financial risk protection, and improved efficiency (World Health Organization, 2007). Most European countries face the challenge of unsustainable healthcare systems, with health expenditures growing faster than national incomes and hospitals being pushed towards operating at their maximum capacity (Jovanović et al., 2020). Similarly, the UK NHS – as a tax-funded organisation – is suffering from continuous cost and rising efficiency pressures (Lafond et al., 2016; NHS England, 2015).

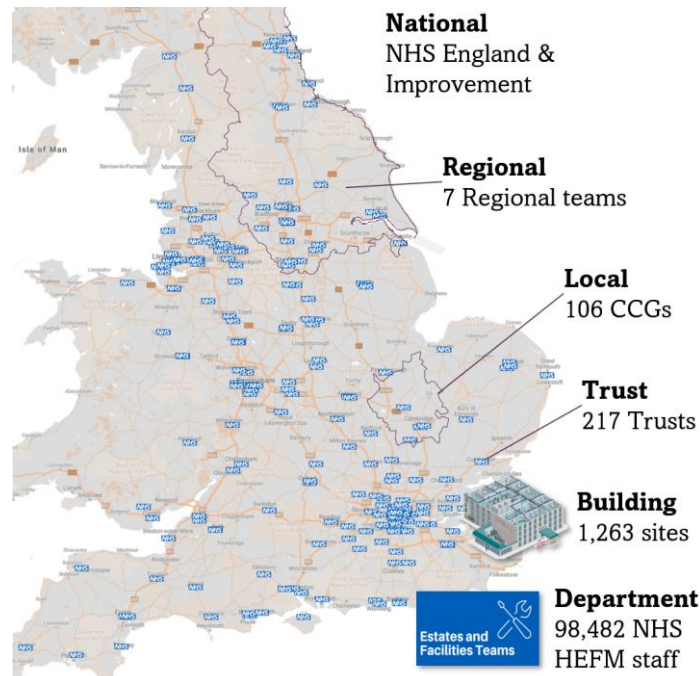

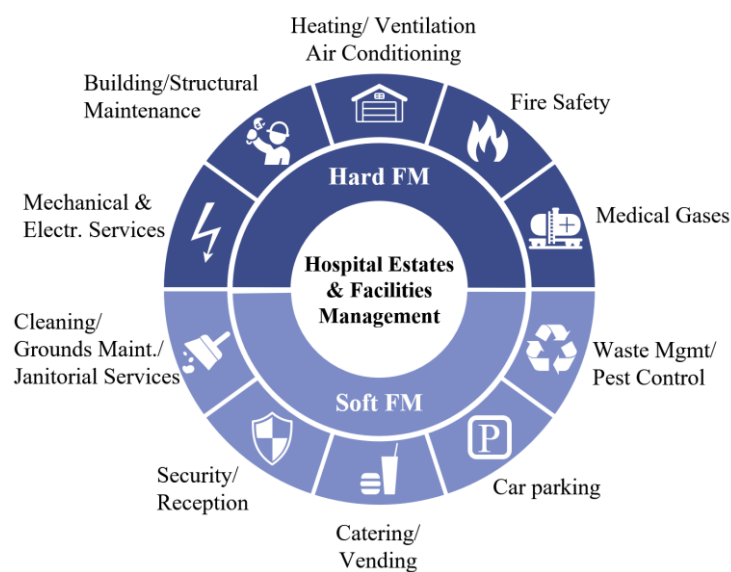

Figure 1: System levels in NHS secondary hospital landscape (Data and hospital locations from NHS ERIC return 2019/20)

The NHS consists of primary (e.g. general practices (GPs)), secondary (hospitalised patient care), and tertiary (specialised medical centres) care. Secondary care hospitals are geographically dispersed and also have a significant variety of organisational structures. Although the common goal of high-quality patient care unites the entire healthcare system, multiple system levels (as visible in *Figure 1*) and varying degrees of freedom to respond to local obligations depending on the organisational type (Auschra, 2018) cause the NHS to act as a group of organisations with their own interests – displaying characteristics of a pluralistic organisation (May, 2018). Hence, knowledge flows among NHS hospitals are less straightforward than one might expect in a single-payer healthcare system.

## 2.2 Estates and facilities management

Alexander (1996) describes FM as the process by which an organisation integrates multi-disciplinary activities within the built environment and the management of their impact on people and the workplace. FM departments

ensure that their buildings, systems and services support the core operations and processes, contributing to organisations' strategic objectives in changing conditions. Thus, FM involves both strategic and operational considerations there as well as multiple disciplines that can be categorised into hard (management and maintenance of property and infrastructure) and soft (management of support services) FM (*Figure 2*).

*Figure 2: Multi-disciplinary services in HEFM departments*

The nature of hospitals requires HEFM to operate buildings safely 24/7. Hence, HEFM departments have to respond to challenges in the environment promptly. To respond to such challenges, staff can use official NHS documents such as Health Technical Memoranda (explained in more detail in section 4.2.1) or they can draw on experience from similar situations in the past. However, if neither of these strategies succeeds, HEFM workers need to tap into the experience of fellow HEFM workers. Hence, knowledge needs to flow across organisational boundaries effectively, especially when considering the risks involved in ensuring patient safety at all times. The policies in many hospitals require HEFM departments to ensure that services are provided based on national best practice (Portsmouth Hospitals NHS Trust, 2019). However, previous studies have highlighted that KS among NHS Trusts is very limited (Barlow et al., 2009).

Furthermore, while the lack of inter-organisational communication is often stressed, only poor attempts to “remedy the situation” (Pathirage et al., 2008) are evident such that Nutt suggested, that the KS “may be the most underutilised tool in FM” (2000).

### **2.3 Managing change**

The terms resilience and sustainability have both gained widespread attention over recent decades. The sustainability concept originated from the Club of Rome’s *The Limits to Growth* (Meadows et al., 1972) which stressed the limits of economic growth, while the resilience concept emerged as a descriptive paradigm for analysing disturbance and change in the ecology domain (Zanotti et al., 2020). Both concepts have been interpreted in multiple ways, depending on the domain and the ultimate purpose, e.g. different answers to questions such as ‘of what’ and ‘to what’. Applications of this can be seen in the disaster resilience literature (Tiernan et al., 2019) or the triple-bottom-line sustainability equivalence in business literature (Elkington, 1999). While both concepts lack terminological clarity, some scholars regard this absence of clarity as a strength since it allows for a shared vocabulary across interdisciplinary spaces (Purvis et al., 2019). In the context of complex adaptive systems, sustainability is described as a process by which a system mitigates changes to maintain resources above normative levels, whereas resilience is a process by which a system adapts to changes by building capacities to return to the desired state (Lew et al., 2016). Blanchet et al. (2017) proclaim the need to combine and integrate different forms of knowledge to react to changing environments. Thus, both concepts include the need to manage changes through the application of knowledge.

### **2.4 Knowledge sharing across organisational boundaries**

Davenport and Prusak describe knowledge as “a fluid mix of framed experience, values, contextual information, and expert insight [which] [...] often becomes embedded not only in documents or repositories, but also in organisational routines, process is, practises and norms” (1998). Knowledge can be categorised in various ways such as codified and non-codified knowledge. Well-known works have framed the terms explicit and tacit knowledge (Nonaka, 1994; Polanyi, 1966). Explicit knowledge is “what can be embodied in a code or a

language and as a consequence it can be verbalized and communicated, processed, transmitted and stored relatively easily”, whereas tacit knowledge is rooted in our experiences and is difficult to express and transfer to another person since we are unaware of it and how it could be useful to others (Nonaka et al., 2000).

However, epistemological studies argue that tacit knowledge is developed through practice and is so deeply rooted in human beings that it cannot be shared, as it is by its very nature hidden and inexpressible (Athens and Tsoukas, 2003). Powell and Ambrosini (2012) build on this epistemological issue and adopt the terms documented and undocumented knowledge, as it provides “distance from the confusion over the tacit-explicit knowledge dichotomy”. Documented knowledge is a direct analogue to explicit knowledge, whereas undocumented knowledge is “simply knowledge that has not been written down, which can be articulated in a discussion or documented at a later time” (Powell and Ambrosini, 2012).

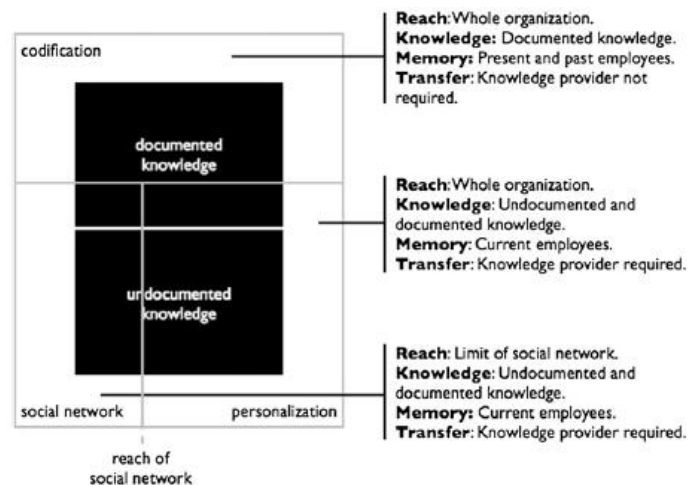

Figure 3: Knowledge sharing strategies (Powell and Ambrosini, 2012)

As visible in *Figure 3*, there are three mechanisms through which documented and undocumented knowledge can be shared (Powell and Ambrosini, 2012). Without any formal KS approaches, external knowledge is accessed via social networks, through which staff reach out to contacts within teams and other organisational units. To overcome the limited reach of social networks,

personalisation techniques can facilitate the efficient identification and use of the 'best' organisational knowledge. Another KS strategy is to codify undocumented knowledge and collect relevant documents in repositories in which knowledge can be systematically searched and accessed without the need to contact the knowledge source. However, especially when using IT systems, there can be significant resistance from HEFM staff as it might feel like the codification process adds yet another task to a system lacking necessary resources (Karam et al., 2018).

Figure 4: Adapted CHAT framework to analyse knowledge flow (Amended from Lin et al., 2008)

The effectiveness of KS activities is influenced by various factors throughout the process. To explore the underlying complexity of human behaviour involved in KS, the cultural-historical activity theory (CHAT) model provides a practical framework (Lin et al., 2008). It focuses on the relationship between knowledge source and recipient, as well as the nature of the knowledge transferred and the organisational and knowledge flow context as visible in Figure 4.

## 2.5 Literature summary and theoretical framework

The review of the relevant literature domains introduced the relevant literature domains and underlined the importance of effective KS for HEFM departments facing sustainability and resilience challenges. The theoretical framework in Figure 5 provides a common understanding of relevant concepts, capturing links between them. Although the framework is a simplified model of the complex healthcare reality, it is a useful tool to convey the theoretical assumptions of this research. The framework consists of four major sections: (i) building blocks, (ii) activities, principles, mechanisms, (iii) impacts, and (iv) changes.

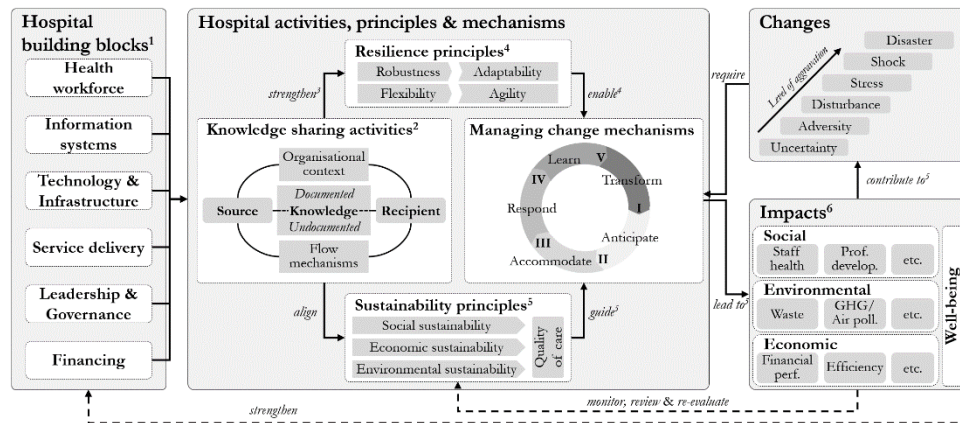

Figure 5: Theoretical framework connecting reviewed literature domains and concepts  
<sup>1</sup>WHO, 2010; <sup>2</sup>Amended from Lin, Tan, and Chang, 2008; Powell and Ambrosini, 2012;  
<sup>3</sup>Blanchet et al., 2017; <sup>4</sup>Fricke and Schulz, 1999; <sup>5</sup>Marmot, 2010; <sup>6</sup>Buffoli et al., 2013)

Firstly, the six building blocks represent essential inputs for the hospital system, such as workforce and financing (World Health Organization, 2007). Although there are limitations of the WHO model when analysing dynamic, complex and interlinked systems for applied research, its simplicity provides a common understanding and language for researchers (Mounier-Jack et al., 2014). All of these inputs contribute to organisational activities, principles and mechanisms. For example, the organisation of the healthcare provider landscape – belonging to the “service delivery” building block – significantly influences KS practices (Kim et al., 2012).

Secondly, the organisational activities, principles and mechanisms are illustrated in the centre of the framework. There are a great variety of organisational activities related to managing changes, e.g. risk management, leadership for change or technology management. However, since KS activities are the focal point of this research, the CHAT model, adapted to distinguish between documented and undocumented knowledge, is used to demonstrate knowledge flows from a source to a recipient within or across organisational boundaries. These KS activities strengthen the resilience principles (Blanchet et al., 2017), outlined in Table 1.

Table 1: Resilience principles as formulated by (Fricke and Schulz, 2005)

<b>Resilience principles</b>	<b>Definition</b>
<b>Robustness</b>	Capability to deliver intended functionality under varying operating conditions without being changed.
<b>Adaptability</b>	Capability to adapt itself towards changing environments to deliver its intended functionality. Robustness is a prerequisite to achieve adaptability. Change from external is required.
<b>Flexibility</b>	Property of a system to be changed easily without undesired effects.
<b>Agility</b>	Property of a system to implement necessary changes rapidly. Flexibility is a prerequisite to achieve agility. Change from external is required.

Sustainability principles integrate normative values with organisational processes. Balancing these social, environmental, and economic sustainability principles as well as providing high quality-of-care are increasingly recognised and integrated into organisational objectives of hospitals. These sustainability principles, which are described by numerous terminologies or normative statements, guide organisational mechanisms in hospitals (Buffoli et al., 2013; Marmot, 2010). The mechanisms of managing change are divided into five stages: anticipate, accommodate, respond, learn, and transform. These terms capture the most commonly described actions, systems can take when exposed to changes, as confirmed in a recent scoping review on resilience by Fridell et al. (2019).

Thirdly, hospital operations have social, environmental, and economic impacts and also affect the well-being of staff and patients. These broader categories of impacts can be broken down into a multitude of criteria and measurable indicators, as proposed by Buffoli et al. (2013) in their hospital sustainability evaluation tool.

Fourthly, multiple studies have found that healthcare systems can contribute to environmental changes (Lenzen et al., 2020) as well as social and economic inequalities (Marmot, 2010; Serapioni, 2017). These changes – differing in their frequencies, likelihoods, lead times, durations, etc. – can affect hospital systems and require mechanisms to manage those changes. There are external stressors, e.g. natural disasters or financial pressures, as well as internal changes, e.g. initiatives to decarbonise operational activities or demographic shifts in the workforce.

## 2.6 Research gap and collection of barriers and channels identified in the literature

Various studies have stressed the lack of effective KS among NHS HEFM departments (Kothari et al., 2011). However, so far, research studies have either focused on KS among clinical disciplines or FM organisations operating outside the complexity of healthcare systems (McCracken and Edwards, 2017; Pathirage et al., 2008). To enhance the understanding of effective KS among HEFM departments, this paper addresses the following question: What KS barriers and channels exist among NHS HEFM departments?

To build on already undertaken research, the literature on healthcare and FM was thoroughly reviewed and analysed for KS channels and barriers.

Table 2 summarises different KS channels. For documented knowledge, codification strategies such as guidance documents and library services provide effective storage tools, while newsletters, bulletins or blog posts provide effective ways by which to disseminate topical knowledge (Adeyemi and Olla, 2020). For undocumented knowledge, there are various mechanisms – such as communities of practices and action learning – beyond informal social networks. These channels enable individuals to share undocumented knowledge of value in the same or different HEFM disciplines (Kothari et al., 2011).

Table 2: Channels for different KS strategies (Adeyemi and Olla, 2020; Kothari et al., 2011; Pathirage et al., 2008)

Strategies	Codification	Social Network	Personalisation
<b>Channels</b>	<ul style="list-style-type: none"> <li>▪ Guidance/ Technical Manuals/ Reports</li> <li>▪ Intranet</li> <li>▪ Library Services</li> <li>▪ Newsletter/ Bulletin boards/ Blog</li> </ul>	<ul style="list-style-type: none"> <li>▪ Informal networks within organisations</li> </ul>	<ul style="list-style-type: none"> <li>▪ Communities of Practice</li> <li>▪ Brainstorming</li> <li>▪ Action learning</li> <li>▪ Post project reviews</li> <li>▪ Discussion groups</li> <li>▪ Expert directory</li> </ul>

Similarly, a list of KS barriers from previous studies was collected and structured according to knowledge boundary (source and recipient), knowledge transferred, organisational context and knowledge flow mechanisms as visible in Table 3. For boundary-related barriers, sub-categories of leadership, operational staff and culture were created to provide more structure.

Table 3: Collection of identified KS barriers in the FM and healthcare literature

Structure	Barriers
Boundary	<b>Leadership</b>
	<ul style="list-style-type: none"> <li>▪ Lack of adequate knowledge among FM managers (Baaki et al., 2016)</li> <li>▪ Leadership programmes for collaborative behaviour are required (Hailey et al., 2017)</li> </ul>
	<b>Operational staff</b>
	<ul style="list-style-type: none"> <li>▪ Lack of awareness of tacit knowledge in operational &amp; middle management workers (Pathirage et al., 2008)</li> <li>▪ Pre-existing expertise required (Kothari et al., 2011; Naylor, 2017)</li> <li>▪ Education of staff about sustainable FM practices (Baaki et al., 2016)</li> <li>▪ Lack of trust in other people's knowledge (Adeyemi and Olla, 2020)</li> <li>▪ Fear for loss of hegemony (Lin et al., 2008)</li> <li>▪ Reliance on techn. manuals, documents and intranets due to limited social networks due to lack of professional development (Pathirage et al., 2008; Wetherill et al., 2007)</li> </ul>
Knowledge transferred	<b>Culture</b>
	<ul style="list-style-type: none"> <li>▪ Unopen to KS (Adeyemi and Olla, 2020; Kothari et al., 2011)</li> <li>▪ Punitive environments (Kim et al., 2012; Waring et al., 2013)</li> <li>▪ Risk aversion of HEFM staff (Barlow et al., 2009)</li> <li>▪ Lack of motivation &amp; "asking why" thinking (Kothari et al., 2011)</li> </ul>
	<ul style="list-style-type: none"> <li>▪ Immobility (tacitness) of knowledge (Lin et al., 2008; Nonaka, 1994)</li> <li>▪ Explicit &amp; tacit knowledge of staff not effectively used in standards (Puddy et al., 2001)</li> <li>▪ Some knowledge types are difficult to share with external peer groups (Pathirage et al., 2008)</li> <li>▪ Information overload (Kothari et al., 2011)</li> </ul>
	<ul style="list-style-type: none"> <li>▪ In- &amp; outsourcing of services (Currie et al., 2007; Yousefli et al., 2017)</li> <li>▪ PFI ownership model affects capital spending (Barlow et al., 2009; May, 2018)</li> </ul>
Organisational context	<ul style="list-style-type: none"> <li>▪ Partly low degree of autonomy &amp; support for HEFM (May, 2018)</li> <li>▪ Benchmarking/ competitive pressures (Agostini et al., 2020; Currie et al., 2007)</li> <li>▪ Lack of overarching Estates strategy (Naylor, 2017)</li> <li>▪ Critical knowledge is often siloed and at risk of getting lost (British Standards Institute, 2018)</li> </ul>
Flow mechanisms	<ul style="list-style-type: none"> <li>▪ Top-down communication approach only useful to pass down information, not knowledge (Kothari et al., 2011; May et al., 2006)</li> <li>▪ Bureaucratic procedures (Adeyemi and Olla, 2020)</li> <li>▪ Lack of formalised collaboration &amp; professional role clarification (Adeyemi and Olla, 2020; Karam et al., 2018)</li> <li>▪ Relevant knowledge is fragmented in various documents (Wetherill et al., 2007)</li> </ul>

### 3 Research design, data collection and analysis

To address the research question, a deep understanding of the complex healthcare system – described as a “tangled web of interdependencies” (Becker and Carthey, 2007) – is required. Due to this, many issues in healthcare systems are systemic and rarely caused by any one single factor (Loosemore et al., 2012). To explore this complex system consisting of people, resources, processes and institutions, a systems approach is required to enable a holistic understanding of all system elements and their interrelationships.

A thorough literature review investigated the existing literature and built an understanding of the existing concepts as well as KS barriers and channels. This literature review was further informed through exploratory, qualitative interviews with stakeholders, including HEFM operational staff, managers and directors, NHS England & Improvement staff, and academic experts as visible in

*Table 4.*

Table 4: Overview of conducted interviews with NHS and external stakeholders

#	Interviewee Code	Company	Job level	Interview Date
1	NHS1	NHS Trust	HEFM Manager	10.02.2021
2	NHS2	NHS Trust	HEFM Manager	10.02.2021
3	NHSE/I1	NHS England/Improvement	Top Management	19.02.2021
4	Academia1	University Researcher	PhD	23.02.2021
5	NHE/I2	NHS England/Improvement	Top Management	25.02.2021
6	Contractor1	Sustainability Consultancy	Top Management	26.02.2021
7	Prof. Body1	Top Management	HEFM Professional	26.03.2021
8	Academia2	University Researcher	PhD	04.03.2021
9	Academia3	University Researcher	Professor	25.03.2021
10	NHS3	NHS Trust	Carbon & Energy Manager	26.03.2021
11	NHS4	NHS Trust	Energy & Sustainability Manager	14.04.2021
12	NHSE/I3	NHS England/Improvement	Top Management	07.06.2021

The primary qualitative data was analysed following a two-step process of structural and axial coding using the coding software Nvivo. The first iteration of coding identified and summarised themes relevant to the identified research questions in coding nodes. Then, the second coding iteration was performed to identify previously overlooked passages. Lastly, axial coding was performed to

find overarching categories and themes. Each theme contained multiple codes, was analysed by comparing interviewee quotes, and then interpreted in the context of existing literature.

## **4 Findings and Discussion**

In this section, the data from the exploratory interviews (indicated through the use of *Italics*) is discussed in light of the barriers and channels already identified in the literature, as summarised in *Table 3* and

*Table 2.*

### **4.1 Barriers to KS**

#### **4.1.1 Boundary**

The interviewees mentioned already well-known barriers in the wider KS literature. These included the 'knowledge is power' issue (Lin et al., 2008), with one interviewee stating that "for more hand-on staff retaining knowledge about the systems [...] provides job security". Another barrier mentioned by interviewees was the lack of pre-existing expertise, since operational workers have "nobody invest in [their] education or professional development for 20 years", as already identified by (Kothari et al., 2011; Naylor, 2017).

A factor that has not been identified in previous HEFM studies is that the career pathways and educational background of Estates Managers and Directors have changed. While "15 years ago, we encountered Estates Managers who had worked in the Trust for a decade [...] and really knew their building and understood all of the properties [...], the next generation of Estates Managers" seems to have more of a management background and "probably a lot less knowledge" about the buildings. Although Baaki et al. (2016) previously identified the lack of adequate knowledge among facilities managers as a barrier to KS, the findings from the data provide a possible root cause for the lack of expertise. Furthermore, HEFM Managers and Directors are "forever moving between organisations [so] it is a constant churn of resource [...] and therefore decisions made at a high level are often lost in the midst of time". Another interviewee described that different "personalities of [...] managers" also lead "to a massive disengagement between the workforce and management" in some Trusts.

#### 4.1.2 *Knowledge transferred*

Despite previous studies pointing at tacit knowledge as the focal point of KS barriers (Lin et al., 2008; Puddy et al., 2001), interviewees predominantly mentioned knowledge types of which people are mostly well aware, namely successes and failures: “We find people doing really great things and they've never told anybody. [...] So sometimes we are our own worst enemy.” One interviewee mentioned that this could be a cause for “a lot of examples of really not understanding the building type and doing very silly things”. However, as another interviewee described, “sometimes people don't want to be held up as being the poor example of anything.” This is particularly interesting, as the causes for not sharing successes and failures could be rooted in specific leadership styles, potentially creating punitive environments as identified by Kim et al. (2012).

#### 4.1.3 *Organisational context*

With regard to organisational context barriers, four major topics emerged from the data. Firstly, the fragmentation of the healthcare system was highlighted, with “every organisation [being] so siloed” that it “feels like every hospital makes it up as they go along [and] they are captains of their own ships”. Secondly, many hospitals have buildings that were financed through private finance initiatives (PFI), and hence have external stakeholders that have “got full control of buildings”. This presents additional barriers in the pursuit of sustainability initiatives since – according to one interviewee – external PFI investors can tell the Trust management: “you've made this commitment to zero carbon. If you want to do that project, it's going to cost you this”. In addition, many hospitals outsource some or all HEFM services to external contractors. As a result, these external contractors sometimes do not have access to internal NHS knowledge sharing tools such as the Collaboration Hub (explained in section 4.2.1). Outsourcing of services also leads to a loss of knowledge about the respective HEFM discipline so that Estates departments' personnel “often don't have the expertise in many areas”. These issues have also been identified in previous studies (Barlow et al., 2009; Yousefli et al., 2017).

Thirdly, already identified issues regarding competitive pressures among NHS Trusts through Trust-level benchmarking were observed. The “degree of competition [...] means [HEFM departments] tend to hold things a little bit closer to their chest, rather than sharing quite so freely in some respects”. Since

knowledge sharing involves complex human interaction, “it’s a tall order to [...] expect today’s leaders to re-engineer their mindsets away from the last 30 years’ emphasis on competition and towards collaboration” (Hailey et al., 2017). Fourthly, the political standings of HEFM departments vary among Trusts. There are “Estates directors sitting on the boards in some trusts, but no means all of the trusts”, and since “Estates departments fight over budget with the medical departments, there is this enormous power struggle going on”. Hence, the varying degrees of autonomy and support for HEFM create greatly varying political environments for HEFM departments in different NHS Trusts as observed by May (2018).

#### *4.1.4 Knowledge flow mechanisms*

Regarding flow mechanisms, two barriers emerge from the data. For top-down knowledge flows from the central NHS body – NHS England and Improvement (NHSE/I) – there are very long approval processes for standard operating procedures. Hence, official guidance such as ‘Health Technical Memoranda’ are only updated once every 5-10 years and more topical issues such as urgent oxygen capacity issues during COVID-19 require long bureaucratic processes to publish, as identified by (Adeyemi and Olla, 2020). Hence, top-down communication only proves useful to pass down information (Kothari et al., 2011; May et al., 2006) and relevant knowledge becomes fragmented in various documents (Wetherill et al., 2007) and is often outdated.

Furthermore, multiple reorganisations of the NHS have led to the loss of forums where HEFM managers could “speak to each other”. Previously, HEFM managers “met regularly every three months and shared knowledge between [themselves], [...] and how [they] could help each other [...]. That no longer exists.” Since another interviewee described that there is not “anyone in the Trust who would be able to advise” on issues regarding system efficiency, the lack of opportunities to discuss such challenges with peer groups across organisational boundaries is alarming.

## **4.2 KS channels**

### *4.2.1 Codification*

The NHS has multiple strategies by which to disseminate codified knowledge among NHS Trusts. Firstly, NHSE/I disseminates guidance documents. These

consist of Health Building Memoranda (HBNs) and Health Technical Memoranda (HTMs). However, as seen in Figure 6, these are only reviewed and published after long approval processes over the course of many years. Hence, even though the guidance documents are useful to provide a good understanding of buildings, they do not prove helpful when facing complex challenges regarding the resilience or sustainability of buildings.

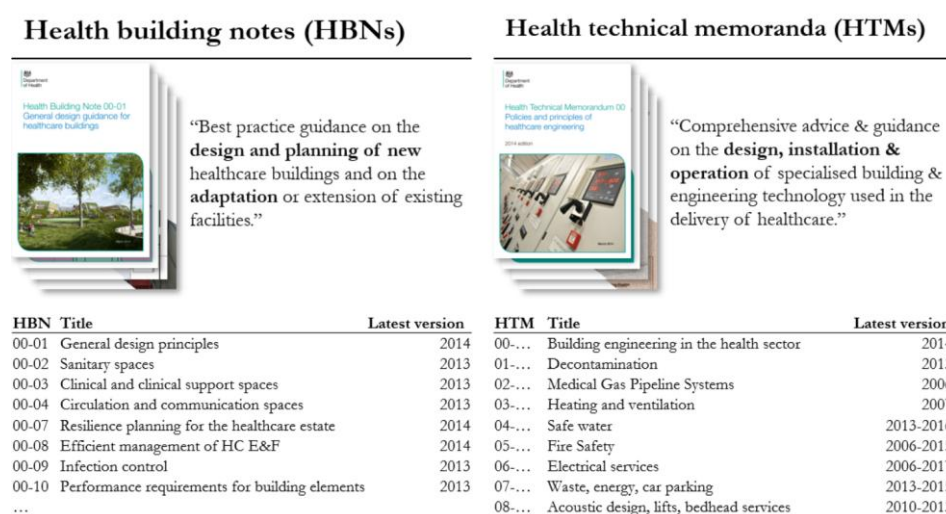

Figure 6: Overview of official guidance documents for HEFM  
(Source: UK Department of Health Website)

Furthermore, NHSE/I has created an online 'National Estates Team Collaboration Hub' to which only NHS HEFM staff have access. The Collaboration was initially *“just a place for key documents around the Carter efficiency program”*. Within the Hub, different channels such as 'Hard FM Hub' or 'Soft FM Hub' and sub-channels such as 'Electrical' or 'Fire' provide central locations for important documents. Furthermore, discussion channels allow users to ask questions and receive answers from their peer groups. However, as one Estates Manager interviewee stated, *“the Collaboration Hub isn't used because it isn't timely and you get lost in the chats”*, whereas another interviewee describes it as a *“self-help environment”* for day-to-day questions rather than a channel for sharing domain-specific knowledge. As a result, the Collaboration Hub currently has *“relatively little interaction”*.

#### 4.2.2 *Social Networks*

As discussed in section 4.1.1, HEFM Managers and Directors are appointed to different Trusts relatively often and can therefore build extensive social networks. As Pathirage et al. (2008) point out, HEFM Managers and Directors also have more opportunities to attend professional development programmes in which they can meet with their peer group and extend their social networks. In contrast, operational-level staff do not have the same social network reach, as they are provided with fewer opportunities to attend professional development programmes. Nevertheless, multiple interviewees reported that there seems to be “a reluctance to talk to each other [...] even between Trusts that are just 30 miles apart”. Therefore, it appears that currently social networks of HEFM staff are both limited in reach and not effectively utilised.

#### 4.2.3 *Personalisation*

NHS Estates – the former arm’s length body and executive agency representing the Department of Health – was responsible had a central role in disseminating knowledge and fostering collaboration among NHS Trusts (May, 2018). However, after its abolishment in 2004, these KS mechanisms were essentially lost. One academic interviewee mentioned that HEFM Directors who had participated in previous research studies mentioned “that they missed interacting with each other on hospital-level” after the abolishment of NHS Estates. Some KS mechanisms were then taken over by external professional bodies, e.g. the Health Estates and Facilities Management Association (HEFMA). These are membership bodies, within which members can meet regularly to discuss topics of interest. Moreover, some of the bodies publish guidelines such as ‘A Healthcare Engineering Roadmap for Delivering Net Zero Carbon’ by various bodies including HEFMA. However, due to the membership model, the reach of these networks is inherently limited.

In addition, there are various formal and informal networks on more regional bases. As visible in *Figure 1*, the NHS Figure 1 is made up of 106 Clinical Commissioning Groups (CCGs), each combining multiple local Trusts. As part of the change of regional structures towards Integrated Care Systems (ICS), various CCGs have already been converted into ICSs. Moreover, there are so-called Strategic Transformation Partnerships (STPs) which also combine healthcare stakeholders in different regions. However, as the organisational structures have

changed multiple times in past years and the groups also include stakeholders such as GPs or social-care providers, KS concerning hospital infrastructure is limited. Multiple interviewees reported, that these groups meet irregularly and are often unsuitable for their requirements, so that multiple informal networks in specialist HEFM domains were formed driven by the lack of formal KS channels during COVID-19.

## 5 Conclusions

This paper has sought to explore the question: What KS barriers and channels exist among NHS HEFM departments? To address this question, primary data in the form of 12 exploratory interviews was collected and analysed in light of previously identified barriers and channels in the literature. In

Table 5, a summary of key insights is presented.

Table 5: Key take-aways from exploring KS barriers and channels among HEFM departments

KS structure	Barriers
<b>Boundary</b>	<ul style="list-style-type: none"> <li>▪ Different educational background of HEFM Managers/Directors</li> <li>▪ Disengagement between management &amp; staff</li> </ul>
<b>Knowledge transferred</b>	<ul style="list-style-type: none"> <li>▪ Lack of sharing successes &amp; failures</li> </ul>
<b>Organisational context</b>	<ul style="list-style-type: none"> <li>▪ Complexities through different ownership and service outsourcing models</li> <li>▪ Inter-Trust competition</li> <li>▪ Board representation of Estates Managers</li> </ul>
<b>KS Mechanism</b>	<ul style="list-style-type: none"> <li>▪ Long approval processes for official guidance</li> <li>▪ Frequent reorganisations lead to loss of KS structures</li> </ul>
KS mechanisms	Channels
<b>Codification</b>	<ul style="list-style-type: none"> <li>▪ Long &amp; bureaucratic procedures for guidance documents</li> <li>▪ Use of Collaboration Hub still limited</li> </ul>
<b>Social Network</b>	<ul style="list-style-type: none"> <li>▪ Limited reach &amp; reluctance to reach out</li> </ul>
<b>Personalisation</b>	<ul style="list-style-type: none"> <li>▪ Various informal KS channels but without consistent</li> </ul>

The academic contribution of this research lies in enhancing the understanding of KS in complex systems with multiple stakeholders and constraining factors.

While clinical, evidence-based KS is a topic of frequent interest for researchers, no studies have so far focused on KS in the area of HEFM.

The healthcare sector can also greatly benefit from the research. While some ad-hoc COVID-19 responses and structures will soon disappear, learning from disasters is critical for addressing future social and environmental shocks. Hence, observing what is working and what is not working is very important. Therefore, the identified barriers in this research can inform policy and decision-makers in enhancing the conditions for effective KS. Effective knowledge flows can then improve the economic and environmental performance of the healthcare system while preserving resilience to adverse events.

### **5.1 Limitations and further research**

Firstly, only 12 interviews were conducted, which is inadequate to reflect the vast complexity and uniqueness of the NHS hospital landscape. However, for the exploratory nature of this study, the number of interviews was deemed sufficient to enable an initial understanding of the dysfunctions of the system. Due to the ongoing COVID-19 pandemic, interviewees experienced greater time pressures and in-person interviews were not possible. Therefore, no face-to-face interviews nor on-site observations could be conducted.

This exploratory study uncovered previously unknown barriers and channels in the HEFM landscape which enhance the understanding of the complex healthcare system environment. Building on this, further research could analyse the following questions in more detail:

1. To what extent can disparities in managing challenges during COVID-19 be explained by different levels of knowledge sharing among HEFM departments?
2. What format is required to effectively capture the experience of the knowledge source and meet the requirements (time, pre-existing knowledge, etc.) of a wide range of HEFM recipients?

### Abstract

Should managers be more trained in the topic of diversity? Must they develop specific skills and competences? Which strengths and weaknesses regarding diversity management do managers have? A qualitative investigation tried to answer these questions. Around 70 interviews with managers and employees of large DAX companies were conducted. It could be shown that there are tensions between self-perception and perception of others and the assessment of the significance of diversity attitudes and measures, competences, and their actual implementation. These findings suggest that there is the need to train competences, in particular intercultural competence.

**Paper type** – Academic research Paper

### 1 Introduction

Diversity has become more and more important in Germany and in other European countries due to increased European integration and globalization. People from different cultures are interacting daily nowadays, whereas this was a very rare situation in the past (Fantini. 2009). While immigration postpones the ageing-process in (especially western) societies (Eurostat, 2017) and offers great

chances for the economy (Franken, 2015), cultural diversity also constitutes risks. Consequently, a strong interest of society and economy regarding diversity management has risen. Over 2.600 organisations signed the Diversity charter of German companies, committing to the aims of reducing discrimination and supporting inclusion. On the contrary, when looking at the national cross-section of organisations in Germany, approximately two thirds of the organisations are not actively implementing diversity management (KFW Research, 2017). People with migration backgrounds still face discrimination in several contexts, although they carry important potentials for organisations and societies.

Research has shown that in order to utilize the potential of diversity successfully, organisations need to promote diversity actively, especially for women, people with a migration background and older employees in Germany (Fuchs and Dörfler, 2005). This process requires sensitivity and competence towards diversity by managers and employees. Managers have the role to share a diversity strategy with the employees and to be an example in living openness and fairness. In a comprehensive article Martins (2020) describes the role of leaders in the diversity management process as twofold: framing a diversity vision and symbolizing the value of diversity in words and action. To fulfil this role, managers need to have a strong believe that diversity constitutes an advantage to their company, as well as a clear perception of what diversity means in the context of their company. Who is in which way diverse and to whom is diversity important, as well as whether there are inequalities and discrimination in their company. Based on this knowledge managers are ought to share their attitudes and behaviours with employees and thus shape the companies' culture towards diversity (Franken, 2015). However, there is little research on the perspectives of managers and employees on the specific challenges, risks and chances connected to diversity. The question remains, in how far managers are able to perceive diversity related issues within their company, the same way employees see them. The current study thus aims to explore and compare the subjective theories of managers and employers of big German companies in a qualitative study design.

## **2 Review**

*Diversity* refers to the diversity of people in companies (Becker, 2006) and the main attributes and differences of individuals (Mayer et al., 2018). This includes obvious, barely perceived, and salient characteristics like age, religion, sexual

orientation, cultural values as well as slowly and less obviously changing characters like language, competences and values (Genkova and Ringeisen, 2017). In 2015, approximately 4.7 million migrants immigrated to the EU, whereby 2.4 million of those came from third-world countries. Germany, the United Kingdom, France, Spain, and Italy showed the highest level of immigration. Around 35.1 million people born outside of Europe live in the EU. Inside the EU, 19.3 million people migrated (Eurostat, 2017). Of those, Romanian, Polish, Italian, Portuguese and English people made up the five biggest groups of EU-citizens who immigrated to another EU-state (Eurostat, 2017). Thus, European organizations are confronted with an increasing cultural diversity of the society, accompanied by the aging of western societies and an increasing attention towards gender diversity and equality. Consequently, age, gender, and cultural background are the most important and most considered dimensions of Diversity in Germany (Genkova and Ringeisen, 2017).

Diversity management intends to adapt the values, attitudes and behaviors of organization and working groups in a more diverse direction and integrate the concept of diversity into organizations (Ashikali and Groeneveld, 2015). To achieve successful diversity management, employees and their heterogeneity must be appreciated (Vedder, 2011). Regardless of their cultural individual characteristics, all employees should be treated fairly, and it should be possible for them to use their skills freely without any norms and prejudices (Vedder, 2011).

In general, research tries to find and give proof that diversity management has positive effects on the success of organizations. Nonetheless, findings strongly depend on specific circumstances (like leadership, organizational culture, employees attitudes, e.g., Genkova and Ringeisen, 2017). In practice, there are many motivations and normative convictions to integrate diversity in an organizational strategy and culture (Ely and Thomas, 2001; Jansen, Otten and Van der Zee, 2015). Studies show that organizations who do not use diversity management are confronted with negative consequences and weaken others and themselves. In research it was found that that even though diversity comes with many advantages, it can also be the reason why conflicts and contra productive behavior like discrimination and group-think arise (Kersting and Ott, 2016).

In past research, stress, physical and psychological health concerning migration have been looked at from a discrimination and fairness perspective (Eggert and Flynn, 2013). The burden of migration is high because of ineffective coping

behaviour and stressors that appeared (Eggert and Flynn, 2013). The well-being of people with a migration background can be influenced by discrimination, stress events and social isolation (Bozorgmehr and Razum, 2015). Organizations, not only individuals, can cause discrimination by having structures and processes that make it difficult for migrants to get access to the labor market and to work in the field of their key qualification. This phenomenon is called structural discrimination. To counteract this, structural integration, that can support people with an immigration background to work in their key qualification, is needed. Signs of structural discrimination can be seen in most organizations. Consequently, people who have an immigration background are less strong on the labor market, in comparison to people without an immigration background. Their foreign degrees are often not recognized, so that they are not allowed to work in the field of their qualification (Badura et al., 2010). Research has found that there is a negative relation between psychological integration and education. Consequently, immigrants with a high education surrender from the host society (De Vroom and Verkuyten, 2015). The "Glass ceiling effect" deals with gender and discrimination. People with an immigration background are more severely affected by it because frustration and disappointed career expectations lead to a negative view of the host society. In the current, fast changing world, people without an immigration background also feel stress as they must change their habitual, socially established perspectives. This stress is one of the main causes for intergroup hostility. Consequently, persons with and without an immigration background must adapt to changing points of view and unfamiliar methods (Van Assche et al., 2018).

Besides preventing such negative effects of diversity, it is becoming more and more important to find out which positive effects diversity management brings for organizations. Diversity can indeed have an enriching effect on companies and individuals, provided that the given degree of diversity within the group is worshiped and utilized (Page, 2007). Studies have shown that people, who think positively of diversity, believe that multicultural groups are better. They also tend to identify themselves more with the group (Van Dick et al., 2008). Wagner et al., (2008) have shown that people who believe that migrants are an enrichment have more contact with them and show less racism than those who do not share this belief. Stegmann (2011) demonstrated similar results in his Meta-Analysis and further showed that pro-diversity beliefs and a positive diversity culture contribute to valuable results for groups and individuals and increase job

performance. Similar results have been obtained for age diversity. In a meta-analysis by Finkelstein et al. (1995) it could be shown that younger people tend to estimate the development potential of older employees as small. Meanwhile, they considered older employees as reliable. Older team members show the advantage that they have experience and routine in e.g., cooperation with long-term customers, only if they feel worshiped and accepted (Wei and Lau, 2012). Also cultural and gender diversity only has a positive effect on team performance, if team members appreciate the given degree of diversity. Therefore, the diversity attitudes of colleagues and especially leaders are important.

The satisfaction, health and performance of employees is influenced by their leaders (Franken, 2015). Managers are key figures when integrating diversity management (Wildermuth and Gray, 2005). Leaders in a high position design the diversity strategy for the company and the middle management implements it. In this process, heterogeneity becomes obvious as managers are responsible for the success of diversity management and support diversity competences as well as reducing discriminating structures and individual behaviours (Thomas, 1990; Martins, 2020). Thereby, leaders must convince their employees of the importance of diversity (Dreas and Rastetter, 2016). In practice, leaders use different roles and many of them struggle with their role model function and performance pressure (Franken, 2015). While managers are ought to demonstrate openness and acceptance towards diversity theoretically, there is little research on the perspectives of managers and employees on the specific challenges, risks and chances connected to diversity. In order to actually implement diversity, leaders need to perceive the organization-specific aspects of diversity and assess challenges and chances realistically. This also means to assess the perspectives and hassles of employees with and without diverse characteristics. The current study thus aims to explore and compare the subjective theories of managers and employers of big German companies in a qualitative study design.

### **3 Method**

In order to investigate the perspectives and perceptions of employees and managers on diversity, 63 qualitative telephone interviews were conducted. The participants were asked about the issue of equal opportunities, especially equal opportunities of persons with an immigration background and elderly employees. To answer the leading questions, following hypotheses were set up:

*Explorative hypothesis: Managers and employees assess the need of diversity actions as equivalent.*

Quantitative hypotheses: Hypothesis 1: Managers and employees differentiate regarding the expression of the stress level of employees with and without an immigration background.

*Hypothesis 2: Managers and employees differentiate regarding the forms of the subjective assessment of the social competence.*

The method of a qualitative interview was used, because practice-relevant and scientific results of diversity, especially cultural diversity, and age diversity regarding managers, rarely exist. The study design makes it possible to show the relationships and backgrounds of the topic of diversity and the challenges of the Human Resource Management from the point of view of managers and human resource managers. In addition, it is possible to find out about diversity potentials and obstacles concerning the equal opportunities of people with an immigration background and ageing people. A structured interview guideline was used. With qualitative interviews, non-considered aspects can be found to derive new conclusions. Here, the focus is especially on diversity measures and competencies that lead to success (Mayer, 2013). Also, it is investigated to what extent stress has an impact on employees with and without an immigration background. Standardised interviews are deductive, theory-based and increase comparability of the data (Mayer, 2013).

Open and closed questions were asked. For example: "How stressed are employees with an immigration background in your company at the moment, in your opinion?". Closed questions were answered with a 5-Point Likert Scale (1= not at all stressed until 5 = very stressed). The use of both open and closed questions makes it possible to find out about the individual views of participants and to compare the interviews among each other.

The quantitative content analyses by Mayring (2015) were used to analyse the interviews. The elements of the data were counted and compared in their frequency with other elements using Excel (Mayring, 2015).

The sample consisted of 17 managers and 13 human resource managers. 17 of them were male and 13 female. 15 of the questioned employees did not have an immigration background and 18 employees had an immigration background. 20 of them were female and 13 male. The average age of the managers was  $M = 40.83$  years ( $N = 29$ ;  $SD = 9.30$ ). The average age of the employees was  $M = 35.48$  years ( $N = 33$ ;  $SD = 9.99$ ).

## 4 Results

The explorative hypothesis is that managers and employees both consider the need of diversity actions equivalently high. Findings reveal that managers and employees assessed the diversity quotas highly, e.g., quota of women and migrants. Yet, these quotas are usually not legally consolidated and there is a subjective lack of official guidelines. Managers claimed that such quotas exist and are also implemented in organisations as internal orientations. Further measures implemented are having a diversity department, an equal opportunities officer and a diversity representative.

Many diversity measures in Germany consider gender diversity. Managers listed various measures, e.g., language courses, trainings, and exchange programmes or culture trainings that help to implement diversity in organisations.

Recruiters stated that "individual intercultural competence trainings are offered for employees who would like to deal with intercultural competences and to analyse their own intercultural competence". These trainings included e. g. issues like "How to recruit internationally?" Which aims at the intercultural difference at the recruiting. Further issues are "anti-prejudice [...] or emotional competencies." Contrarily, employees expressed that they did not notice any diversity measures at all. Employees who had an immigration background viewed the implementation of diversity actions as insufficient and were unsatisfied. Most of the diversity measures taken concerned its communication in organisations through on- and offline platforms, diversity departments and diversity committees. Both interviewed groups stated that there are offers of diversity trainings in organisations.

As most of the interviewed employees work in companies belonging to the Diversity Charta of German companies (Charta der Vielfalt and Ernst and Young GmbH, 2016) they have diversity implemented in the strategy of their companies. Employees emphasized that for them, one's own professional development and the equal treatment at the personnel selection was important. They mentioned that for a greater diversity it would be good to implement that "Anonymous applications will not be asserted. [...] Those, who have employee responsibilities and make personnel selections, should do diversity competence training. They must reflect themselves, if they are poised to hire someone, who is different from them. [...] I think that is actually the question and has to be answered by the human resource managers: Am I ready to hire somebody, who is different than I?"

Following the statements of employees, also a form of benefit analysis can be helpful “[...] which hide the background of people as good as possible. So therefore, only the professional skills, social competence and media competences are measured without being influenced by the appearance of the person, e. g. gender etc.”

Openness and cultural interest were very important to all participants. Tolerance and self-reflection were also important, followed by intercultural competence, cultural knowledge, and awareness. Both, employees with and without a migration background listed up more competences and differentiated stronger regarding the promotion of intercultural competence. This finding is similar to previous results.

Managers said that in the future, diversity competence will be important, but for now, they did not see it as important. They attributed externally. Managers believed that risk tolerance is an important factor regarding diversity competence. They furthermore mentioned emotional stability, intercultural flexibility, social identity, intercultural anti-prejudice as well as sensitisation for cultural differences. Employees, on the other hand, mentioned empathy and openness, social competence, self-reflection, cultural knowledge, and tolerance.

In previous research it became clear that a change of perspective and exchange of experiences are stronger predictors for intercultural decision-making (e.g., Genkova and Ringeisen, 2017). Change of perspective is a stronger predictor than empathy. Risk tolerance is not considered relevant for diversity and increasing intercultural competence. Managers view diversity as a threat and their level of stress was as high as they are seen as multipliers for diversity (see Table 1).

Table 1: Importance of Diversity

<b>Managers/ Human Resource Managers</b>	<b>Employees with and without an immigration background</b>
Seriousness and urgency of diversity is not clearly recognized.	Seriousness and urgency of diversity is not clearly recognized by employees without an immigration background
Incorrect assessment of the stress of migrants	Good assessment of the stress level of migrants by employees without an immigration background
No consideration of the stress level of migrants in the day-to-day management	Risk to see diversity as a problem

Managers as well as employees believe that diversity measures are important. The Findings of this study show that employees are more confronted with diversity, based on the number of mentions and differentiation. A possible explanation for this might be that employees face more diverse situations in their daily life and work than managers. It became obvious that there was a difference between how managers and employees perceive themselves and the outside. Both groups see more need for diversity measures for the other group and attribute the deficits to them. Diversity processes usually work top-down (Dreas and Raststetter, 2016). These top-down processes can only be successful when there is a strong expression of diversity sensitive competences (Dreas and Raststetter, 2016).

*Hypothesis 1: Managers and employees differentiate regarding the expression of the stress level of employees with an immigration background.*

Findings regarding the first hypothesis show that the level of stress of employees with a migration background is assessed in the same way by managers and employees ( $t = .035$ ;  $df\ 1; 49$ ;  $p = .972$ ).

The qualitative analysis supported the findings. It was shown that especially prejudices and the impatience of others based on language problems. Also, different work attitudes due to intercultural differences are seen as stressing by employees with an immigration background. This was emphasised by employees with an immigration background: "People with an immigration background have the feeling: I have to give more than 120 % than my German colleagues. This is one reason why migrants feel more stressed."

*Hypothesis 2: Managers and employees differentiate regarding the forms of the subjective assessment of the social competence.*

No significant difference concerning the subjective assessment of social competence between managers and employees could be found ( $t = -.489$ ;  $df\ 2; 59$ ;  $p = .628$ ). It could indicate that both groups see themselves as prepared for the challenges of diversity management. Matching previous research, it underlines that the need to develop competencies is attributed to the other group.

## **5 Discussion**

Overall, employees and managers recognize the relevance of diversity in today's organisations. This feeling is, however, stronger expressed in the group of

employees. In the interviews, managers were mostly talking about the importance of diversity measures for the success of the organisation, as well as justice and fairness for employees. Nevertheless, they viewed this issue as important in the future, not in the present. They did not see the present need to act and were not aware enough of the level of stress concerning the diversity change of both employees with and without an immigration background. However, leaders understood the seriousness of the topic of diversity but did not see the urgency regarding cultural diversity and equal opportunities of people with an immigration background. In addition, human resource managers were not able to assess the additional stress of migrants precisely and to consider them sufficiently in their daily management.

Employees were aware of the importance of diversity. Those without an immigration background had difficulties recognising how important individual actions regarding equal opportunities of people with and without immigration background are. However, they assessed the level of stress of employees with an immigration background well. They also spoke and were aware of the risk that diversity is problematized. Concerning attitudes regarding diversity, differences within Germany became obvious. In western Germany, for example the Ruhr-region there is a high proportion of migrants, there it is seen as normal to work in a highly diverse cultural environment.

Intercultural and social competence makes up an important part of diversity competence. Participants mentioned empathy, tolerance and communication competences, openness, self-reflection, and emotional competences as well as cultural knowledge and awareness. Both groups, employees and managers pointed out that employees and managers both should receive more support in order to strengthen relevant competences. Proposed measures for this were trainings and gaining experiences abroad. This stands in contrast to the findings that managers and employees did not express significant differences regarding the subjectively assessed social competence. Additionally, their self-assessment was very high, even though the qualitative questionnaire classified it only as high.

Limitations to this study should also be mentioned. Issues of ageing employees and diversity measures regarding this target group were partly dealt with superficially in the conducted interviews. However, it is possible to differentiate from the sample due to other characteristics, e.g., size, structure, implementation of a diversity department. Based on the findings the interview guideline should be extended, also to investigate the quality criteria of the category systems. Also, the

finding that there is a regional difference concerning the importance of diversity measures in Germany must be viewed critically, as the interviewed persons have answered the questions differently detailed.

A positive aspect is that the sample had a relatively high diversification so that the different aspects of diversity could be seen from different perspectives by employees and managers, developing diversity strategies for their companies. It can also be positively highlighted that the interview guideline covered various issues regarding diversity management and by asking open and closed questions, the comparability of the interviews was increased. However, results of structured interviews are less comparable, inter alia because of the open questions that make the analysis more difficult. The whole topic of diversity, especially equal opportunities of persons with an immigration background has rarely been investigated making the explorative approach crucial to generate hypotheses and perspectives for future research. Limitations to the diverse sample also exist. Results of the interviews could only measure equal opportunities of people with an immigration background and ageing people. It is necessary to involve managers from different working fields, locations in Germany and other small, medium-sized, and large organisations in the study to create a representative sample. The results of this study were used to generate a new questionnaire. Additional aspects regarding equal opportunities of persons with an immigration background could be measured. These aspects could not be asked in detail in conventional quantitative surveys. The newly generated questionnaire could focus stronger on the urgency of diversity. Social desirability is also a problematic aspect that should be mentioned as the used survey method were interviews. Deliberate misinterpretations are not likely to happen because the respondents participated voluntarily and had not to expect any sanctions or other negative consequences that could arise from specific statements. The phenomenon of social desirability could be minimised by anonymizing the data. However, it could still appear because of the social interaction in the interviews. A consequence could be that results distort because e.g., the individual responsibility or the skills were presented in a more positive way by the questioned participant.

To summarize, the study at hand underlined that it is important to integrate diversity principles more in the manager and company guidelines. People with responsibilities should be trained more in the topic of diversity so that they can diagnose the need of diversity correctly and can implement effective measures now and not in the future.

### Abstract

Insights into emergence and influence of cultural diversity are becoming more important, due to an ongoing upward trend towards diversified societies. Yet, there is little scientific evidence on the specific attitudes of managers regarding cultural diversity, especially for technical and scientific professions. The present qualitative study examined the experiences, social influences, and competencies of managers in the STEM sector, which are important for managing cultural diversity. The results show that only a few of the respondents were aware of the opportunities and risks of cultural diversity and the specific challenges for people with a migration background. Furthermore, the respondents' own experiences and sensitivity, their own identification with the company and previous diversity measures in the context of the companies' position seemed to be relevant for the formation of attitudes. The respondents also stated a lack of interpersonal and intercultural competencies among junior managers, which should be addressed by both companies and educational institutions.

## **1 Diversity Attitudes of STEM-Executives**

Structures that are characterized by a high degree of heterogeneity among their members are more successful when they succeed in utilizing the diversity of competencies and perspectives (van Dick and Stegmann, 2016). This is the goal of the approaches and methods summarized under the term diversity management. Studies revealed that organization members' diversity beliefs (attitudes towards the functionality of diversity) predict whether organizations utilize or waste the potential of their members. Teams with positive diversity beliefs have been shown to react more positively to the perception of diversity within the team, experience less threat based on the heterogeneity, tend to discrimination practices less and be more able to share relevant knowledge (van Dick & Stegmann, 2016). Individual diversity beliefs are strongly influenced by the exemplified corporate culture and leaders' attitudes towards cultural diversity (Genkova, P. and Ringeisen, T., 2016; Guimond et al., 2013). However, many German companies exhibit a rather monocultural or pluralistic corporate culture (Cox, 1991), in which heterogeneity, especially with regard to cultural diversity, is understood as a disruptive factor, or economic disadvantage (Baporikar, 2021; Cox, 1991). On the one hand, this goes hand in hand with disadvantages for persons with diversity characteristics, and on the other hand, it can mean a loss of potential for the respective organization (Barmeyer et al., 2019). At the same time, the German labor market faces a shortage of skilled workers in academic professions in the fields of medicine, engineering in mechanical and automotive engineering, electrical engineering, IT, and software development and -programming (Bundesministerium für Wirtschaft und Energie, 2020), not completely but most of which are based in the STEM (Science, technology, engineering, and mathematics) sector. According to the Institute of the German Economy, the STEM sector is characterized by a high level of international mobility and a high proportion (19%) of foreign experts in German companies (Anger et al., 2018). While there is no data on the share of second and third generation migrants in the STEM sector available, the 26% of the German population currently has a migration background, i.e., they are immigrants themselves or have at least one parent who is an immigrant. Around half of this 26% of the German population are second and third generation migrants (Bundeszentrale für politische Bildung, 2020; Kemper, 2010). Consequently, diversity management is becoming increasingly important to prepare employees and managers for the challenges of dealing with

cultural diversity in their daily working life. In recent years, research has been able to present comprehensive findings on the establishment of diversity management in organizations (Ashikali and Groeneveld, 2015; Auferkorte-Michaelis and Linde, 2016; Genkova, P. and Ringeisen, 2016). In particular, they examined the ways in which intercultural and social competencies can be fostered among employees and which leadership behaviors are useful for diversity management. In their conference paper on the perception of aspects of cultural diversity, Genkova and Schreiber (2019) emphasize that managers play a crucial role in the implementation of diversity management. While the top management should develop a general strategy and public position, senior and middle managers are required to exemplify this strategy, for example, by demonstrating openness and flexibility (Franken, 2015; Wildermuth and Gray, 2005). At the same time, there is a lack of evidence on what attitudes towards cultural diversity exist among managers and how they develop, or even change. Leaders who communicate and live the strategy of diversity management are treated as information brokers in research, without addressing which experiences, influences, and information are relevant for their attitudes. In particular, technical and scientific leaders are under-researched while effective diversity management is neither established in curricula (Koller & Rudolph, 2017), nor in professional life in the STEM sector (Anger et al., 2018). For this reason, the present study took an exploratory look at the attitudes, experiences, competencies, and social environment of STEM leaders. The aim is to contribute to a better understanding of the development of diversity attitudes among leaders in general, while also highlighting opportunities and risks for diversity management practices in the STEM sector.

### ***1.1 Cultural Diversity, Identity, and Performance***

Thomas (2003) describes culture as a psychological orientation system that defines the belonging of its members through perceptions, thoughts, and actions. Culture is an aspect of an individual's social identity and is used to categorize one self and others. The social-identity approach (Tajfel and Turner, 1979) explains that the perception of identity varies on a spectrum between individual and social identity. The latter means identification by belonging to one or more groups. The moment one of these groups becomes more salient, or subjectively relevant, people tend to view themselves and others less as individuals and more as representatives of a single group (Hogg, 2016). The salience of the existence of

social groups is thus associated with a greater emphasis on subjectively perceived differences between groups and less individual differences within groups (Tajfel and Turner, 1979).

The Categorization-Elaboration Model (CEM, van Knippenberg et al., 2004) was the first model to explain differences in performance across diverse teams in a replicable way, based on the social-identity approach (van Dick & Stegmann, 2016). The core assumption of the CEM model is that groups with diverse members have a higher potential in terms of perspective, knowledge, or information when working efficiently with appropriate subgroups. Thus, information diversity should lead to deeper information collaboration, i.e., greater engagement with this information. Van Knippenberg et al. show convincingly that the categorization of team-members based on diverse characteristics might be connected to the perception of threat. Individuals tend to feel threatened by diversity, if they are convinced that the heterogeneity is disadvantaging the group performance (van Knippenberg et al., 2004), which is detrimental to individual as well as group performance (van Dick & Stegmann, 2016). If diversity is perceived in a negative way, team members might tend to form more homogenous subgroups. Subgrouping leads to negative affective consequences and consequently to poorer performance if the subgroups have an adversarial relationship with each other. According to the model, this occurs when the subgroups do not recognize each other or their respective contributions, i.e., when their identities are threatened (van Dick & Stegmann, 2016). In summary, the model states that any kind of diversity can contribute to the performance of a group. Van Knippenberg et al. (2004) further argue that the ability and the motivation of the team members influence the team performance. Thus, diverse teams are more successful, if they do not see diversity as a threat but are able and willing to utilize the potential of diverse competences and perspectives.

## **1.2 Diversity Management**

It becomes clear that cultural diversity holds both opportunities and risks for companies. Cultural diversity is an unavoidable factor in and around organizations in Germany, where the proportion of people with a migration background is just over a quarter of the population (Bundeszentrale für politische Bildung, 2020). In an overview chapter, van Dick and Stegmann (2016) describe that consequently the challenge for modern diverse teams and societies is not the diversity of their

members per se, nor the inevitable subjective relevance of differences, or Faultline's, between subgroups. The most important task of diversity management is rather to replace any threatening relationship between groups with a productive and meaningful relationship (van Dick & Stegmann, 2016).

One of the key goals of diversity management is thus strengthening an overarching identity that increases cohesion and commitment (van Knippenberg & Schie, 2000). Based on the self-group projection hypothesis (Mummendey & Wenzel, 1999), this also requires an awareness that the superordinate group, team, or organization is not culturally homogeneous, but becomes what it is only through the multiplicity of different perspectives (Reese et al., 2012; Waldzus et al., 2003). Accordingly, Gutentag et al. (2018) describe that the foundation for diversity-sensitive behavior is a nuanced awareness of cultural diversity of companies, as well as individuals. This runs on a spectrum between the perspectives culture-blind (assumption that there are no cultural differences, all people are the same) and color-full (consideration of cultural differences, Cox, 1991). In addition, individual attitudes towards diversity are critical. The term diversity beliefs was originally introduced by Van Knippenberg and Haslam to describe individual beliefs that diversity is beneficial to a group. They argue that this leads to diversity being perceived as something positive and thus to a stronger identification with the diversity of the superordinate group (van Knippenberg & Haslam, 2003). Diversity becomes a group characteristic, so to speak, with which one distinguishes oneself positively from other groups (van Dick & Stegmann, 2016).

The current literature in diversity management comprehensively presents how attitudes towards cultural diversity among employees are influenced by managerial behaviors (Choi and Rainey, 2014; Genkova, 2019; Moynihan et al., 2012). Ashikali and Groeneveld (2015) conducted a very large study with over ten thousand participants and showed that employees' perceptions of culturally fair selection procedures, perceptions of appreciation, and conscious competent management of cultural diversity were significantly positively related to diversity attitudes as well as to the commitment of the respective employees. This relationship was partially mediated by a transformational leadership style (Ashikali and Groeneveld, 2015). They explain that employees in general, and with a transformational leadership style in particular, adopted leaders attitudes and behaviors as norms and standards for evaluation and acting. They adopted / developed a diversity culture (Schein, 2010). Diversity culture, as a socially shared

set of opinions and behaviors (Schein, 2010) regarding the assessment of and handling of (in this case cultural) diversity, further has been shown to be a key predictor of the performance of heterogeneous work groups (e.g. Kundu and Mor, 2017, Stegmann, 2011). Summarized, the literatures shows that today's managers are faced with the tension of understanding the context and relevance of diversity management, developing sensitivity, and possibly leaving behind their own animosities and insecurities, while also taking into account their managerial and professional tasks (Ashikali and Groeneveld, 2015; Genkova, 2019; McCallaghan et al., 2020).

### **1.3 The Present Study**

While managerial behaviors can be studied relatively easily by interviewing employees, there have been very few studies dedicated to the attitudes and perspectives of managers, even though, they can be understood as multipliers of successful diversity management. In a qualitative study, Genkova and Schreiber (2019) compared how managers and employees from DAX companies assessed diversity management in their own organization. They showed that executives are often not aware of the shortcomings their employees see in their diversity management. Rather, the interviewed executives considered fair personnel selection and addressing their own prejudices to be tasks for the future, after subjectively more current tasks will have been dealt with. Auferkorte-Michaelis and Linde (2018) emphasize that a confrontation with one's own prejudices and one's own perception of diversity was most likely to happen during college, or even earlier. Especially in (German) STEM departments such topics are still hardly widespread (aside from the issue of promoting women in STEM professions), although other departments (social sciences, economics) have already established the topics diversity and leadership for a longer time (Auferkorte-Michaelis and Linde, 2016, Koller & Rudolph, 2017). Besides the lacking attention for diversity among STEM departments, the report of the STEM Employers Association neither sees cultural diversity as the challenge that it is. The report expresses optimism due to the high number of foreign experts, without addressing an efficient handling of cultural diversity (Anger et al., 2018). Considering the high international mobility, globalized markets and the high degree of international experts in the German STEM sector, the question remains important how leading staff perceives the situation of diversity management in the STEM sector.

The aim of this study was to contribute to a better understanding of attitudes towards cultural diversity among managers in STEM professions. For this purpose we explored which attitudes towards cultural diversity exist among the interviewed managers. Research on diversity management from a social psychological perspective considered experiences that shape people's attitudes, social influences and the surrounding diversity culture, as well as competencies that can be helpful for dealing with diversity (Genkova, P. & Ringeisen, T., 2016). Thereby, we aimed to identify potential for action and research regarding leaders' approaches to cultural diversity by examining experiences, social circumstances, and competencies that appear to be particularly relevant to their respective attitudes towards cultural diversity. The following guiding questions were formulated:

- What are the attitudes towards cultural diversity among the interviewed STEM leaders?
- What experiences are particularly relevant to attitudes towards cultural diversity among STEM leaders?
- What attitudes and perspectives in the social environment of STEM leaders are particularly relevant to their attitudes towards cultural diversity?
- What competencies and know-how do STEM leaders have that are particularly relevant to attitudes towards cultural diversity?

## **2 Method**

Since there are hardly any findings from empirical research for this specific field, a qualitative, explorative approach was used. The structured interviews were intended to provide a holistic picture of the subjective theories (Hilmer 1969) of STEM executives on diversity attitudes and intercultural competence. The interview guide contained a total of 58 questions. Of these, five were closed-ended self and peer-assessment questions. The guide was structured based on the topic areas of cultural diversity, personnel selection and assessment, leadership, stress, faultlines, and communication. The topic areas were derived on the basis of the theoretical considerations presented and taking into account practical experience with regard to the areas of everyday work of managers in Germany in which points of contact with cultural diversity exist. In order to ensure conceptual equivalence and comparability (Genkova 2019) across subgroups

(managers with and without a migration background, with a lot of experience and with little experience), the finalized interview guide was discussed by several diversity experts with and without migration background and approved after minor changes regarding general formulations.

### **2.1 Procedure**

The interviews took place between January and March 2020. Through academic and business networks, executives from various companies who hold degrees in STEM subjects and work in the field were recruited for the telephone interviews. In accordance with data protection guidelines, explicit consent was obtained for the interviews to be recorded and used for exclusively scientific purposes. The interviews took between 20 and 45 minutes. There were no incentives given.

The recorded interviews were transcribed and inductively analyzed using qualitative content analysis according to Mayring (2015). This methodological procedure has the advantage of allowing both qualitative and quantitative analyses and a great depth of interpretation (Bengtsson 2016, Krippendorf 2004). Subsequently, the category formation was discussed with three diversity experts from universities to ensure better objectivity as a basis for interpretation. This is in line with a triangulation approach suggested by Bengtsson (2016).

### **2.2 Participants**

A total of 22 executives from various German companies were interviewed. The respondents were between 26 and 69 years old ( $M = 49$ ). Three of the respondents were female, 19 were male. All respondents had a university degree in a STEM subject. Three of the respondents had a migration background (as defined by Kemper, 2010, according to which people who themselves, or for whom at least one parent, immigrated to Germany are counted as having a migration background). About half of the respondents were located in urban and half in rural regions, but most were in northern Germany (one person each lived in Stuttgart and Passau). Ten respondents classified themselves at the middle management level, twelve at the upper management level. Five respondents (23%) said they worked in a small company (up to 50 employees), eight (36%) said they worked in a medium-sized company (up to 250 employees), and nine (41%) said they worked in a large company with more than 250 employees. Eight

participants were working in the IT and software sector. Six were in building, civil, or plant engineering, two in steel and building materials production, two in consulting, and one each in automotive, energy, wood processing, and food. The managers estimated the proportion of people with an immigrant background in their company at 17.5% on average. Table 1 shows the proportions grouped by company size.

Table 1 Estimated share of people with a migration background in companies by size.

		People with a migration background			Total
		< 10%	< 30%	> 30%	
Company size	Small	2	2	1	5
	Medium	3	3	2	8
	Large	2	5	2	9
Total		7	10	5	22

### 3. Results

#### ***3.1 What are the Attitudes Towards Cultural Diversity Among the Interviewed STEM Executives?***

In order to answer the question of what attitudes towards cultural diversity are generally presented among the interviewed executives, various sequential questions were asked to reveal perceived and suspected advantages and disadvantages of cultural diversity in companies. Sixteen of the 22 participants said they saw an advantage in cultural diversity, while six saw neither an advantage nor a disadvantage. Table 2 presents the reasons for perceived advantages and disadvantages that executives expressed. It can be seen that individual respondents gave multiple, differentiated answers (for example: "Salespeople with a migration background may be well suited for sales in the respective country, but within teams, the additional perspectives in particular can be enriching", translated by the author), while nine of the 16 remaining respondents gave no or very brief answers at all. Among participants, there seemed to be a strong desire to present issues clearly and directly. A topic was rarely covered at length of time; rather, uncertainty was evident in short, choppy responses that tended to address general positions, sometimes combined with a

request to continue the interview. (e.g., "Uhm, diversity brings advantages (...) Especially in project work. Next Question!", translated by the author).

Table 2 Advantages of cultural diversity from the perspective of the interviewed executives

Do you see cultural diversity in your company as an advantage, a disadvantage, or neither? Please justify your statement briefly.	
Category	Count
Other perspectives	5
More efficient work	2
Additional competences	2
Other languages	1
Motivation to work	1
Diversity in the team increased openness in general	1
Other way of working	1
Promotes integration in Germany	1
Mutual learning	1
Interaction with partners	1
Intercultural competence	1
No grouping	1
Access to other markets	1

It was striking that 17 of the executives interviewed expressed the opinion that "everyone is equal" several times. In six cases participants emphasized that special importance is therefore attached to treating everyone equally. Therefore, no special measures were taken to support cultural diversity and equality. This attitude was reflected in the question as to whether diversity management measures have already been established ("What has been done in your company to support cultural diversity or to create equal conditions for all? - Just as little, everyone is equal", translated by the author). Similar answers occurred on questions about whether personnel selection procedures are designed fairly, whether employees with a migration background need different working conditions to work effectively than those without a migration background, and in the question about whether employees with a migration background behave differently in personnel interviews.

A separate questionnaire section asked about the perception of fault lines among employees. Twelve of the managers stated that they think that persons

with a migration background get along best with other persons with a migration background. However, only one of the respondents would allow shared, separate office spaces. Five of the respondents' reported feeling that there are informal cultural group spokespersons in their company. In terms of perceptions, it was also apparent that many of the managers surveyed do not see people with a migration background as part of the same hierarchical level. For example, they emphasized that problems of intercultural interaction in their company occur primarily among warehouse employees and truck drivers. In all cases, these 12 managers also believed that the most important skill for people with a migration background in their company is knowledge of the German language.

In contrast, seven of the executives believed that people with a migration background are more willing to perform or more disciplined than people without a migration background. In most cases, this seemed to be based on the attitude that people who have enjoyed the amenities of Western society less or for a shorter time work more conscientiously. This was illustrated by the very succinct phrase: "Yes, there are differences. And that certainly has to do with how one grew up and under what circumstances one grew up. If someone who has had cannonballs flying around his head is certainly different than someone who grew up well protected here in the west of the republic."

Six of the surveyed executives presented a nuanced picture of the benefits and risks of cultural diversity in their companies. They believed that the challenges and stress levels of employees with a migration background differ and describe both opportunities and risks for people with a migration background. Three of them have a migration background themselves (in two cases with parents from Poland, in one with parents from Turkey). Managers with a migration background showed similar attitudes as the managers without a migration background if the latter were aware of different challenges and issues for people with and without a first-generation migration background. They seemed to have a strong awareness of divergent requirements. At the same time, all of the interviewed migrant executives exhibited the attitude that you can't go wrong if you treat everyone the same. They were not aware of the possibility to actively influence the diversity culture, just like most of the other respondents.

Apparently, there were very different attitudes towards cultural diversity among the STEM leaders surveyed. At the same time, parallels emerged between the participants' responses that can help to understand the complex

interrelationships that may be relevant to the development of the attitudes described.

### ***3.2 What Experiences are Particularly Relevant to STEM Leaders' Attitudes Towards Cultural Diversity?***

During the interviews, the respondents expressed various experiences that seem to have shaped their views on intercultural interactions and cultural diversity. First, one could observe a difference between the attitudes of those managers who work a lot with international partners, customers, or colleagues and those who do not. Those who do a lot of international work, especially the executives from the IT sector and from the particularly large companies, had a culture-blind attitude in many cases, but at the same time had concrete action strategies for dealing with cultural diversity. These eight respondents with many international contacts were very focused on the interaction with foreigners, while second generation migrants played a subordinate role, but they could answer very concretely and self-confidently when it came to which characteristics are necessary to act, communicate, or lead successfully in intercultural settings. While they emphasized the need to speak a common language, they assumed that in most cases everyone involved can speak English.

Those executives who interacted little with international contacts or others with a migration background in their daily work (although the company may well serve international markets) and did not themselves have a migration background showed a significantly more negative attitude towards cultural diversity. This was evident in response to questions about whether diversity is an advantage, what working conditions people with a migration background need, and what culturally fair HR- and management methods have been introduced. All 12 managers who had the impression that cultural subgroups have formed in their companies have very little to do with people with a migration background in their personal day-to-day work. At the same time, these executives were less certain about what intercultural leadership requires and what people with and without a migration background can do to interact successfully. Again, the most common answer given was a common language base and the assumption that people with a migration background should learn German in any case. This is even more striking among those who believed that informal opinion leaders have formed in the cultural subgroups in their companies.

It is also striking that ten of the respondent's stated that it is not possible to communicate easily in German with everyone in the company. These managers either came from IT and had immigrants in their team or came from large companies. At the same time, 17 of the respondent's stated that language courses are particularly important for people with a migration background. For those who did not have frequent contact with people who speak other languages, the conclusion was that their own negative attitude was linked to arguments that were rationally justified and should appear to be in the interest of the company. It happened several times that one's own negative attitudes were presented as attitudes of the company, or of the board of directors: "Yes, well, I say once, in the management levels would certainly not be accepted here in the house if all of a sudden the carpet is aligned to Mecca. That is not acceptable to a German family business, German-led, from the management, so: they would never do that."

Regarding the experiences of managers and the connections with attitudes towards cultural diversity, it appeared that especially managers of small and medium-sized companies had negative attitudes towards cultural diversity in many cases, but above all had rarely have any direct experience with people with a migration background. Consequently, there seemed to be no knowledge about actual problems of integration or discrimination. The responsibility for known problems, for example language problems, was shifted to the people with a migration background ([we don't need to support them,] "they can go to night school or something") and there was no knowledge about what one could do differently or better oneself.

For the larger companies and the IT employees, the picture was more differentiated. The larger companies had both international contacts and a higher proportion of people with a migration background in their own ranks. In addition, larger companies in this survey were more likely to have a compliance agreement or corporate policy that explicitly addresses diversity. Most of the executives who work in large companies showed a more positive attitude towards cultural diversity, were able to give more concrete accounts of what is necessary for intercultural leadership and the extent to which optimal working conditions differ for people with an immigrant background.

The eight managers from the IT sector seemed to belong to a third pattern. They had predominantly positive attitudes towards international cooperation and reported working regularly with partners of various cultural backgrounds abroad. While there was a lot of experience, this did not seem to have led to a colorful

perspective in any case. The focus was less on understanding intercultural differences and more on avoiding unintentional intercultural friction. To this end, in three cases an agile way of working and the Scrum framework was also mentioned, which provides for equal treatment of all team members. Agile working summarizes an extremely popular set of methodological frameworks that, based on the so-called Agile Manifesto according to Beck et al. (2001), aim to enable efficient and flexible project management in the context of VUCA (Schwaber & Sutherland, 2020). However, there seems to be no awareness of issues related to proactively dealing with cultural diversity within organizations, such as integration or avoiding discrimination connected to the application of an agile framework.

The experiences that individual managers have had, or have not had, with individuals with migration backgrounds seem to provide explanations for existing attitudes among respondents. At the same time, it seems as if STEM executives deal with people with a migration background in a professional context less as individuals and more as representatives of the company or team. From this perspective, it becomes clear that the respective experiences and their interpretations are influenced by an interaction from the perceived corporate culture and the individual attitudes of the executives.

### ***3.3 Which Attitudes and Perspectives in the Social Environment are Particularly Relevant for STEM Leaders' Attitudes Towards Cultural Diversity?***

As described earlier, executives seemed to have more negative attitudes towards people with a migration background if they interact little with them and had no previous international experiences. This also seemed to be accompanied by perceptions of Faultline's and cultural subgroups within the company.

In the questions about personnel selection and assessment and leadership, there were indications that the respondents acted predominantly as representatives of the respective company. All but two of the managers argued from the company's perspective when it came to personnel decisions (e.g., "We haven't done that much yet; So, anyone can come to us") or, for example, how to deal with mistakes (e.g., "This is how we handle it"). They seemed to identify very strongly with their companies, which may also be due to the context of the survey. However, this became striking the more often indications of strong

identification occurred and the more the managers seemed to see themselves as typical representatives of the company, especially regarding the cultural background. In the small and medium-sized companies studied, personnel selection was primarily based on sympathy and team skills. At the same time, it became apparent that deviations, especially cultural deviations, were viewed very critically when identification was high. This became particularly clear with the following example:

"According to which criteria, apart from professional suitability, do you select your academic employees?" "Uhm yes, definitely German language, language quality (...) spoken and written, very important. EDP also means communication, and these are not just any tasks that have to be done in the back room, but you must be able to talk to people and communicate. And we are a German family business, so yes, I would say that we are actually very limited locally. We do have subsidiaries in France and in Poland, but even there German is definitely spoken at the management positions."

No such self-group projection was observed among the four respondents who see cultural diversity not only as an abstract advantage but as a concrete strength of their own company. While personnel selection processes are not always structured, these respondents did not indicate that they perceive Faultline's in the workforce. This was also true for those managers who had a culture-blind perspective, but either had a very culturally diverse workforce, or interact a lot internationally.

In addition to size, however, the attitude of the company also seemed to play a role. Among the managers who had a more positive and differentiated view of cultural diversity and intercultural communication, in six cases the company took a supportive role with regard to diversity and helped create appropriate conditions. Table 3 shows examples of the measures taken in the companies depending on whether the respondents could give specific reasons why cultural diversity was an advantage for the company. As can be seen, those who already had experienced more activities on the part of the companies had a more differentiated idea of why a company should take measures that support cultural diversity and equal opportunities.

Table 3 Categories to the question "What has been done in your company to support cultural diversity, or to create equal conditions for all?" depending on whether respondents cite reasons why diversity is an advantage.

<b>Was there a reason given?</b>	<b>Measures taken by the company</b>	<b>Count</b>
No	<i>total</i>	8

	Cooperation with school	1
	Quotas	1
	Language courses	1

In addition to a generally positive attitude towards cultural diversity and a differentiated view of cultural diversity, concrete knowledge about the opportunities and risks of intercultural interaction and, above all, about leadership qualities in intercultural situations was repeatedly considered as an indicator of efficient handling of cultural diversity. In the following, it will be shown once again in a more detailed ways which competencies and which know-how was available among the respondents and which problems and needs were seen.

### **3.4 What Competencies and Know-How Exist Among STEM Leaders and are Particularly Relevant for Attitudes Towards Cultural Diversity.**

Overall, the respondents showed a heterogeneous picture of competencies that are necessary for intercultural leadership. As already explained, managers who see diversity as a strength of the company have already experienced various diversity management measures. Moreover, they usually work in companies,

where there is international interaction, so employees have a better understanding of how to deal with cultural diversity. The managers with a migration background did not differ in their response behavior from managers without a migration background. Although they were more sensitive than most other respondents, but they did not necessarily seem to think about the issue in a more differentiated way. Table 4 shows which leadership characteristics the respondents consider particularly important for leading intercultural:

Table 4 Qualities for leading intercultural teams

In your opinion, what characteristics do managers need to have in order to lead employees in an intercultural competent manner?	
Category	Count
Openness	9
Cultural knowledge	6
Diversity awareness	4
Empathy	3
Impartiality	3
Appreciation	3
Emotional intelligence	2
Respect	2
Flexibility	2
Leadership personality	2
Intercultural competence	1
Communication competence	1
Diversity sensitivity	1
Honesty	1
Sensitivity	1
Language skills	1
Own migration experiences	1
Build trust	1

Except for one respondent, the managers were convinced that they are good at intercultural leadership and are sufficiently sensitive to their employees. However, about half of the respondents (11) pointed out that junior managers often have problems in this area. Five respondents explicitly pointed out that this should be taught in university:

"More tools, more training. I also said at the beginning that leadership is virtually non-existent at university, at least I didn't have it as a subject choice at

all, not even as a compulsory elective. And I get that reflected from others as well. And when I think about the things I've learned in recent years, take Friedemann Schulz von Thun, his peer one model, or the different levels of communication and so on and so forth, all of these are actually basics, really basics, that you would normally have to pack into, let's say, the fifth to tenth grade. Because that is simply incredibly important for further progress. And leadership just must be part in the universities, and it has to be one of the most important subjects, because you're dealing with people afterwards, everywhere."

Those who particularly emphasized this point during the interviews had completed various "soft-skills" trainings themselves, either on their own initiative or through the company. Among the managers for whom this was not the case, there was often also little awareness that employees and managers can be prepared for intercultural leadership. None of the managers with a migration background have ever participated in such training, which may also be an explanation for the culture-blind perspective of these managers. This may also be related to the fact that in small and medium-sized companies in particular, the relevant competencies were generally not available, so that corresponding training courses were not even initiated.

#### **4 Discussion**

Previous studies have shown that the implementation of diversity management primarily follows a top-down process (Genkova & Schreiber, 2019; Auferkorte-Michaelis & Linde, 2018). In this process, diversity strategies of corporate management are passed on from managers to employees. This study highlights that senior and middle managers should not only be considered in this sandwich position, but that the development and promotion of diversity attitudes and action strategies, especially in STEM, requires special attention.

The results show that only a small proportion of respondents were aware of the opportunities and risks of cultural diversity and the specific challenges for people with an immigrant background. In this context, both the respondents' own experiences and sensitivity as well as the company's position and previous measures seemed to be relevant for attitudes towards cultural diversity and the interaction with each other. For example, different patterns emerged among respondents depending on how much or little they interacted with people with a migration background in their working life, the extent to which they identified

with their company, and whether or not they saw diversity as a concrete advantage. In addition, those whose companies had established diversity measures showed different and more nuanced attitudes towards cultural diversity.

Those managers who worked little with people with a migration background because the number of people with a migration background in the company is low or the company does not operate internationally showed little concrete competence in dealing with cultural diversity, were not very sensitive to challenges for people with a migration background and at the same time tended to represent a culture-blind perspective. By saying that all people are equal, they justified why diversity is important and that they treated everyone equally at the same time. This result was consistent with the findings presented by Genkova and Schreiber (2019). They showed that, on the one hand, low contact with a subjective foreign group was more likely to lead to negative attitudes towards that group, which is consistent with the contact hypothesis (Allport et al., 1954). Those managers who showed negative attitudes also believed that applicants should speak German to belong to the organization. Pehrson et al. (2009) showed in a cross-sectional study that the relationship between national identity and prejudice against foreigners was stronger when nationality was defined by ethnicity or language, compared to when nationality was defined by citizenship. In this study, it was not possible to differentiate whether the reservations about the language ability of people with a migration background relate to the national identity of the respondents, or to their identity as members of the company. However, the fact that the individuals spoke from a company perspective and presented reservations they themselves have as reservations of the company suggests that identification with the company can also lead to more negative and undifferentiated attitudes towards individuals with a migration background if the German language is perceived as a relevant part of the corporate culture. Future studies should verify this using larger samples.

Those who had contact with people from a migrant background were not necessarily more sensitive to people with a migrant background or more competent in dealing with them. Even people who often interacted with people from other cultures in their daily work environment, such as IT workers, tended to lack awareness of cultural differences. However, this awareness was present if measures have already been implemented to support diversity. It stands to reason that when companies are clearly positioned "pro diversity" and identification with the company is high, positive, and differentiated attitudes were more likely to be

adopted, which would be consistent with the findings of Ashikali and Groeneveld (2015) and the meta-study by Lee et al. (2015). In the case of high identification and lack of, or negative positioning of the company, there was always talk of "them" when it came to people with a migration background. People with a migration background were perceived as external to the organization or team, although a certain proportion of employees in the respective companies have a migration background. Following Mummendey and Wenzel (1999), this assessment can be traced back to the self-group projection hypothesis, which states that individuals experience a superordinate group, such as a company, as more homogeneous and similar to themselves than it actually is (Ehrke & Steffens, 2015). Prototypical of this is the statement: 'everyone is the same', which in the present study seemed to mean, on the one hand: I treat everyone the same, but at the same time: we are all the same, everyone is like me.

Nevertheless, some respondents seemed to have a lot of intercultural experience, i.e., managers with a migration background. Although they were in favor of equal opportunities for obvious reasons and were sensitive to discrimination, at the same time all three of them felt that cultural differences were better neglected and that they should "concentrate on the essentials." In other words, they understood cultural diversity as a social contextual factor that could not be avoided, but also did not add any significant value, except perhaps being able to target foreign markets. This perspective was also found by Gutentag et al. (2018) when examining attitudes towards cultural diversity, showing that on the one hand prejudice and xenophobia can be reasons for culture-blindness, but also the feeling of being overwhelmed by the complexity of the topic. This being overwhelmed was also evident among some of the managers interviewed, but it did not seem to have led to negative attitudes towards cultural diversity as in Gutentag et al. (2018), but rather to a trivialization of the topic, although potential problems may well be known, for example, to managers with migration background.

Against the backdrop that a differentiated discussion of the complex problems of cultural diversity tended to be avoided, it can also be concluded that executives were more likely to give the topic of cultural diversity time and attention if it is anchored in the corporate identity. Conversely, this would mean that managers, as well as employees, may disseminated a negative diversity culture as much as a positive one if they identified particularly strongly with the company and depending on whether they personally considered the issue

relevant. Future studies would do best to examine this relationship using a quasi-experimental longitudinal study.

This relationship between company positioning, further training opportunities and experience of competence was also supported by the fact that those managers who were more aware of the issues and challenges were also more likely to believe that leadership in general and intercultural leadership required special training or further training, which can only be partially substituted by experience. It was emphasized that junior executives often do not meet the requirements of intercultural leadership and go through a not unproblematic try-and-error process until they have reached a level at which they can work without interference. This is also in line with Barmeyer et al. (2019). Auferkorte-Michaelis and Linde (2018), generally called for diversity to be more firmly anchored as a topic in teaching. There are currently no specific (accessible) studies on this for the STEM world of work, but diversity and leadership currently receive little to no attention in the curricula of most STEM subjects, whose students are the STEM leaders of tomorrow (Koller & Rudolph, 2017). Therefore, a key finding of this study was that greater consideration of cultural diversity is needed from both the corporate and university sides to meet the demands of a culturally heterogeneous society.

The interviews further revealed that some of the IT professionals identified very strongly with the concept of agile working. The concept of Agile Work is rooted primarily in the field of computer science, but is established in other areas of project-based work worldwide (Pusenius, 2019). McCallaghan et al. (2020) demonstrated through a cross-sectional study that servant leadership, a core concept of agile work, was positively related to employee diversity attitudes. However, they also pointed out that they operationalized diversity attitudes only as an instrumental component (i.e., whether respondents believe diversity represents a business advantage) and did not capture diversity sensitivity. Similar to Ashikali and Groeneveld (2015), they showed that employee-oriented leadership behaviors were more likely to be related to employees' open attitudes. The results of this study implied that a co-employee-oriented leadership style allows the leader to pass on their attitudes which can have advantages and disadvantages. On the one hand, equality is firmly embedded in both agile frameworks and transformational leadership styles (Kearney & Gebert, 2009; Pusenius, 2019). On the other hand, neither concept addresses other facets of diversity management, such as prejudices, discriminating structures or cross-

cultural differences. The IT leaders who described their leadership style as agile emphasized equality but did not have in-depth knowledge or awareness of the opportunities and risks of cultural diversity. Although the other mechanisms outlined in this paper could also be at work for this attitude, a connection seems obvious and further studies should address a link between agile methods and diversity attitudes, especially given the increasing prevalence of agile ways of working.

## **5 Limitations**

The present study has some limitations. The sample was very small and transferability of results should be investigated for other STEM executives. Women and men showed no differences in response behaviour, but a separate consideration of possible correlations between attitudes and experiences was not made. However, very few women were interviewed, so the external validity of the results here must be considered severely limited. Although the perspectives of managers with a migration background were considered separately. Very few leaders with migration background have been interviewed. Future studies should take a closer look at this topic and specifically address women and people of diverse genders, as well as people with a migration background, also to consider possible effects due to intersectionality, which could not be investigated in this study. The structured interviews generated a differentiated picture of respondents' attitudes towards cultural diversity, but for further studies it would be useful to query not only advantages, but also disadvantages. Some respondents apparently interpreted the question of whether and why cultural diversity was an advantage or disadvantage to mean that they should only provide arguments about advantages or disadvantages, which may have led to less differentiated responses, despite asking. In addition, further studies of this kind should not only ask for perspectives and opinions, but also reline these with situational questions. While some respondents supported their discussions with many examples, others were very reticent, especially about negative experiences.

## **6 Conclusion**

Despite the aforementioned limitations, the present study was able to identify relevant connections for further research in the field of diversity and diversity management. It should be particularly emphasized that managers by no means

stand as mere intermediaries between an overarching diversity strategy and employees, as studies such as those by Ashikali and Groeneveld (2015) imply. Ehrke and Steffens (2015) point out that research on attitudes towards cultural diversity and diversity management needs to move beyond the phase of merely verifying whether an intervention has the desired effect on employees and instead turn to examining the how and why of the desired outcome. In practical terms, the findings of this study indicate that diversity management in STEM is relevant to supporting managers, that managers need to be equipped with the necessary knowledge and understanding to act effectively and appropriately, and to be able to pass this on to their employees. The present results also indicate that agile working does not create diversity awareness. Even university graduates cannot be assumed to have experience in this area. The globalized and digitized world of work makes it essential for diversity management to take these attitudes and influences on managers into account if one wants to understand the how and why of cultural diversity in STEM professions.

### **Abstract**

Advancing globalization processes, including the internationalization of labour markets, supply chains and consumer markets as well as migration movements, lead to a rise in cultural diversity within many societies. As a result, intercultural competence is becoming increasingly relevant. The central interest of this study was to identify facets of intercultural competence and to determine the breadth of situations in which intercultural competence is perceived as necessary. For the analysis on which this paper is based, 61 structured interviews were conducted. Results show that perceived facets of the content of intercultural competence could be categorized into (1.) relational level characteristics such as freedom from prejudice and empathy, (2.) attitudinal stances such as respect and acceptance, and (3.) skills such as flexibility and foreign language proficiency. With regards to specific situations in which intercultural competence is relevant, both stays abroad and everyday situations in one's own society were found, while the focus of participants was on stays abroad. The study provides important heuristic indications for the development of intercultural competence construct and indicates that future research should further explore possibilities for promoting competence in everyday life.

**Paper type** – Academic Research Paper

## **1 Introduction**

As a result of globalization processes, advancing digitization, and related developments, intercultural competence is becoming increasingly important. Global societal and economic challenges include high labour mobility, large-scale refugee movements, intergroup conflicts, and dealing with limited resources or even pandemics such as the Corona pandemic. Intercultural competence often recedes into the background of awareness during such phases. However, only a concerted approach and united endeavours enable to cope with challenges of global degree. This is where intercultural communication and intercultural competence take on crucial roles.

Intercultural competence is seen as a prerequisite for successful intercultural interaction. The modern world is characterised by an increasing amount of intercultural interaction situations. However, what actually makes an individual able to act appropriately and effectively in intercultural situations is still not fully understood in psychological literature (Genkova, 2019). The dynamics of the environment, which is developing during globalization, are also described with the acronym VUCA: volatile (nature and dynamics of change as well as nature and speed of drivers of change), uncertain (lack of predictability), complex (intertwining of issues, no [clear] cause-effect chain), and ambiguous (ambiguity of cause and effect) (Rychen, 2016). Many individuals feel threatened by the challenges that arise in the VUCA world. In phases of perceived threat, such as the Corona pandemic, feelings of relative deprivation and of being disadvantaged arise. Realistic group conflict and social identity thus become more relevant to those affected by threat. These phenomena are reason as well as explanation for the emergence and exacerbation of prejudice and discrimination and thus impede intercultural interaction severely. What constitutes cultural competence in the first place? And how exactly can it be measured and be promoted?

## **2 The concept of intercultural competence and its measurement**

Previous studies describe and discuss the challenges of interactions between members of different cultures (Barmeyer & Franklin, 2016). Culture can be defined as an orientation system shared between the members of a certain group, defining membership, and providing identification and meaning as well as norms for perception, thinking and acting (Thomas, 2007). Every group of individuals tends to develop some kind of psychological structure over time that can be

described as culture (e.g., organizational culture, culture in a certain village, scene culture; Schein, 2010). If individuals from different cultures get into contact with one another, they might feel challenged due to the different norms and standards for communication and acting. Moreover, members of different social groups often have prejudice against each other, which also impedes successful interaction (Barmeyer & Franklin, 2016). Threatening circumstances like the still ongoing globalization, loss of former certainties and the increasing speed of societal changes are linked to an accentuation of intergroup conflicts and threat rather than cooperation and understanding (Genkova & Schreiber, 2020). Especially national cultural differences have been shown to be related to communication issues and hostile intergroup attitudes.

Intercultural interaction thus is complex, often challenging and requires abilities, which are subsumed under the term intercultural competence. Intercultural competence is the ability to communicate with members of foreign cultures without conflict. This requires, among other things, empathy and tolerance of ambiguity (Genkova, 2019). However, the question arises of how to operationalize and measure intercultural competence, since the conceptualization of global challenges is strongly influenced by different norms of thinking and behaviour of different cultures. Different types of measurement methods are discussed and categorized. For example, Deardorff (2011) distinguishes between direct (self-reflection, behavioural observation in intercultural situations) and indirect (surveys or inventories) measurement procedures (Deardorff, 2011).

These measurement approaches can also be found in the discussion of Leung et al. (2014). They distinguish three measurement categories: measurement by self-report; measurement by observer ratings; and performance-based measurement.

The responses collected through self-report primarily allow conclusions to be drawn about the subjective degree of one's own intercultural competence. The main problem for validity in this survey mode is the influence of socially desirable response behaviour (cf. Leung et al. 2014; Lustig & Koester 2012). The assessment by observers can only be reliable and valid if objective assessment standards are defined for concrete intercultural contact situations. These assessment standards must be intersubjectively (i.e., across different observers) directly related to concrete behaviours. However, this narrow specification of concrete situations in which certain behaviours are expected implies that the situations selected in each case can represent only a small segment of reality. Performance-based

measurements, in turn, use standardized test procedures. Since this mode of measurement also can only represent small parts of reality, analogous questions about representativeness and standards of assessment arise as with observation-based procedures. Due to the strengths and weaknesses of the different measurement procedures, it is recommended to choose a multimethod approach, which combines different measurement procedures (see also Deardorff, 2006).

Valid assessment of intercultural competence can thus only be based in a comprehensive operationalisation and an in-depth understanding of the behaviours and situations in which intercultural competence manifests itself. Therefore, developing an operationalization of intercultural competence requires to consider the perspectives and experiences of those who apply intercultural competence in several situations.

### **3 Research question and participants**

The present study investigated two exploratory questions, to create a foundation for future operationalisations of intercultural competence:

1. What do the participants understand by intercultural competence?
2. How relevant is intercultural competence in everyday life and in which situations is it most needed?

In other words, the central questions address the requirements of content validity of the intercultural competence construct, by elucidating experiences with relevant characteristics in various intercultural contact situations. To address these initial questions in depth, a structured qualitative interview guideline with predominantly open response formats was developed. The guideline covered perspectives on what intercultural competence is (e.g., "Which individual skills are necessary in order to have a good intercultural competence?") as well as in which context intercultural competence is needed (e.g., "Have you already experienced a situation in which you wished to have better intercultural competence than you in that instance?").

Forty-one students and 20 working professionals were interviewed. The average age was 30.8 years,  $SD=13.7$ ; 56% of respondents were female, 44% were male, no participants identified as divers. Seventeen of the participants had a migration background, 8 of which were first generation migrants, 9 were second generation migrants. Students and professionals came from different companies and universities from all over Germany. Twenty-eight of the participants without

migration experience stated that they had stayed abroad for at least half a year before. The participants were recruited via the private and occupational networks of the researchers and their assistants. No incentive was offered.

To analyse the interview, quantitative content analysis (according to Mayring, 1996) was used. By forming categories, comparing these categories with each other, and quantifying cases in certain categories, a close coupling between hypothesis generation and interview material was ensured (Bengtson, 2016).

## **4 Results**

### ***4.1 What do participants understand by intercultural competence?***

Participants' experiences with intercultural competence and relevant characteristics with which it is linked were elucidated. The participants addressed a broad spectrum of characteristics related intercultural competence. Very often they mentioned aspects that referred to equal treatment (27 mentions). This category included statements that either directly described aspects of (in)equal treatment or referred to: freedom from prejudice, putting aside prejudice, impartiality.

Also frequently mentioned were facets related to understanding (25 mentions). Two subcategories arose; one category for having an understanding for actions that deviate from the expectations of a given cultural context and another for having an understanding that behaviours deviating from expectations in intercultural contexts can often be attributed to differences between cultures:

*...I think it's important to know in the first place that there can be differences in behaviour that can be attributed to cultural differences and not necessarily just to people's personalities. I think that's an important first step.*

Occasionally, the related construct of listening or hearing someone out was mentioned as important (8 mentions). Listening can support trust building and is in turn a prerequisite for mutual understanding.

However, understanding at the descriptive level alone has been described as not sufficient for successful living together. Many interviewees pointed to the importance of tolerating otherness (23 mentions). Aspects of difference mentioned were primarily actions, approaches, points of view and religions. A concept related to tolerance is that of acceptance. Acceptance was occasionally mentioned (15), especially regarding other customs, traditions, or characters.

Strictly speaking, acceptance goes beyond mere tolerance. While tolerance in the narrow sense means putting up with something despite one's own displeasure, acceptance implies an approving attitude. (It is questionable, however, whether participants were aware of this semantic difference in their descriptions).

Acceptance is facilitated when the thoughts or practices of the other can be comprehended on both a cognitive- and emotional level. Concepts that are directly related to this and which were mentioned frequently are empathy (24 mentions), perspective-taking (13) and sensitivity (8).

Also related to tolerance and acceptance is the concept of respect, which can mean on the one hand an inner attitude of respect, and on the other hand an outer observation of formal conduct towards the other as well as an inclusion of the other. Respect towards people from other cultures as well as respect towards different behaviours was mentioned by a few interviewees (3).

The interviewees also mentioned the process of reflecting on cultures as a characteristic of intercultural competence (20). They related this reflection either to the culture of their own group or to the culture of the foreign group. The content of the reflection can be the comparative strengths and weaknesses of cultures. This can include to consider different perspectives in one's own reflections, and refraining from cultural chauvinism, i.e., not showing arrogance regarding one's own culture (7). Further elements of reflection can be the willingness to change one's own worldview (2), as well as to develop an awareness that different paths can lead to a goal (2).

The respondents' answers further indicated a high level of self-reflection, or an awareness of a development process as a relevant prerequisite for intercultural competence.

*...I would say that you have to have had the experience of throwing your own convictions overboard at times. Because, on the one hand, it is important to question oneself. But if you always come to the conclusion that "Yes, my ways of thinking, all my approaches are correct," then that doesn't really help. And that can't be the case at all. That's why you have to have had the experience of holding a view that you later completely throw overboard.*

The interviewees also named numerous personal characteristics which they considered to be components of intercultural competence. These included adaptability (16), flexibility (7), a willingness to integrate (6), or dealing appropriately with conflict situations (8). Among skills that are culture-specific, foreign language skills played a prominent role (34).

To sum up, the participants seemed to be aware of several challenges in intercultural situations as well as of required skills in order to meet the challenges. Most interviewees were further aware of chances and risks of intercultural interaction (e.g., the chance to broaden one's horizon, and the risk for misunderstanding and conflicts). Participants' perception of intercultural competence could be divided into three categories of aspects, which are presented in Table 1.

Table 1: What do the respondents understand by intercultural competence?

<b>Understanding of intercultural competence</b>	Relational level characteristics, such as being without prejudice, having empathy, sensitivity, & understanding	Attitudinal characteristics, such as acceptance, respect, reflection, & absence of chauvinism	Personal characteristics, such as flexibility, adaptability, or foreign language skills
<b>Number of mentions</b>	97	42	71

#### ***4.2 How relevant is intercultural competence in everyday life and in specific situations?***

The participants were also asked about situations in which they considered intercultural competence to be particularly important. Respondents often perceived intercultural competence as important in situations abroad and while traveling. Frequently mentioned events were: (20) traveling; (10) working abroad (with frequent reference to manners and work ethics); (9) trying to assimilate abroad or trying not to stand out as a foreigner; (8) studying abroad, (2) student exchange year at school.

It was interesting that respondents less frequently mentioned situations in their home country in which they found themselves in a diverse, intercultural environment. Mentioned intercultural interactions in everyday life in the home country were: (18) everyday contacts while shopping, on the street, on the bus, at their hobby, in the neighbourhood, at the doctor's office or at the car repair shop; (5) unspecified contact with people from other cultures at home; (5) concrete situations in which cooperation with people from other cultures was important, and (5) communication with people from other cultures.

The respondents also described concrete situations in which their own intercultural competence was perceived as helpful. One example that is relatively well-known (and stereotypical) in relation to German culture is dealing with punctuality, which was also found among the interviewees (2).

*With my two former roommates who are from Iran, I had arranged once to talk about cleaning the kitchen, and then it was arranged to talk about it at 1:00 p.m. in the kitchen. And at 1:30 p.m. there was no one there, and I didn't get an answer when I asked, and then at 2:00 p.m. we just settled it in the hallway. If I hadn't been aware of the cultural differences in terms of time perception, I would probably have been a bit annoyed...*

The interviewees also described situations in which they, looking back self-critically, reported that more of their own intercultural competence would have been necessary. Examples of this are: dealing with punctuality or understanding time (2), or difficulties in recognizing emotions (2).

*...my semester abroad in Indonesia, well, I think the most difficult or most alienating thing is that people are always super-nice and smiling, but you never really know if that is really their attitude towards you, because a rejection would never be shown so openly, and I have the feeling that such things can be better classified and evaluated with a lot of intercultural competence...*

Another example was a lack of ability to take perspective due to a lack of understanding of collectivist ways of thinking and behaving.

## **5 Discussion**

In summary, intercultural competence and communication are relevant in a wide range of situations, both when traveling and in situations in the home country which are characterized by cultural diversity. Research on intercultural initially had initially a rather niche existence and was, for example, limited to foreign language teaching. More recently, common awareness for the importance of intercultural competence is rising, while intercultural communication is increasingly affecting everyday life of people all over the world, due to modern media, the internationalization of the economy as well as migration movements.

The aim of the present study was to investigate the practical experiences with intercultural competence in intercultural contact situations. This involved identifying perceptions of different facets and dimensions of intercultural

competence. Aspects of intercultural competence found in the interviews can be categorised into relational aspects, attitudes, and personality characteristics.

Specific situations in which intercultural competence is relevant were also identified, thus creating the foundation for the development of a measurement instrument of intercultural competence that covers a range of situations which is required for achieving external validity. It was found that the respondents had very detailed perceptions and experiences concerning facets and dimensions of intercultural competence.

In the specific situations described by the interviewees, cultural sensitivity was reflected to different degrees. Cultural sensitivity was more evident in the descriptions of stays abroad than in the descriptions of dealing with diversity in everyday life at home. Considering the advancing globalization, future research should explore further the possibilities for developing and promoting skills for dealing with diversity in everyday life.

The advantage of the present qualitative study is that it provided an exploratory insight into the perspectives of students and professionals with and without experience abroad on what characterizes an intercultural competent person in various situations. The interview guideline covered a range of topics on intercultural competence and asked about intercultural contact situations in a variety of contexts, such as university education, application processes, the workplace or situations of everyday life.

A potential moderating factor to be considered in future research is the potential influence of company sizes and of different economic sectors. For a more in-depth analysis, several employees and managers should be interviewed, covering various business sectors and company sizes, to systematically compare similarities and differences in corporate cultures and management styles. Moreover, the study design lacks the systematic consideration of different hierarchical levels of companies, such as top- and mid-level managers. A further limitation is constituted by potential social desirability effects or deliberate misrepresentation, even though care was taken in the study to avoid leading questions. Social desirability could lead to a distortion of the results with regard to, for example, personal responsibility or the abilities of the individual, so that the interviewees may have partly provided distorted statements. However, since participation in the interview was voluntary, and since no sanctions or other effects were to be expected from certain statements due to guaranteed anonymity, the extent of such effects might be limited.

Since participants came from a variety of companies and universities, context specificity and generalizability of the results could be further analysed in future studies.

## **6 Conclusion**

As intercultural communication is becoming increasingly relevant and present in the everyday lives of people around the world while the world continues to grow closer together (digitization, globalization, migration movements), the focus of this study was on perceptions of various facets and dimensions of intercultural competence (relational level characteristics such as freedom from prejudice and empathy, attitudinal characteristics such as respect and acceptance, and skills such as flexibility and foreign language proficiency). It was suggested that listening supports mutual understanding and thereupon can lead to acceptance. In addition, specific situations in which intercultural competence is relevant were identified. Particularly high cultural sensitivity was evinced when subjects were themselves foreigners in a country, e.g., during a stay abroad. Dealing with diversity in everyday life at home was less present in the awareness of the participants. In view of the ongoing globalization, it is a task of further research to explore possibilities for the development and promotion of awareness and skills for dealing with diversity in everyday life.

### Abstract

Global dynamics is a pervasive phenomenon, influencing continuously national socio-economic systems and, in emergent cases, affecting directly even individuals. There are numerous scientific theories and frameworks, mostly identifying the unequal distribution and limited renewability of resources as the primary drivers of global dynamics. To minimize their undesirable consequences, considerable effort is spent on joint harmonization of international strategic and policies of single countries. This can hardly happen without innovative decision-support tools, breaking the originally intractable complexity into a set of well-structured, explainable, and straightforwardly applicable subproblems.

The main goal of this research was to simplify, systemize and structure the influences of global dynamics on single countries and help them to formulate viable strategies with respect to global changes. Rather than a detailed methodology, this paper proposes and with real-world examples justifies a reusable conceptual framework, based on qualitatively represented expert knowledge, specified with quantitative outputs from data mining, applied on selected national indexes.

In the design phase, a two-stage qualitative model of global dynamics was developed, validated, and functionally demonstrated. It merges traditional knowledge-based modelling of sustainable world with data-driven identification of the national-specific development drivers, complemented with global indicators, concerning the planet and humanity. The data-related level is built from the coherently selected global indexes, processed with different machine-learning tasks. Subsequent high-level qualitative model is expressed in the form of Causal loop diagram, extending the expert and domain knowledge with significant national-specific variables and relations, found in data.

The proposed way of individualized modelling of national strategies with respect to evolving global dynamics can facilitate policy-making processes on the governmental level. Its flexible and multilevel structure allows identification of a minimal set of key parameters, guaranteeing efficient and robust planning of country future. Application possibilities of such layered framework are presented for case of Germany.

## 1 Introduction

The world economy is currently undergoing significant changes. It is influenced by new phenomena that complement and condition each other, but also have contradictory manifestations. Globalization is one of the most debated terms of today. The term is very contradictory and there is no consensus among economists about its meaning - opinions differ fundamentally (Kivilcim, 2008). Globalization is perceived as a long-term process by the authors of the International Encyclopaedia of Business and Management (Warner and Kotter, 2002). The authors directly state that globalization is a process of growing integration of world civilization. This process is understood to be long-lasting and lasting practically since prehistoric times. For example, the authors state that the expansion of the first people into new territories through massive migration is a symbolic example of globalization. Siebert (2000) states that globalization means reducing market segmentation and increasing the interdependence of national markets.

According to Hamilton and Webster (2009) globalization refers to the social, economic, political, and technological links in different countries. Globalization is a contested concept that refers to shrinkage of time and space (Steger, 2009). According to another definition globalization is the elimination or diminution of state-enforced restrictions on exchanges across borders and the increasingly integrated and complex global system of production and exchange that has emerged as a result (Palmer, 2002).

By globalization in current economic and other theories we mean a complex transformation of market relations (but also other social ones events) on a global scale, which materializes in a number of changes in the economic and non-economic spheres (Duarte et al., 2021; .Manoharan, 2021) This transformation, for many reasons, is changing the world economy and the social establishment of the world towards greater coherence and dependence of individual economic subjects, not only adds links between individual elements, but also quality changes completely and completely structurally, or creates completely new typologically (Wu and Lee, 2021).

According to World Trade Organization (Azwar and Leviza, 2020) globalization is the substantive process of economic and technological expansion looking towards the opening-up and integration of the entire world into and under one economic system. At the OECD (Padhan et al., 2020) interpret globalisation as a process of closer economic integration of global markets: financial, product and labour. Globalization, by the UNO, is defined as the global integration of economies and societies. Globalization, the process through which an increasingly free flow of ideas, people, goods, services, and capital leads to the integration of economies and societies, is often viewed as an irreversible force, which is being imposed upon the world by some countries and institutions such as the IMF and the World Bank (Tate, 2020). According to World Health Organization (2021), globalization can be defined as the increased interconnectedness and interdependence of peoples and countries. It is generally understood to include two inter-related elements: the opening of international borders to increasingly fast flows of goods, services, finance, people, and ideas; and the changes in institutions and policies at national and international levels that facilitate or promote such flows.

Globalization has number of aspects that have a selective effect on individual states in both positive and negative ways. The International Monetary Fund (IMF, 2021) lists four main aspects of globalization: international trade, movement of

investments and capital, migration of persons and dissemination of knowledge. Many authors deal with these aspects and associated areas in their studies, e. g. studies about fair trade (Zhu et al., 2021), foreign trade (Hu et al., 2021), sense of migration (Bascuñan-Wiley, 2021), dissemination of CSR practices between international corporations and local companies (Kowalska, 2018; Tetreanova and Patak, 2019).

Today, we face many problems that are intricately interconnected and cannot simply be included in any traditional scientific discipline. Modelling of global dynamics is a very useful tool that can help. With models, we can make predictions (Hartzell et al., 2021), estimate the impact of various interventions in systems (Yun et al., 2020), and better plan various actions in addition to these concrete results, however, models are also very important on a mental level - just working with models significantly affects our way of thinking and looking at the world. Models force one to articulate our vague ideas clearly. They also make it possible to share ideas and pass on much-needed information between experts in different fields. Modelling of global dynamics is used by many authors in different areas, e. g. in healthcare (Zhang et al., 2020; Li and Zhao, 2021; Ma et al., 2021), in transport (Yoon, 2021; Danylkiv et al., 2020), in environment (Hartzell, 2021; Sverdrup et al., 2020) or in demography (Li and Xu, 2020).

GDP and the indicators that affect it can be considered as sources of global dynamics. The determinants of economic growth are made up of factors that are interrelated and together affect the rate of growth or decline of the economy. The Nature Conservancy (2021) deals with a group of factors affecting GDP. According to them, everything is connected to everything and the whole system of GDP creation is interconnected. The main factors mentioned include global employment and poverty, air quality and climate, the terrestrial, freshwater and maritime systems, energy resources, sanitation, human health, and the economic impact of disasters. It is therefore not only economic indicators that have the main influence on GDP generation, but also technological, social and environmental indicators. It points out, above all, the suitability of looking at systems from a holistic point of view and not focusing separately on each of the factors separately. On the contrary, Capra (2016) does not focus directly on the state and development of GDP, but on global problems that countries must face and be able to deal with as best as possible. It divides this issue into two main sections, namely population difficulties and environmental issues. Population problems include poverty, population growth, the pressure of demographic

change and social inequality. Environmental topics include climate change, "climate" refugees, fossil fuel consumption and food security threats.

The main factors influencing GDP growth include the following indicators (Agarwal, 2020; Saini, 2021):

- Natural resources - e.g., oil, mineral deposits, but also native land and water availability,
- Physical capital and infrastructure (resp. equipment) - increase in investments in physical capital, e.g., roads, machinery, and factories, thanks to investments in physical capital there is an increase in productivity and performance,
- Population and labor force (resp. employment) - a growing population can result in higher availability of labor, but can also lead to high unemployment,
- Human capital - increasing investment in human capital in order to improve the skills of the workforce and consequently increase productivity,
- Technology - increasing investment in technology in order to increase productivity while reducing costs and increasing competitiveness,
- Laws, resp. rules and regulations - regulation of economic activity by the state or other institutions.

There are also holistic theories and frameworks, explaining the internal mechanisms of global dynamics from different viewpoints (Donges et al., 2020; Liu et al., 2007; Smil, 2021; Thurner et al., 2018). These multidimensional approaches arise from a complex internal network of feedback loops, interactions of which are affected with a wide range of time constants, varying from weeks to millennia. Such extensive dynamic structure naturally possesses an oscillatory and conditionally unstable behaviour, when in critically exhausted sectors even neglecting parametric changes can result in catastrophic reactions, like the widely cited Butterfly effect (Lorenz, 1963). Based on these theoretical foundations, quantitative models of sustainable world, created in accordance with the system dynamic framework, introduced in (Forrester, 1961) were designed and successfully applied (Capra, 2004; Forrester, 1971; Meadows, 1974; Turner, 2008). They typically combine the dynamics of food, industry, population, environment, and non-renewable resources sectors.

Considerable official effort is spent on harmonization of global dynamics effects with joint strategic development goals of single countries (EUR-Lex, 2016;

UN, 2020). These interventions strive to control namely the publicly visible global impacts, including climate changes, lack of natural resources or economic, humanitarian, or migration crises. However, because of inherent spatio-temporal complexity and socio-economic character of global dynamics, it is hardly possible to design the realistic scenarios of its future evolvement or even to solve them and thus explicitly mitigate related risks (WEF, 2021). Despite the enormous effort and investments, it is evident that the worldwide distributed complex structural aspects and behavioural patterns of global dynamics, instantiated through nationally differentiated conditions, form the burning problem of the contemporary world.

## **2 Methods**

This research followed the traditional iterative methodology proposed, e.g., in (Mitroff, 1978) and enhanced it for the dynamic problems (Meadows and Wright, 2015) as follows:

- a) Problem definition, structuring, identification of key variables and formulation of dynamic hypotheses,
- b) Knowledge elicitation (review of resources, capturing of knowledge) and specification (formalization of problem-describing structure and behavior),
- c) Design of related model and its verification,
- d) Qualitative, quantitative, or combined experiments, concerning mostly practical impacts of sensitivity and scenario analyses. Existence of quantitative models allows also parametric optimization of original problem.

Methodological specificity of presented platform insists in the combination of low-level quantitative and high-level qualitative analyses, as it is shown in Figure 1. In the design phase, a two-stage qualitative model of global dynamics was developed, validated, and functionally demonstrated. This model merged the traditional system dynamics knowledge-based modelling with data-driven identification of national-specific GDP drivers, complemented with determining global environmental and social indicators.

*Figure 1: Applied two-stage methodology of national performance modelling*

Assumed temporal behaviour of selected variables results from their nontrivial synthesis within a complex systemic model, constructed from the collected data and knowledge artefacts. This model was represented with a set of simultaneously valid diagrams, gradually simplifying and specifying the real-world problem. Its highest level was represented with a mind map and further concertized in a form of system diagram. Related behavioural features were synthesized from joint contributions of mutually interconnected loops of related Causal loop diagram (CLD). Initial dynamic hypotheses were discussed with respect to the feasible execution of inner loops, exposed to typical configurations of external events. All these formalization techniques are tools thoroughly characterized in (Morecroft, 2015; Sterman, 2014).

The data-driven model processed national indexes concerning economy, population, and environment of the first 20 OECD countries during the period 2014-2019, ordered according to their GDP in the last year of analysed period (OECD, 2021): Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Iceland, Ireland, Italy, Luxembourg, Netherlands, New Zealand, Norway, Sweden, Switzerland, United Kingdom and United States. The reason for somewhat obsolete selection was that although it includes the impacts of relatively persistent global changes like terrorism, migration or environmental hazards, it was not yet affected with the current pandemics. Raw source data were cleaned, normalized and transformed into two specific sets, convenient for further

processing by different algorithms of supervised and unsupervised machine learning. Supervised tasks considered equally discretized values of GDP per capita (GDP) as the target variable and single records were processed anonymously, i.e., without relation to the country. Instead of more typical classification or regression, the main goal of supervised analyses was dimensionality reduction, searching for a relevant subset of the most powerful GDO predictors. National-specific features were searched personally in outputs of different types of unsupervised learning procedures.

Two types of data sets for generally oriented static and nationally oriented dynamic analyses were prepared. While static data contained values of regular variables of complete indexes, dynamic, country-specific data consisted of total differences and slopes of linear approximations of every variable for the whole investigated period.

Different modules of the SAS Enterprise miner were used for machine learning tasks. StatExplore with Gini tree-based selection criterion implemented the dimensionality reduction procedures and Variable Clustering node with default parameters performed the unsupervised clustering procedures. Detailed information regarding particular machine learning and pattern recognition methods can be found in (Bishop, 2007; Witten *et al.*, 2016).

### **3 Results and discussion**

#### **3.1 Data-driven model**

Source data, containing the desired knowledge artefacts characterizing global and national drivers of GDP, were derived from a broader set of recognized yearly published international indexes, recommended by domain experts. During the selection stage, candidates were evaluated with respect to their diversity (D), independence (I), transparency (T), internal structure (S), availability of methodology (M), trustworthiness of resource (R), and range of local coverage (C). These features were quantified in scale from 1 to 5 and indexes with the highest total scores were adopted. Besides the score, the final set also had to address all basic dimensions of internal sustainable development, including population, industry, and environment, as well as the primary resources of global dynamics. Results of this evaluation are summarized in Table 1, from where the first five candidates were chosen and extended with the yearly national levels of

Unemployment rate (UNR) and GDP. From the system point of view, indexes of Competitiveness, Democracy, GDP, Human Development and Unemployment were considered as internal or national-level descriptors and represented the fundamental structural elements of subsequent CLD. Environmental performance index and Multidimensional poverty index, limited on developing countries, served as exogenous inputs of global dynamics and their role insisted especially in design of appropriate scenarios.

Table 1: Evaluated and selected global indexes, jointly constituting national GDP

<b>Global index/Feature</b>	<b>D</b>	<b>I</b>	<b>T</b>	<b>S</b>	<b>M</b>	<b>R</b>	<b>S</b>	<b>Total</b>
Democracy [DEM] (The Economist Intelligence Unit, 2020).	5	5	5	5	5	4	5	34
Competitiveness [CMP] (Schwab, 2019)	5	4	5	5	5	4	5	33
Environmental Performance [EPE] (Wendling et al., 2020a)	5	4	5	5	5	4	5	33
Human Development [HDE] (UNDP, 2020)	5	4	5	5	5	4	5	33
Multidimensional Poverty [MPO] (Conceição et al., 2020a)	4	4	5	5	5	4	4	31
Gender Gap (Schwab et al, 2020).	2	5	5	5	5	4	3	29
Knowledge (Ghriss et al., 2020).	4	3	5	4	4	4	5	29
Peace (IEP, 2019)	2	3	5	5	5	4	3	27
Terrorism (IEP, 2019a).	2	3	5	5	5	4	3	27
Climate Risk (Eckstein et al., 2020)	2	3	4	4	5	2	3	23
Migration (UNHCR, 2020a)	2	4	3	3	3	3	2	20
Crime and Safety (Numbeo, 2021a, Numbeo, 2021b)	2	3	2	1	2	4	2	16

Detailed structure of selected indexes is shown in Figure 2 with internal components marked as follows: solid lines: MPO Health (MPO\_HEA), EPE Environmental health (EPE\_HEA), dashed lines: MPO Education (MPO\_EDU), EPE Ecosystem vitality (EPE\_VIT), bold lines: MPO Living standards (MPO\_LIV).

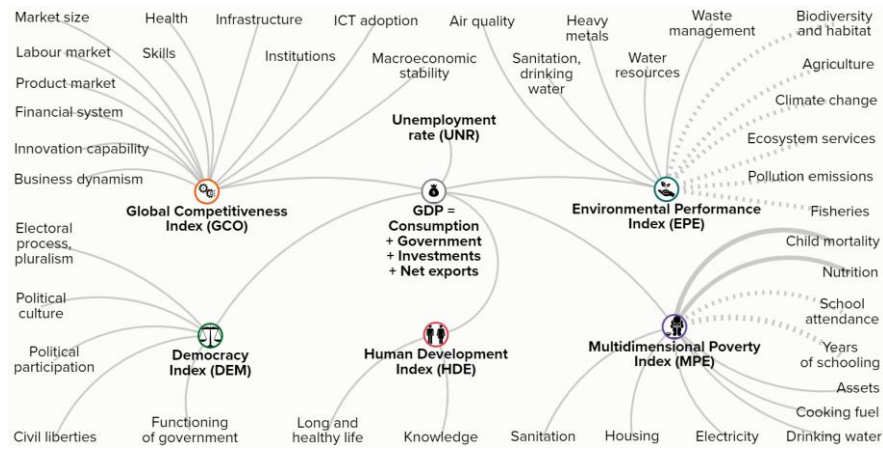

Figure 2: Internal structure of selected indexes

After this specification, complete and unreduced static set contained 120 21-dimensional records and the dynamic set had 20 28-dimensional records. Both sets were processed as follows:

- Task 1: static data processed with supervised learning, resulting to the set of general steady GDP predictors valid equally for all processed countries,
- Task 2: static data processed with unsupervised learning, resulting to the set of country-specific steady GDP predictors,
- Task 3: dynamic data processed with supervised learning, resulting to the set of general dynamic GDP predictors (data slopes) valid equally for all processed countries,
- Task 4: dynamic data processed with unsupervised learning, resulting to the set of country-specific dynamic GDP predictors (data slopes).

For better clarity, all presented graphs are relative. In absolute numbers, outputs of unsupervised tasks explain almost full variance of original data, while supervised algorithms covers only around 65% of the total variance. Moreover, the accuracy of dynamic predictions is lower because of small size of this dataset. Global indexes are not available in dynamic analyses, because their values are similar for all countries. This methodological limitation is acceptable, as in specific cases countries could promptly react on internal changes, but usually cannot simultaneously handle also considerable effects of global dynamic. Moreover, origins of these slow changes lie in the past, so the steady information could be satisfactory.

Figure 3: Comparison of regular values of the best steady GDP predictors for all analysed countries (results of Task 1) with specific findings for Germany (Task 3)

The ordered significance of general steady predictors (Task 1) in Figure 3 shows the key role of the human-related internal drivers HDE and DEM, followed by the more industrial ones, CMP and UNR. Influence of global predictors is lower and approximately equal. Situation in Germany, derived from the coordinates of the corresponding data cluster (Task 3) is slightly different (note: predictors Education and Living Standards are 0 for Germany). Although the paired dominance of HDE and DEM remained, there is a considerable mutual difference. Also, the roles of UNR and CMP increased and remarkable is also the national meaning of EPE\_HEA.

These finding suggests the most powerful causal relations with respect to GDP. Because of the later applied dynamic analysis, there is no need to distinguish between the cause and effect and the only limiting factors are the durations of incorporated loops. All discovered knowledge artefacts can decrease the overall complexity of originally posted problem, contribute to specification of final qualitative model and simplify the validation of dynamic hypotheses.

Figure 4: Comparison of slopes of the best dynamic GDP predictors for all analysed countries (Task 2) with specific findings for Germany (Task 4)

Although the dynamic analyses have rather supplementary character, in the presented case they showed the difference between the general and specific indicators. Results in Figure 4. show that in the general case UNR slope (negatively) corresponds with GDP slope, in case of Germany the significance of this indicator is minimal, and the strong role plays variable CMP. Also, the meaning of commonly influential human-related indicators HDE and DEM is suppressed in Germany.

### 3.2 Formulation of dynamics hypotheses

Dynamic hypotheses H1 – H5 were formulated to illustrate sample interventions between global scenarios and GDP related national-level decisions in Germany during the analysed period 2014–2019. Their starting point is represented with the annual GDP growth 3,7% in 2014. All hypotheses are indicatively quantified in Figure 5.

Figure 5: Dynamic hypotheses for sample scenarios

- H1, pessimistic: As a result of global changes, there is an increase in unemployment and poor availability of skilled labor. This has a negative effect on GDP growth. There are frequent gaps in the labor market, limiting the productivity of the public and private sector and reducing their competitiveness.
- H2, realistic: Global and national environmental impacts accelerate with increasing competitiveness and higher consumption. Efforts to address this situation through appropriate restrictions have a negative effect on GDP. Conversely, investment in innovation can slow down environmental change. This also has a positive effect on GDP growth.
- H3, optimistic: Life expectancy is increasing slightly, people are satisfied, and a large part of the population has an advanced level of education. The education system utilizes modern methods and technologies, the average state expenditure on education is at a higher level than the average of OECD countries. This has a positive effect on GDP growth and provides more financial opportunities to respond to negative global pressures.
- H4, conservative: Both major global factors – environmental change and global poverty – may result in population migration. At least for the time being, it has a rather negative effect on GDP growth. Efforts to directly combat these influences occur mainly through humanitarian aid and regulations.

- H5, progressive: External influences negatively affecting GDP can be indirectly compensated, for example, by higher investment in education. These have positive effect on the level of education and knowledge of the population. Better education helps to increase human capital and the growth of a skilled workforce. As a result, unemployment falls, which will have a positive effect on GDP growth.

### ***3.3 Knowledge-based model***

The set of key variables, discovered in the data-driven stage, was used for formulation of dynamic hypotheses and their validation through the corresponding predictive qualitative model. Such model is composed from patterns of the most relevant activities and can project their joint consequences into a realistic time horizon. Established predictive support helps managers to anticipate future performance with respect to determining external scenarios and efficiently reflect their impacts. Resultant improved resilience maximizes possible benefits, minimizes losses, orchestrates internal environment and harmonizes external relations.

To obtain the desired Causal loop diagram for Germany, linear structure of mind map from Figure 2 was specified using the index-based knowledge and transformed to a cyclic, behaviour generating structure, simplified version of which is in Figure 6. Even in this reduced form for publication it contains 61 loops with length from 3 to 11 edges. Knowledge fragments discovered from indexes were utilized for modification of general high-level causal loop diagram, in which the less sensitive segments were suppressed, and the more powerful parts were analysed to introduce and justify desirable policies or strategies. These arrangements should maximize the selected target variables with the most efficient internal levers and simultaneously minimize the influence of global perturbances. Inclusion of so far unaddressed pandemic just illustrates the straightforward scalability of presented approach.

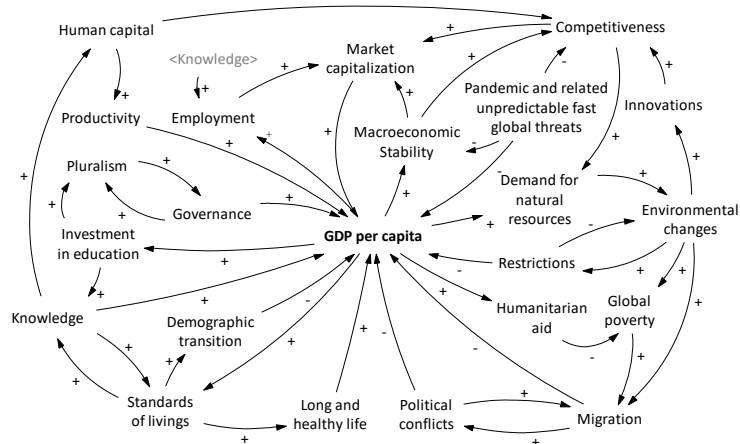

Figure 6: Causal loop diagram of presented problem, modified for German GDP

### 3.4 Discussion of dynamics hypotheses

- H1: There are several ways in which global factors can affect unemployment. Mostly they are linked through GDP and knowledge variables. CLD also shows the link between productivity, employment, and human capital. The raise of unemployment due to global influences has negative impact on human capital and its quality. This results in a reduction of productivity, GDP and employment. In addition, the CLD shows that employment has a direct impact on market developments, which also affect GDP.
- H2: CLD shows a link between competitiveness, natural resource consumption, environmental change, regulations, innovation, and GDP. It is also evident that higher competitiveness leads to higher consumption of natural resources, which negatively impacts the effect of environmental change. The relationship between these changes and regulations that have a negative effect on GDP is also present. Innovations arising from the need to act against environmental change lead to better competitiveness, which has a positive effect on GDP and thus offers more opportunities to combat environmental change. Although innovations resulting from environmental change do not directly lead to suppression of environmental effects, they contribute to higher GDP through the variable *Markets* and thus provide more

funding thanks to increasing competitiveness. This dynamics can also be used to combat environmental change.

- H3: In CLD, there is a leading loop connecting living standards, long and healthy life, knowledge, and investment in education. Thus, growing GDP stimulates increase of living standards, which will have a positive effect on a long and healthy life. This raises population satisfaction and, in turns, GDP. Higher GDP enables the expansion of investment in education, which will ideally be reflected in the more widespread use of information and communication technologies in education. The growth of investment in education accompanied by higher living standards has a positive effect on the level of knowledge. It has a positive effect on employment and human capital. This together leads to higher competitiveness and, through the variable *Markets*, to higher GDP. Human capital also has a positive effect on productivity, which again has a positive effect on GDP.
- H4: CLD in Figure 6 shows the interconnection of the parameters of environmental change, global poverty, and migration. Environmental change can lead directly to migration, for example due to acute threats and natural disasters, or indirectly because of poverty, caused, e.g., by drought or lack of food. Migration currently has a rather negative effect on GDP. Its potential is not being used and migrants are not fully integrated into everyday life. This, for example, hampers the effect of possible positive demographic changes. In addition, the growth of migration can lead to the intensification of political conflicts. These have a negative impact on GDP growth. Such effects can be compensated with regulations that have a negative impact on GDP and are intended to prevent further deterioration of the environment. In addition, it is possible to use humanitarian aid, which is primarily intended to prevent local unrest and improve the living situation of the local population. The more financial resources the country has, the more support can be dedicated to humanitarian aid programs.
- H5: There are many ways to respond to external influences. According to CLD diagram, a positive effect can be observed as a result of higher investment in education. This affects not only the level of educational attainment, the knowledge of the population, human capital, and

unemployment, but also addresses competitiveness and markets, which have a positive effect on GDP growth.

Previous discussions confirmed that all originally posted dynamic hypotheses are explainable through the presented qualitative model. It is also capable to demonstrate interactions between the German-specific and global GDP-related factors. We found that regulations, humanitarian aid or innovation serve as direct assistance in combating global negative effects and, in certain circumstances, can exacerbate environmental changes. Given the results of data mining, which showed only a minor influence of global factors on GDP growth, the positive effect of higher education or competitiveness will certainly prevail.

In the case of Germany, it is recommended to invest in education and satisfaction of the population. Investment should ideally be higher than the OECD average. The education of the population is a key indicator for the good functioning of the state and its prosperity. The quality of human capital and the level of unemployment are automatically linked to this matter. When such parameters are set correctly, competitiveness increases. The overall competitiveness of Germany can be also improved with systematic support of ICT and digital technologies, resulting into a higher productivity.

#### **4 Conclusions**

This paper analysed influence of global dynamics factors on national performance expressed in terms of GDP. To fulfil this goal, a two-stage model, combining related quantitative and qualitative aspects was proposed and discussed. The most significant decisive factors of GDP generation, composed of national and global drivers, were identified from results of different machine learning techniques, applied on selected global indexes. Based on these findings, the problem characterizing dynamic hypotheses were formulated and subsequently analysed through an accordingly designed Causal loop diagram. Applicability of resultant predictive behavioural patterns were demonstrated for case of Germany.

The authors believe that innovativeness of the suggested way of incorporation of global dynamic aspects into the national strategic decision-making processes insists in the following contributions:

- Straightforward and efficient simplification of the naturally complex problem,

- Standardized, widely applicable and easily replicable architecture of proposed solution,
- Layered structure, composed both from the top and bottom-level knowledge artefacts,
- Understandable internal representation, supporting group decision making,
- Partial validation of model during the data processing stage,
- Straightforward computational implementation within a system dynamics framework.

Such outcomes also synthesize an applicable solution for the originally posted research problem. The proposed way of individualized modelling of strategic development with respect to typically evolving global dynamics can facilitate policy-making processes on the governmental level. Its flexible and multilevel structure allows identification of a minimal set of key parameters, guaranteeing efficient and robust planning of country future by means of well-informed, creative dialogues of involved stakeholders. On the other hand, for the national governments with yearly planning cycles, it is practically impossible to appropriately respond to the fast and rare global events, such as the COVID-19 pandemics. These out-of-system events are considered as disturbances, and their elimination depends entirely on the momentary capabilities and resources of the national planning and control system.

### Abstract

Despite the growing interest in the field of IC, there is still a lack of evidence and literature on the importance of IC in companies' turnarounds, an issue that is even more pressing due to Covid-19.

The pandemic is impacting corporates' performances all over the world and most of them will face turnaround processes after the end of the emergency. In this scenario, our paper aims to study the positive role of intellectual capital on overcoming economic-financial distress.

More particularly, assuming that IC - represented by corporate governance' professional background, skills, knowledge, internal and external relationships - is one of the firm's key factor and that, through the turnover of corporate governance, new knowledge and organizational capital is introduced, we presume that IC helps the competitiveness and thus the positive conclusion of the recovery plan.

In order to demonstrate that some changes in the corporate governance could reconfigure the IC, increasing the chances to carry out a successful turnaround, we considered four case studies of Italian companies that have positively overcome a crisis.

The analysis showed that the intellectual capital of corporate governance influences the success of the turnaround processes. Even though further investigations are essential to fully understand the role of IC in the treatment of a crisis, our results suggest that it is

possible to view IC as a lever for overcoming economic-financial distress and, particularly, that the renewal of corporate governance positively influences the turnaround outcome.

**Keywords** – corporate governance, intellectual capital, turnaround, value creation

**Paper type** – Academic Research Paper

## 1 Introduction

In the XXI century, the knowledge-intensive economy fostered the study of intellectual capital (IC). Indeed, in the last decades, scholars and practitioners are focusing on IC, which is considered both a factor for the success of national economies and a company's strategic driver (Asiaei and Jusoh, 2015; Clarke et al., 2011; Iazzolino and Laise, 2016; Lerro et al., 2014; Martín-de Castro et al., 2019), developing different strands of research.

Despite the increasing interest in this field of research, the literature is still missing significant contributions concerning the role played by IC in corporate turnarounds. To the best of our knowledge, one of the few papers is that one of Schiuma et al. (2008).

In this paper, we assume that IC is a corporate key factor represented by professional background, skills, knowledge, organizational structure, and internal and external relationships (Mazzotta, 2018; Paoloni et al., 2020) and that to introduce new knowledge and organizational capital (Chen et al., 2014; Berezinets et al., 2016; Agostini and Nosella, 2017) helps the competitiveness. Therefore, we presume that changes in management could reconfigure IC (Keenan and Aggestam, 2001) in a way that might impact the turnaround outcome. In other words, our research question is "does the renewal of IC brought by new corporate governance members affect the turnaround outcome?" To answer this question, we qualitatively investigate four successful case studies in which authors have been involved as advisors, highlighting the relevance of the new directors and shareholders on the IC that positively impacts the recovery.

The paper is structured as follows. Section 2 reports a review of the literature, with regard to intellectual capital and corporate turnaround. Section 3 provides for the description of four business cases that point out the relevance of the change in terms of IC and its importance to solve the crisis. Section 4 illustrates the discussion of the results and our main conclusions.

## 2 Theoretical Background

Due to the relevant role played by IC, most authors consider – among others – its potential in terms of value creation, competitive advantage, and success (Agostini et al., 2017; Demartini and Beretta, 2020; Kato et al., 2015; Razafindrambinina and Anggreni, 2017; Wang and Zatzick, 2018; Guthrie et al., 2006; de Pablos and Edvinsson, 2014).

Although literature provides various descriptions of IC, most of the research agrees on defining it as the integration of human capital, structural capital, and relational capital (Bontis, 1998; European Commission, 2002; Tayles et al., 2007; Kamaluddin and Rahman, 2009; Kianto et al., 2014; Appuhami and Bhuyan, 2015). Following we provide a short description of each component:

- Human capital (HC) refers to explicit and tacit knowledge, expertise, aptitude, education background, competencies, and characteristics of human resources (Bontis, 1998; Dzinkowski, 2000; Edvinsson and Malone, 1997; Lönnqvist and Mettänen, 2002; Roos and Roos, 1997; Stewart, 1997; Subramaniam and Youndt, 2005; Schiemann and Guenther, 2013; Berezinets et al., 2016), including both top executives and employees. Indeed, Berezinets et al. (2016) focus on IC creation, underlining it is generated not only by employees, as traditionally assumed, but also by advisory councils, suppliers, volunteers, strategic allies, partners, and members of board of directors (BoD). BoD, thanks to their skills, experience, and networking connections, can properly define the firm's strategy, identify the vision and the mission, and give the guidelines to top management and all company's staff, in order to maximize performances. Having said that, the BoD's tasks and responsibilities "can be considered as the driver of IC generation that leads to a more effective work environment and the employment of other elements of IC in a company. [...] the BoDs is also the driver that makes other elements of IC work more effectively" (Berezinets et al., 2016).
- HC is one of the main sources of other intellectual assets within a firm (Abdulaali, 2018).
- Structural Capital (SC) includes organizational and technological capital (Martín-de Castro et al., 2019) and refers to the combination of knowledge, that is useful for building a proper, efficient, and effective

organizational structure, and the things like proprietary software systems and distribution networks, that are more strictly linked to companies' technical systems (Bontis, 1998; Edvinsson and Malone, 1997; Stewart, 1997; Petty and Guthrie, 2000).

- Relational Capital (RC) pertains to intrinsic value and knowledge embedded in corporate relationships with stakeholders, such as customers, suppliers, distributors, partners, and investors (Dzinkowski, 2000; Edvinsson and Malone, 1997; Roos and Roos, 1997; Pike et al., 2005).

With specific reference to the IC of the BoD, Nicholson and Kiel (2004) define it as "the intellectual resources such as knowledge, information, experience, relationships, routines, and procedures that a board can employ to create value". IC exists in every firm, regardless of corporate governance system (Keenan and Aggestam, 2001; Nicholson and Kiel 2004; Berezinets et al. 2016). However, much of a company's ability to create and leverage IC rests with its BoD members and shareholders.

Therefore, it is clear the role played by BoD, as well as by top management and shareholders, in the IC creation, is helpful to overcome financial distress. Indeed, corporate crisis is not irreversible (Guatri, 1986; Scherrer, 2003; Trahms et al., 2013) and, especially if promptly identified (Santana et al., 2017; Brodi, 2018), it can be solved by implementing significant strategic changes (Garzella, 2005). Literature provides contributions regarding the impact of corporate governance on the turnaround outcome (Mariani and Panaro, 2012; Miglani, 2014; Abebe and Tangpong, 2018; Miglani et al., 2020), but few references to the broader topic of intellectual capital exists. As posited by Schiuma et al. (2008), if people possess high levels of knowledge and skills, they can trigger a virtuous circle generating new ideas and techniques able to both launch changes in production and service delivery methods and increase relational capital and then improve performances. Indeed, also Santana et al. (2017) suggest that human resources in declining firms can replace the usual downsizing responses, highlighting its potential relevance.

Several studies show how top executives are essential figures to promote a new organizational structure, underlining their role for the strategic change which is necessary for a successful corporate turnaround (Lenz and Lyles, 1986; Barker and Patterson, 1996; Lohrke et al., 2004).

### 3 Materials and methods

#### 3.1 Research context

A distressed company can adopt multiple choices to survive at a crisis and avoid the failure by adopting several “procedures” (Ferri et al., 2020). In Italy, some of these procedures are formal and provided by the law<sup>1</sup> while others are informal, and their use must not be compliant with any rules<sup>2</sup> (Caputo and Tron, 2016; Tron et al., 2018; Tron, 2021). In any case, the turnaround should encourage virtuous behaviours, and if the crisis is irreversible, it should guarantee the liquidation of companies (Ambrosini and Tron, 2016).

#### 3.2 Methodological approach

The ability to identify the signals of corporate crisis plays a continuing and ever more important role in modern managerial finance. Recently, the specification of a firm’s debts becoming “unlikely to pay” (UTP) has taken on increased importance in Europe, and especially in Italy. The existing literature on distress prediction mostly considers the filing of bankruptcy procedures as a criterion for distress, which represents the final phase of a crisis. By adopting an earlier condition of financial distress, we have managed to consider the relevant inclusion of corporate governance and controlled variables. Most past research includes only economic and financial variables (Dallocchio et al., 2020).

In this article, we want to qualitatively study the usefulness of intellectual capital in successfully restructured companies. This kind of analysis allows us to acquire some information concerning the IC in the turnaround process. Moreover, some authors have been directly involved in the restructuring process and this gives the opportunity, on one side, to observe the recovery management and, on the other side, to obtain several and peculiar information able to better investigate the role of IC in the turnarounds. More particularly, we analysed four success stories to highlight the positive impact of governance changes on the turnaround process and, particularly, the significant effects that the introduction

---

<sup>1</sup> As an instance, the crisis management must ensure at least rights of creditors, interests of stakeholders (e.g., employees), and the affordability of crisis management as provided by the specific laws, defined generally in this paper “insolvency code”.

<sup>2</sup> For example, the Preventive Arrangement with Creditors (“Concordato Preventivo” pursuant art. 161 R.D. n. 267 dated 16 March 1942), that is like US’s Chapter 11, is frequently adopted by small- and medium-sized companies to manage insolvency (Danovi et al., 2016).

of new IC has on crisis resolution. The case studies allowed us to acquire the knowledge of the IC brought by the new personality (like the directors and shareholders) involved in the turnaround.

### *3.2.1 Case studies analysis*

Due to confidentiality reasons, the real names of the companies are omitted.

#### **Case Study 1**

Alpha S.p.A. is an Italian public limited company operating since 1982 in the production and marketing of accessories and paper products for schools and leisure time. Its original success was due firstly to the entrepreneurial intuition to launch a new profitable market and then to the ability to innovate to the high quality its products, and to the wide and transversal offer proposed.

After years of significant growth, from 2008/09 the sales volumes have been declining and the Company began recording negative performances and financial tension, mainly because of the consumption decrease due to the global economic crisis, the inefficient organization, the bad changes in the business model, and some wrong strategic investments; hence, in 2013, Alpha presented a recovery plan, drawn up pursuant to the "insolvency code." The management, with the help of specialized advisors, outlined a turnaround strategy, for the period 2013–2015, primarily based on competitive repositioning, organizational restructuring, and financial structure's redefinition.

To successfully work on these three main guidelines, Alpha appointed a director with specific powers. Indeed, the pool of professionals involved in this recovery plan suggested inserting a new person able to, on one side, bring new ideas, new knowledge, and new relationships and, on the other side, oversee the turnaround process to guarantee all stakeholders. As a matter of fact, this insertion brought substantial value, allowing Alpha to overcome the crisis through the involvement and the renewal of human, structural, and relational capital. The success of the turnaround can be attributed to structural and specific actions that engaged managers, employees, business processes, and stakeholders (e.g., banks and suppliers). For example, the new BoD promoted the optimization of the organizational structure and the revision of ICT systems, the cost rationalization, and the development of proper commercial strategies. This mix of ventures allowed restoring the value creation and the competitive advantage to the point that, in 2018, more than 50% of Company's shares have been acquired by a

private equity fund with the scope to expand American and Asian markets, fostering the international growth.

The success of the turnaround can be seen in Table I that shows Alpha's positive evolution for the period 2012–2018.

Table I. Turnover, EBIT, net results and no. of employees of Alpha S.p.A. (2012–2018)

	2012	2013	2014	2015	2016	2017	2018
Turnover	41.023.250	39.753.263	41.952.474	47.439.578	57.399.423	62.187.500	59.788.807
EBIT	3.831.781	6.465.849	5.874.791	3.805.850	7.701.330	9.635.450	9.628.892
Net result	-7.805.284	616.696	1.643.412	3.079.675	7.770.200	6.373.133	5.651.481
N. employees	87	80	77	77	82	77	78

## Case Study 2

Beta S.p.A. is a public limited company operating since 1977 in the retail of distinctive sportswear and sports equipment. Its original success was due firstly to the continuous acquisition of highly prestigious distributors brands and then to the capability of innovating its products to the high-quality standards and to the strong collaborations and synergies with the main worldwide sector brands.

The Company enjoyed years of significant growth until 2012. Since then, mainly because of the decrease in consumption due to the global economic crisis, an unchanged business model even if there were an environmental evolution and some wrong strategic decisions, the Company recorded economic and financial distress; hence, in 2013, the Company presented a recovery business plan, drawn up pursuant to "insolvency code."

The management, with the help of specialized advisors, outlined a turnaround strategy, for the period 2012–2016, primarily based on competitive repositioning, organizational restructuring, financial structure's redefinition, and reduction in the costs of goods sold (COGS). To successfully work on these four main guidelines, Beta appointed a new BoD. Indeed, new managers' target of EBITDA, better days sales outstanding (DSO), days of payables outstanding (DPO), and days inventory outstanding (DIO) was achieved in the period considered. The success of the turnaround can be mainly attributed to structural and specific actions that newly engaged managers, employees, business processes, and stakeholders (e.g., banks

and suppliers) put in place to overcome the crisis. A very important role has been played by the new structural and relational capital.

For example, the new BoD promoted the optimization of the organizational structure and the revision of change in the sales mix, the cost rationalization, and the development of new commercial strategies. This mix of ventures allowed to restore the value creation and the competitive advantage to the point that, from 2020, the Company is examining the chance to go for an initial public offering (IPO).

The success of the turnaround can be seen in Table II that shows Beta's positive evolution for the period 2012–2018.

Table II. Turnover, EBIT, net results and no. of employees of Beta S.p.A. (2012-2018)

	2012	2013	2014	2015	2016	2017	2018
Turnove	344.044.000	314.526.000	310.215.000	323.213.000	339.407.000	350.876.000	379.713.000
EBITDA	2.375.000	-6.069.000	7.136.000	19.002.000	21.185.000	27.225.000	25.499.000
Net resu	-26.315.000	-17.469.000	-6.596.000	1.956.000	4.653.000	10.085.000	8.557.000
N. empl	2.200	2.086	2.062	2.147	2.283	2.391	2.585

### Case Study 3

Gamma S.p.A. is a public limited company operating since 1977 in the production and marketing of baked ham and similar products (like mortadella, raw ham, etc.). Since the 1980s, the Company has experienced exponential growth in production thanks to the great attention paid to the nutritional values and the creation of a new product suitable for the taste of an increasingly sensitive and attentive public. The removal of polyphosphates, together with the idea of the freshness-saving tray, launched Gamma on the road to success and guaranteed the high-quality level of cooked ham.

The crisis in the real economy which since 2010 has affected all sectors and caused a sharp contraction in demand, has also affected Gamma which, despite this, has managed to keep the corresponding sales volume substantially unchanged until 2012.

Since 2013, however, the Company has undergone a substantial drop in turnover which, together with the policy of strong expansion and development undertaken, has had a profound effect on Gamma's ability to meet its obligations on a regular basis.

The causes of the crisis mainly have an endogenous nature and concern excess production capacity, production inefficiencies of its main establishment, redundant organization chart, investments with lower-than-expected return rates, imposing structure of general fixed costs, interruption of supply flows in 2014 as a result of the situation of financial tension, and production inefficiencies deriving from the lack of supplies.

Due to the abovementioned reasons, in 2015 Gamma presented a recovery business plan, drawn up pursuant to "insolvency code."

The 2015–2017 recovery business plan envisaged the rationalization of the cost structure and the concentration of production and slicing activities at a single plant and the concentration of all further operational and administrative activities in a single building with a significant reduction in fixed costs and lease. All shareholdings have been placed in voluntary liquidation, the redundancy of employees has been cut off, and the increase in turnover has been monitored considering the EBITDA margin, DSO, DPO, and DIO target of the recovery business plan.

The success of the turnaround can be attributed to the new BoD that has been appointed in 2015. For example, the new BoD promoted the optimization of the organizational structure and the cost rationalization, the development of new commercial strategies, and a different approach to the market. This mix of ventures allowed restoring the value creation and the competitive advantage to the point that in 2018 the Company has been taken over by a new prestigious shareholder.

The success of the turnaround can be seen in Table III that shows Gamma's positive evolution for the period 2012–2018.

Table III. Turnover, EBIT, net results and no. of employees of Gamma S.p.A. (2012–2018)

	2012	2013	2014	2015	2016	2017	2018
Turnover	119.740.000	109.179.000	89.356.000	61.162.000	63.998.000	66.675.000	62.993.000
EBITDA	7.020.000	-26.602.000	592.000	288.000	1.380.000	5.047.000	6.781.000
Net result	281.000	-75.122.000	-23.178.000	-5.093.000	48.152.000	768.000	3.047.000
N. employee	249	232	208	161	139	139	140

#### **Case Study 4**

Delta S.p.A. is a public limited company with one hundred and sixty years of history and is among the leaders in Europe in the production of brass bars and strips in copper and its alloys, from brass to bronze and special alloys.

Serving both large industry and specialist customers, the development of increasingly high-performance copper alloy products is the daily challenge to give concrete form to a future that is more and more towards smart cities, renewable energy, and sustainable mobility.

The financial crisis of the Company appeared in 2016 due to exogenous and endogenous causes. The first ones were mainly referred to the conditions of the competitive environment (significant decrease in sales volume, increase in raw material prices, contraction in economic margins, and decrease in bank credit lines) and the second ones were mainly due to crisis of the laminate business unit, acquisition of an important shareholding, and conflict within the social structure.

In 2017, the Company presented a recovery business plan, drawn up pursuant to "insolvency code".

The industrial turnaround was based on the following:

- a) reduction in personnel costs, mainly due to the adjustment of the workforce in the context of the reorganization of the BU laminated.
- b) savings on costs related to high voltage electricity following the centralization of production activities at the main plant.
- c) savings on the costs of transporting materials between the various plants following the centralization of production activities.
- d) an expected benefit on net working capital deriving from the reduction in the average days of collection of trade receivables from "slash customers" due to the introduction, starting from 2017, of the new procedure relating to shipments and invoicing on a biweekly basis.
- e) confirmation of credit lines, on short-term lines, with partial modification of the rules of use and revision of the burden.
- f) a capital moratorium based on medium/long-term mortgage exposure.
- g) new board of directors.
- h) new management team.

The success of the turnaround can be attributed to structural and specific actions that engaged managers, employees, business processes, and stakeholders (e.g., banks and suppliers).

The new board of directors and the new management team are promoted as follows:

- a) improvement of the level of service offered to the market to recover the relationship with some important customers and increase the *Share of Wallet* on others in the portfolio.
- b) improvement in the quality level of the output (both in terms of reducing the percentage of waste and in terms of compliance) making the performance more efficient in terms of industrialization and quality control.
- c) achieving greater added value in the product output (surface coatings, packaging, shapes, and thicknesses).
- d) recovery of margins of the “laminates” business unit.

This mix of ventures allowed to restore the value creation and the competitive advantage to the point that, from 2020, the Company has a new promising industrial plan and has changed most part of the foster banks.

The success of the turnaround can be seen in Table IV that shows Delta’s positive evolution for the period 2012–2018 after the renewal of corporate governance that increased, above all, HC, and RC.

Table IV. Turnover, EBIT, net results and no. of employees of Delta S.p.A. (2012–2018)

	2012	2013	2014	2015	2016	2017	2018
Turnover	232.720.551	225.888.104	238.182.875	233.290.075	211.399.098	196.441.110	208.195.506
EBITDA	18.582.923	11.894.264	17.395.339	10.328.946	10.016.365	12.655.898	9.617.696
Net result	546.119	-2.551.259	699.486	-2.972.489	-17.644.373	683.032	5.004.823
N. employees	240	234	231	252	257	364	335

#### 4 Discussion and conclusions

The analysis shows the existence of a link between BoDs and shareholders succession and IC. Nowadays and more strongly after the emergency period due to Covid-19, one of the main concern of firms, regardless of their size and sector, is the threat of insolvency. This research intends to reveal that the incumbent manager assumes a special interest in a financial distress situation when the (new) shareholder’s structure ensures the selection of the optimal restructuring method/solution. The complexity of the decision situation in financial distress –

which includes time pressure and short terms targets – leads to increase in the risk of irrational biases in decision-making as compared to regular business situations. This is the reason why any action on the variables to bring new IC can have relevant consequences on the outcome of the successful turnaround.

The analysis of the four case studies of Italian companies seem to support the theoretical proposition that IC, when related to changes in corporate governance (Berezinets et al., 2016; Keenan and Aggestam, 2001), likely corresponds to a successful turnaround. Indeed, BoD is the main internal corporate governance mechanism that generally carries a certain amount of IC, which includes human capital (knowledge, skills, and experience) and relational capital (social ties and networks) of each individual member. As such, BoD is argued to drive the intellectual capital performance of the firm by making the various systems of IC work more effectively.

Therefore, once the review on the most relevant literature on intellectual capital and corporate turnaround is achieved, with specific attention to the Italian context, we assumed the renewal of corporate governance positively influences the turnaround outcome.

Despite the limitations and further investigations to be developed in the future, the current research seems to have taken a step forward compared to the existing literature (Berezinets et al., 2016; Demartini and Beretta, 2020; Martín-de Castro et al., 2019; Santana et al., 2017; Schiuma et al., 2008).

The analysis of the experiences from the selected four success stories presented in this article allows for a systematization of the main success elements for the solution of the crisis. In particular, we can derive an operational framework (reported in Table V) that shows the common causes of crisis, the action plan, the operational targets associated with the actions to take and a monitoring aspect that checks the achievement of said targets.

Table V. An operational framework for turnaround success

COMMON CAUSES OF CRISIS	ACTION PLAN	OPERATIONAL TARGET	ACHIEVEMENT
<b>Business Model</b>	Reschuffle of Business Model	Net Profit	Yes/No
	Cost Optimisation	Establishment cost reduction	Yes/No
	Net working capital optimisation	Positive cash flows	Yes/No

<b>Investments</b>	Outsourcing of some services	Net profit & NWC	Yes/No
	Transfer of operating area leasing	NFP Optimisation	Yes/No
	Overturning and sharing costs	Contingent asset from disposal	Yes/No
	Revision of ICT systems	Efficiency	Yes/No
<b>Management Team and staff</b>	Redefinition of the Management Team	Net Profit	Yes/No
	Staff cost reduction	Reduction of staff cost to the benchmark level	Yes/No
	Skills needs assessment	Coverage of needs skills	Yes/No
<b>Oversizing of the organisational</b>	Cost reduction (consultancy, insurance, credit services, staff charges, etc.)	Overhead cut-off and optimization	Yes/No
<b>Net Working Capital</b>	Payments to suppliers (DPO)	Reduction of WC requirements	Yes/No
	Collection from customers (DSO)	Reduction of WC requirements	Yes/No
	Optimisation of inventories (DIO)	Reduction of WC requirements	Yes/No

In terms of practical implications, our findings suggest that governing bodies may act as drivers of IC efficiency and that a change in both the shareholder's and BoD's composition has a positive impact on the success of a turnaround strategy. Indeed, the qualitative analysis allowed to demonstrate the role played by IC in the case studies. These results could be helpful for managers and practitioners in the current context where Covid-19 strongly affects companies' performances, leading to a huge number of businesses in a state of crisis.

Due to the inherent limitations of this research, further studies are necessary to refine and validate our results.

### **Abstract**

The aim of the paper is to investigate about the way the economic environment crisis, and particularly the Covid-19 emergency, affects the business valuation drivers, as well as to identify the adjustments requested to esteem a reliable value of a business, that reflects the market conditions.

Covid-19 has not only caused a health emergency, but also a real economic crisis, whose effects are destined to last for many years and whose recovery, following the most recent events, seems to take the shape of a "W". Specifically, the measures adopted to contain its propagation have seriously damaged companies all over the world, interrupting, even for a limited period, production and sales, with strong consequences in terms of lack of liquidity, worsening of financial structure and, definitely, greater risk of insolvency. However, not all companies have been affected in the same way. As with any financial crisis, the impact proves to be different depending on the industry the company operates in, as well as its characteristics.

The main research questions, therefore, are: "Are business valuation methods able to capture the impact of the crisis on companies? How is this impact reflected on corporate value? Are there sectors that have not been affected by the crisis or that have even benefited from it?".

To answer the research questions, we set a data sample of the top five companies, on a global scale, by market capitalization, with reference to two industries, air transport and telecommunications, and we observed the trend of their share prices. We found that although there is a decline for both sectors during the worst period of the pandemic (March-April 2020), over a longer time horizon (January 2019 to November 2020) these industries show opposite trends. In particular, while the telecommunications sector shows an overall positive trend, the air transport one presents a negative trend, with the latest observations being at a significantly lower level than the average level recorded over the reference period.

**Paper type** – Academic Research Paper

## 1 Introduction

The economic context has always had a deep influence on the process of business valuation, reshaping, in each step of its evolution, the concept of “economic value of capital” and the metrics to measure it. In fact, the value of a company is essentially related to three main factors: its current operations, its future prospects and its intrinsic risk (Massari, Gianfrate, Zanetti, 2016). Particularly, the risk variable, during unplanned events, should not be treated as one of the input variables, but rather as the main driver of the valuation process. In such circumstances, the DCF and multiples approaches turn out to be the most valid methods for estimating the economic value of capital, even if they must be carefully re-examined in order to incorporate the effects of the crisis (PWC, 2020).

Even though the field of business evaluation has been extensively analyzed (Guatri, Bini, 2005, Zanda, Lacchini, Onesti, 2013), a few number of studies have previously focused on the topic of valuation in the context of a crisis (Massari, Gianfrate, Zanetti, 2016). After the great recession of 2008, some researches were dedicated to the companies’ valuation in financial distress and, particularly, to the last phase of their life cycle, the decline (Damodaran, 2009). In the last twelve months the topic of the effects of the shock caused by Covid-19 on the drivers of business valuation has been analyzed, particularly in the studies conducted by consulting firms (Duff & Phelps, 2020, KPMG, 2020, PWC, 2020), even if the pandemic is currently ongoing and the level of uncertainty regarding its future developments is too high. The aforementioned studies converge in indicating that the unpredictability of the scenario must be taken into account through higher

discount rates and/or lower cash flows, for the DCF method, and lower multiples, for the multiples approach.

In order to give evidence of the different impact of the pandemic depending on the industry we tried to answer to the following research questions: are business valuation methods able to capture the impact of the crisis on companies? How is this impact reflected on corporate value? Are there sectors that have not been affected by the crisis or that have benefited from it?

We observed the performance of two sectors that have been involved in opposite ways by the crisis: the air transport sector, particularly disadvantaged due to the blocking measures and restrictions introduced worldwide, and the telecommunications sector, fundamental for the management of the emergency as it allowed the normal continuation of activities during a period characterized by social distancing. Particularly, we set a data sample of the top five companies, on a global scale, by market capitalization, with reference to the aforementioned industries and we studied the trend of daily share price during the worst period of the pandemic (March-April 2020), over a longer time horizon (January 2019 to November 2020).

## **2 The impact of COVID-19 on Business Valuation**

Between the end of 2019 and the beginning of 2020, COVID-19 has spread all over the world, turning quickly into a global pandemic causing a severe health emergency, as well as a social and economic disruption, a significant downturn in capital markets, and an increased market volatility (Van Vleet, 2020). Thus, the international economy, which had already experienced a moderate deceleration over the past two years, is going through a severe recession, due to both supply and demand shocks, that is far worse than the one experienced during the financial crisis of 2007-08, the most significant since the Great Depression (IMF, 2020).

In fact, the measures adopted to contain the propagation of the virus had a strong impact on the financial and economic performance of the companies.

The greatest impact occurred in terms of lack of liquidity: if on one hand companies have continued to incur charges and undeferrable expenses (including, among the main ones, salaries, taxes and social security contributions), on the other hand they had to deal with a strong compression of revenues, due to the interruption, even if for a limited period, of production and sales. At the

same time, the liquidity need has increased (to continue to cope with fixed costs), leading to a rapid thinning in reserves, with a consequent reduction in the ability to face demand's exogenous shock and phenomena of economic and financial instability, resulting in a realistic possibility of insolvency for many companies.

Further consequences on the balance sheet of companies are detected in terms of financial structure: the reduction in net working capital has led to greater financial requirements, which must be financed through external sources; in these scenarios, it is plausible that a certain number of companies are forced to increase their short-term liabilities, adding new debt to their financial structure.

In such an environment, where it is nearly impossible to predict the future pandemic developments, uncertainty has become remarkable, to the point of influencing the concept of economic value of a company and the metrics to measure it.

## **2.1 Critical aspects**

When referring to business valuation, economic value is estimated from going concern perspective and on the basis of future expectations, both sensitive to an economic scenario such as the one described above. As regards going concern, it has been substantially compromised by the measures adopted to contain the virus, as inactivity translates into absence of continuity. On the other hand, it has become more difficult to estimate future expectations, as in standard approaches these are estimated using historical data that, in this case, given the sudden disruption and uncertainty caused by the COVID-19 pandemic, would not reflect the current and future economic conditions in which the businesses are conducted.

Another critical aspect is the date of valuation, as it determines whether Covid-19 affects the value of a company. In fact, by doing a business valuation you can only consider what was known or knowable as of the date of the Appraisal (AICPA), implying that the impact of COVID-19 should not be considered in evaluations conducted prior to when it appeared. Most experts agree that little was known about COVID-19 as of Dec. 31, 2019, so, up to that date, this should be considered as a non-adjusting event and it didn't affect the valuation while, in March, it was widely known and should therefore be reflected in the valuation (Kaiser, 2021). However, Covid-19 could represent a triggering event whenever its effects, even if subsequent to the valuation date, have a significant impact on the

value of the company; in this case, a "roll forward" of the valuation date would be necessary.

Given these critical issues, although traditional valuation approaches remain fully usable, their mechanical application may produce business values that lack credibility and reliability (Van Vleet, 2020; Bancel, Mittoo, 2014): to grasp the nature and extent of the impact of market uncertainties, valuation methods would require reasonably supported adjustments.

## 2.2 Discounted Cash Flow

When using the discounted cash flow method, it is necessary to consider the impact of the crisis on its inputs: expected cash flows, discount rate and terminal value.

Table 1: Trend of the value as the model inputs vary.

DCF Input	Change to DCF Input	Impact on Value
Expected Cash Flows	Increase (decrease)	Increase (decrease)
Discount Rate	Increase (decrease)	Decrease (increase)
Terminal Value	Increase (decrease)	Increase (decrease)

With reference to expected cash flows, the interruption of activities and the consequent reduction of the demand for goods and services required extraordinary replanning, resulting in downward adjustments to cash flow forecasts.

Likewise, it is reasonable to assume that COVID-19 has resulted in a reduction of mid-term and long-term growth expectations, which must be reflected by a lower terminal value.

The risk of not achieving expected cash flows results in uncertain returns must therefore be captured by an appropriate risk adjustment. Considering the discount rate  $i_c$ , during market downturns, the flight to quality increases demand for safer investments such as Treasuries, which tends to bring their prices up. Lower Treasury yields, and so lower risk free rates, could lead to an overstated economic value. Thus, it may be appropriate to use a "normalized" or expected long-term Treasury yield and an upward adjustment to the risk premium rate. The weighted average cost of capital  $i_{wacc}$  was also strongly affected by the effects of

the crisis: the decline of the financial structure of companies has affected both the cost of equity and the cost of debt, leading to an increase in this discount rate.

In conclusion, all these adjustments will likely manifest themselves in lower corporate economic value, demonstrating that companies are worth less in times of increased risk and uncertainty.

### **2.3 Multiple methods**

When applying a market approach in contexts characterized by economic disruption, the main problems that arise concern the selection of the sample and the choice of the most appropriate multiple (Matschke, Brösel, 2010; Liu, 2020).

The high volatility of the company results and the different firms' reaction to the crisis, even of those belonging to the same sector, requires that the sample must be made up of companies that have experienced COVID-19 in a similar way in terms of impacts and consequences.

In this context, there are multiples whose use may be more appropriate than others. Looking at equity side multiples, a metric such as Price to Book value Ratio (P/BV) could provide more reliable estimates than Price to Earnings Ratio (P/E), which is usually preferred in "normal" times (Amendola, 2020), as the first is less related to exogenous or uncertain factors or uncertainties. Instead, with respect to entity-side multiples, it is interesting to note that some companies have experienced the use of normalized EBITDA, the EBITDAC (earnings before interest, taxes, depreciation, amortization, and Coronavirus), which eliminates the impact of the pandemic on EBITDA.

In any case, the pandemic has led to a decrease in market multiples which results, as for the DCF model, in lower economic value.

In addition to the above adjustments, for both the DCF and multiple methods, another way to make risk adjustment is to add a COVID-19 marketability discount for the current high level of uncertainty (Caruso, 2020) or, in alternative, to run different scenarios in order to consider all possible developments of the pandemic as well as the different forms of economic recovery.

## **3 Case Study: the impact of COVID-19 by industry**

Not all companies have been affected by COVID-19 in the same way. The exogenous effects on companies are heterogeneous and depend mainly on the

industry the company operates in, as well as on its specific characteristics<sup>1</sup>. For that reason, there will be some big winners and big losers as some changes will be permanent and game changing in certain industries (Signeur, 2021).

Generally speaking, as with any financial crisis, the companies most affected are those belonging to cyclical sectors, as they produce goods whose purchase can be postponed in time: the reduction in spending capacity has led to a recomposition of consumption decisions at the cost of these goods. On the contrary, companies belonging to anti-cyclical sectors, which are characterized by offering goods and services whose consumption does not depend on the economic cycle, are those least affected. Finally, in total contrast, there are those sectors capable of providing possible solutions to the pandemic, principally the pharmaceutical sector, given the primarily health-related nature of the crisis.

Graph 1: Trend of sector index by industry  
Source: Capital IQ, KPMG analysis

As shown, during the first quarter of 2020, sector index followed a general negative trend, but with some sectors more affected than others. The industries most affected by the Covid-19 crisis are travel and leisure, energy and resources

<sup>1</sup> Also the country in which the company operates is a relevant factor. However, since all countries have been affected by the crisis, this effect is not considered in order to focus on a sectoral analysis.

— mainly as a result of the lockdown measures and travel restrictions introduced worldwide, while consumer essential industries such as consumer staples, information technology and common equipment are least affected by the crisis (KPMG, 2021).

### **3.1 Methods of analysis**

In order to give evidence of the different impact of the pandemic depending on the industry, we observed the performance of two sectors that have been involved in opposite ways by the crisis: the air transport sector, particularly disadvantaged due to the blocking measures and restrictions introduced worldwide, and the telecommunications sector, fundamental for the management of the emergency as it allowed the normal continuation of activities during a period characterized by social distancing.

For each sector, we set a sample of the top five companies, on a global scale, by market capitalization<sup>1</sup> and simulated value trends observing daily share prices over a time horizon extending from early 2019 until November 2020, when the vaccination campaign had not yet been defined and the high uncertainty of the end of the pandemic made the market extremely volatile.

In fact, it is known that financial markets can hyper-react to crisis contexts by anticipating its effects (Miciula, Kadlubek, Stepień, 2020); however, it is difficult that even in these contexts, when considering a sufficiently long time horizon such as the one used, the markets are wrong in indicating the sign of the value variation undergone by the listed companies: these, more frequently, get the intensity wrong, but not the direction. For this reason, in a crisis context such as the current one, one of the references for analyzing the reasonableness of the valuation is represented by the reduction in the market share.

#### **3.1.1 The Air Transport Sector**

Over time, a particularly cyclical, as well as seasonal, trend has been observed in the air transport sector, whose performance is highly dependent on macro and microeconomic factors: any fluctuation in global economic capacity immediately affects its profits, highlighting its fragile balance and volatility. Specifically, factors such as economic growth, interest rates, exchange rates, and inflation rate have a

---

<sup>1</sup> Based on the rankings at the link <https://companiesmarketcap.com> on November 13, 2020.

great impact on the operations of companies in the industry (Wittmer and Bieger, 2011).

Thus, the severe contraction of domestic GDPs that followed the spread of COVID-19, has severely affected this sector in a negative way.

As a matter of fact, air transport is facing an unprecedented crisis (McKinsey, 2020). According to estimates by IATA (International Air Transport Association), only in March, European airports recorded a loss of 106 million passengers. For comparison, during the financial crisis of 2007-08, it took 12 months to record a loss of around 100 million passengers. It has also been reported that during the worst period, in April 2020, was recorded a decline of about 95% in air traffic compared to the same month in 2019.

*Graph 3: Daily share price trend of the sample of companies belonging to the air transport sector*

*Source: Own elaboration from Thomson Reuters data base*

Looking at the trend of daily share prices for the sample analyzed<sup>1</sup>, we can appreciate the above considerations by looking at the long decrease recorded between mid-February and early June 2020, in correspondence of the introduction of the restrictive measures, and the closure of borders by most countries.

Only towards the end of the second quarter, after many countries loosened their restrictive measures and lifted travel restrictions, air traffic has slowly recovered, but the change in passenger behavior, due to lower incomes and greater fear of potential contagion, and the arrival of the second pandemic wave

<sup>1</sup> The sample is composed of the following companies, in order of ranking: Southwest Airlines (USA), Delta Air Lines (USA), Ryanair (Ireland), Air China (China) e China Southern Airlines, (China).

with the reinstatement of containment measures, are once again sinking this sector.

In fact, the sector has not restored to pre-crisis levels of activity yet, and presents a strongly negative trend over the reference period, with the latest observations being at a significantly lower level than the average level recorded during 2019 (respectively, 21,472 US \$/day versus 27,171 US \$/day).

### 3.1.2 The Telecommunication Sector

The telecommunications sector shows an overall positive trend, due to the central role of telecommunications infrastructures and services, with reference to internet, in satisfying work, economic and social needs.

Looking at the trend of the daily share prices for the sample analyzed<sup>1</sup>, we can notice three significant trend reversals.

*Graph 2: Daily share price trend of the sample of companies belonging to the telecommunications sector*

*Source: Own elaboration from Thomson Reuters data base*

Specifically, if in 2019 values remained relatively stable, a severe contraction is observed in coincidence with the declaration of the health emergency and the adoption of the first containment measures: during the months of February and March 2020, prices reached values significantly lower than those of the previous year due to the diffused concerns that led to a wide volatility of global stock markets.

<sup>1</sup> The sample is composed of the following companies, in order of ranking: Verizon (USA), Comcast (USA), AT&T (USA), T-Mobile (USA) and China Mobile (Hong Kong).

Nevertheless, following the lower peak on March 23, a rapid growth can be observed, leading to prices much higher than in 2019 and making the inclination of the trend line positive over the whole period considered, underlining the strong economic resilience of the sector and its key role in managing the pandemic.

#### **4 Conclusions and forthcoming developments**

The aim of the paper was to investigate about the impact of the economic environment crisis, focusing on the Covid-19 emergency, on business valuation drivers, as well as to identify the adjustments to be made so that the latter is able to return a reliable value that reflects the market conditions.

Specifically, in order to give evidence of the different impact of the pandemic depending on the industry, we observed the performance of two sectors that have been involved in opposite ways by the crisis: the air transport sector, particularly disadvantaged due to the blocking measures and restrictions introduced worldwide, and the telecommunications sector, fundamental for the management of the emergency as it allowed the normal continuation of activities during a period characterized by social distancing.

In light of the empirical findings reported in the preceding paragraphs, it is possible to answer positively the research questions reported in the paper with respect to the aforementioned sectors.

We found that although there is a decline for both sectors during the worst period of the pandemic (March-April 2020), over a longer time horizon (January 2019 to November 2020) these show opposite trends. In particular, the telecommunications sector shows an overall positive trend. In contrast, air transport presents a negative trend, with the latest observations being at a significantly lower level than the average level recorded over the reference period.

In order to develop and improve the present research the following steps will be taken in the near future:

- 1) increase the number of companies constituting the sample of each sector examined in the paper;
- 2) extend the empirical analysis to sectors in which the effects of the pandemic may have been counter-intuitive or, in any case, more difficult to predict.

### Abstract

**Purpose:** This paper aims to identify and analyze the main areas on which scholars have focused in relation to crowdfunding (CF) and their contribution to the uncertain period. In particular, this review analyzes the role of this financial instrument during the Covid-19 emergency.

**Methodology:** The analysis was conducted through a systematic literature review (SLR) of 235 research contributions (articles, book chapters and books). An analysis of the content was performed to identify the main discussed topics, the main applied methodologies and the origins of contributions.

**Findings:** The findings show how the crowdfunding topic has been discussed in the literature, focusing specifically on crisis periods. The Covid-19's section, underlines the crowdfunding as a key instrument to overcome the crisis and to reach the organization's sustainability.

**Originality:** The present study contributes to the literature on alternative finance stream, confirming the positive effect of crowdfunding to overcome unforeseen periods.

**Limitations:** Limitations of the work concern the novelty of the theme and the few contributions produced. The effective contribution of crowdfunding during the coronavirus emergency could be definitively verified when the pandemic ends

Future perspectives: Future line of the work concerns the empirical studies aimed at analyzing the topics of intangible resources and organizations' sustainability in the crowdfunding and crisis context.

**Keywords** – Crisis, Financial Funds, Crowdfunding, SHSCM, Covid-19,

**Paper type** – Academic Research Paper

## 1 Introduction

Crowdfunding is a form of financing that allows organizations to obtain resources directly from the "crowd" (Modaffari et al., 2019; Paoloni et al., 2019). Crowdfunding born in the USA and, over the past few years, it has taken many forms (Dibrova, 2016). Its main 4 forms are donation-based, reward-based, lending-based, and equity-based (Cholakova and Clarysse 2015; Kuppuswamy and Bayus, 2018; Bottiglia, 2016; Ahlers, et al., 2015). However, the use of this particular instrument can also be found for funding charitable projects and recovery operations during emergencies.

In recent times, the world involved in a deep crisis due to Covid-19, a virus that imposes to implement measures to safeguard people's health. During the pandemic emergency, several organizations collaborated with the common goal of helping the community through the infrastructure and machinery needed for treatment. In this stream, several scholars highlight that, during the crises, the sustainability of organizations can be reached through appropriate technologies (ICT) and financial funds (Gold, 2017; Herlin and Pazirandeh 2012). Focusing on the financial issue, crowdfunding can act as a bridge when public entities fail to mediate promptly with adequate financial resources. Behl and Dutta, 2019 assert that crowdfunding allows mutual collaboration between citizens, firms, non-profit organizations, and government authorities. This mutual collaborative relationship across crowdfunding is recognized in the literature as sustainable humanitarian supply chain management (SHSCM) (Fawcett and Fawcett, 2013; Militello et al., 2007).

However, at the state, the issue of crowdfunding in the crisis period, as the actual one, is still unexplored.

For these reasons, this paper aims to analyze the connection between crowdfunding and the Covid-19 emergency. Particularly the main research questions are:

*RQ1. What are the main thematic areas in the scientific literature on the phenomenon of crowdfunding during the crisis period?*

*RQ2: How is crowdfunding treated in the Covid-19 theme?*

To reach the declared goals, the qualitative methodology of a structured literature review (SLR) was adopted (Paoloni et al., 2020; Paoloni and Demartini, 2016; Massaro et al., 2016).

The results show growing attention from the scholars on the topic of crowdfunding in the time of crises. Particularly the special focus provided on Covid-19 highlights that the cash flow generated from crowdfunding increases the organization's survival likelihood. Moreover, in the crowdfunding campaign during the emergency, the phenomena of social inequity (Igra et al., 2021) and gender inequality (Villaseca et al., 2020) are confirmed.

Particular attention is paid to the components of intellectual capital (structural, human, and relational) considered as key factors for the successful campaign and organizations' sustainability (Brown et al., 2019; Piva and Rossi-Lamastra, 2018; Behl and Dutta, 2019).

The present study contributes to the literature on alternative finance stream, confirming the positive effect of crowdfunding to overcome unplanned periods, as Covid-19.

Limitation of the work concerns the novelty of the theme and the few contributions produced so far. Moreover, the real effect of crowdfunding during the Covid emergency can only be definitively verified when the pandemic ends. In the future, SLR could be replicated enriching the results with new topics analyzed by scholars and, also, it is possible to conduct empirical studies aimed to analyze in detail the topic of intangible resources and organizations' sustainability.

The work is structured as follows: in sections (2) the research methodology was described; in section (3) the SLR's results were explained; section (4) is devoted to discussion and conclusion with particular attention to the Covid-19 issue; in the section (5) the implication of the work was highlighted; finally, limitations and future perspectives were outlined in section (6).

## **2 Research Methodology**

To reach the declared goal the SLR methodology (Paoloni et al. 2020; Paoloni and Demartini, 2016; Massaro et al., 2016) was adopted. This type of qualitative

literature review allows to analyze a corpus of the academic literature to develop insights, critical reflections, future research fields, and research questions.

The database used to extract the information was SCOPUS because it is widely used and the largest available database for the multidisciplinary scientific literature (de Moya-Anegón et al., 2007). The extractions were made on May 25, 2021.

As the protocol suggests, to select relevant documents related to crowdfunding in the Covid-19 era, the authors identified specific keywords. Particularly, the keywords used were "crowdfunding" and "covid-19" or "coronavirus" (to include each result that refers to the pandemic emergency). Without any other limit in the research fields, this investigation produced only 40 results. Considering this number of papers selected not relevant for applying SLR, the authors chose to widen the research field with other similar keywords according to the issue treated. The research was improved with the keywords "disaster\*" and "crisis"; the total of paper extracted is 441. After that, the contributions not related to business, management, and accounting were deleted. By the application of this filter related to the research field, the results were reduced to 235.

Considering the novelty of the topic, the authors do not apply any filters to the stage of documents. In other words, we considered also the results which have not yet reached the last stage of publication.

The final number of the results of the SLR for analysis was 235. Figure 1 shows the process used to identify the eligible research.

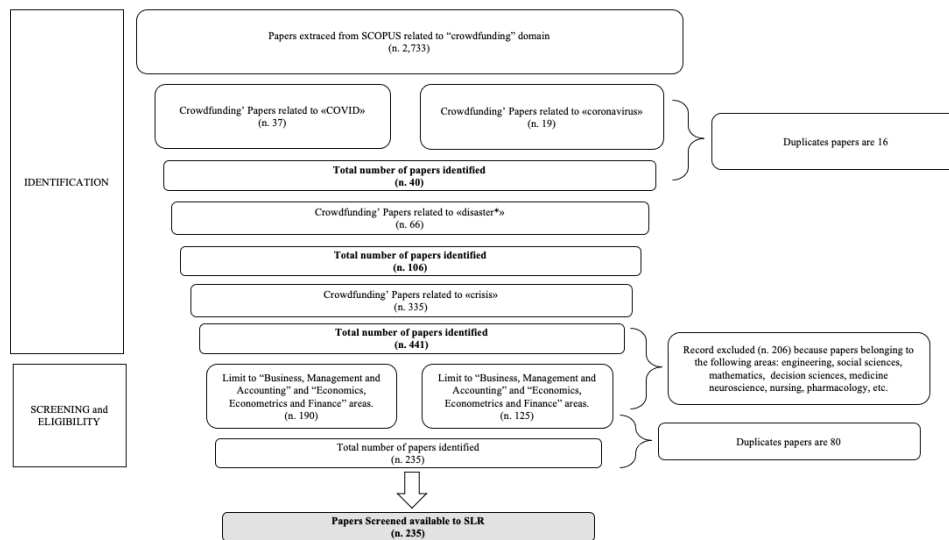

Figure 1 – Procedure to selected the contributions available to SLR

## 2.1 Definition of analytical framework

After reading titles, abstracts, and keywords of papers available to SLR, the authors define the analytical framework useful to classify and analyze all documents (Yin, 2014). According to Paoloni et al., 2020, the authors chose to carry out the papers through the following classification: article focus (A); research method (B), and geographical area (C).

Article focus (A) includes the following classes:

(A1) *Proponent and Output Campaign*: includes all those contributions dealing with crowdfunding in times of crisis, such as Covid's, focusing on the proponent (fundraiser) and aspects related to the characteristics of the campaign project. This category includes, for example, papers that focus on enterprises and organizations or those that deal with particular characteristics of the fundraising campaign output.

(A2) *Platforms*: includes all those contributions that deal with crowdfunding in times of crisis focusing on platforms and their functioning. This category includes, for example, papers that focus on the role of platforms in times of crisis and how they facilitate fundraising activities.

(A3) *Donors, Backers, Investors, and Borrowers*: includes all those contributions that deal with crowdfunding in times of crisis by focusing on the "crowd" and the

various types of actors included in it. This category includes, for example, papers that focus on the role of donors in fundraising.

(A4) *Intangible resources and sustainability*: includes all those contributions that deal with crowdfunding in times of crisis focusing on intangible assets (i.e. intellectual or social capital) and sustainability, meaning the ability of the organizations to overcome the crisis, such as that of Covid. This category includes, for example, papers that focus on intellectual capital in its three components (structural, human, and relationship) and its role in crowdfunding activities, or contributions that examine the critical success factors that ensure the sustainability of organizations and the environment through crowdfunding.

(A5) *Other*: this is a residual category that includes results of the SLR that do not belong to any of the previous categories. It includes research not related to the aim of the present paper and, for this reason, these were considered outside of the focus of the present work.

To classify the papers by research method (B) the authors identify the following classes:

- (1) *Literature analysis*: results of the SLR dedicated to the review of existing literature.
- (2) *Qualitative research*: analysis performed using case studies, experiments, content analysis, surveys through interviews, focus groups, etc.
- (3) *Quantitative analysis*: analysis carried out with statistical tools based on information obtained from databases, questionnaires, or other reports.
- (4) *Research mix*: where more than one method was applied.
- (5) *Theoretical analysis*: conceptual or discursive contributions.
- (6) *Other*: a residual category that includes research written with any method not described above.

Regarding the geographical area (C), we classified the contributions by the author's affiliation.

Following Figure 2 resume the analytical framework described above:

Figure 2 – The analytical framework

A. ARTICLE FOCUS	B. RESEARCH METHOD
A1. Proponent and Output Campaign	B1. Literature analysis
A2. Platforms	B2. Qualitative research
A3. Donors, Backers, Investors and Borrowers	B3. Quantitative research
A4. Intangible resources and sustainability	B4. Research mix
A5. Other	B5. Theoretical analysis
	B6. Other

C. GEOGRAPHICAL AREA	
East Europe	Hungary, Slovenia, Romania, Lithuania, Croatia, Serbia, Macedonia
Middle East	Israel, Lebanon, United Arab Emirates, Jordan, Saudi Arabia, Iran, Iraq, Oman, Kuwait
South and Central America	Argentine, Dominican Republic, Brazil, Jamaica, Mexico, Chile
North America	USA and Canada
Northern Europe	Austria, Belgium, Denmark, Ireland, France, Germany, Netherlands, Scandinavian countries, Switzerland, Poland, Czech Republic, Slovakia
Southern Europe	Italy, Spain, Portugal, Greece, Turkey
Asia	Russia, China, Japan, Korea, Singapore, Sri Lanka, Malaysia, Pakistan, India, Indonesia, Hong Kong, Thailand, Vietnam, Armenia, Nepal, Kazakhstan
Africa	Tanzania, Uganda, Botswana, South Africa, Nigeria, Ethiopia, Zambia, Mauritius
UK	England, Scotland, Wales, North Ireland
Oceania	Australia and New Zealand
Mixed	

Described the protocol used for the analysis, following section shows the results of the SLR.

### 3 Results

#### 3.1 Research focus

After reading the title, abstract, and keywords of each contribution, the first step of SLR was to classify the available paper for article focus. The results show that the relevant focus in which scholars wrote the main contribution is A1 "Proponent and Output Campaign" by 96 papers on 235 (41% of total). Immediately after there are A3 "Donors, Backers, Investors and Borrowers" (35 on 235, 15% of total); A4 "Intangible resources and sustainability" (34 on 235, 14% of total); A2 "Platforms" (20 on 235, 9% of total). Finally, the residual category of "A5. Other" contains 50 papers and represents 21% of the total.

The following figure 3 resumes the article focus' classification of the eligible papers.

Figure 3 – Eligible Papers per article focus (A)

<b>A- Article Focus</b>	
A1. Proponent and Output Campaign	96
A2. Platforms	20
A3. Donors, Backers, Investors and Borrowers	35
A4. Intangible resources and sustainability	34
A5. Other	50
<b>Total</b>	<b>235</b>

Considering that the topics of category "A5. Other" is not inherent to the aim of this research, they will not be considered in the following paragraphs. Therefore, the papers available for SLR are 185.

Analyzing, on the other hand, the scholars' interest in the crisis and crowdfunding, it can be seen that the first contribution was made by class A1 in 2013. The following figure 4 shows a growing interest for the scholars as the number of contributions increases each year.

Figure 4- Article Focus per year

Article Focus /Year	A1. Proponent and Output Campaign	A2. Platforms	A3. Donors, Backers, Investors and Borrowers	A4. Intangible resources and sustainability	TOTAL
2012	0	0	0	0	0
2013	2	0	0	0	2
2014	4	0	0	1	5
2015	7	0	1	3	11
2016	12	1	3	3	19
2017	8	0	5	2	15
2018	18	6	3	6	33
2019	18	9	7	4	38
2020	21	2	8	7	38
2021	6	2	8	8	24
<b>TOTAL</b>	<b>96</b>	<b>20</b>	<b>35</b>	<b>34</b>	<b>185</b>

### 3.2 Research method

Quantitative research (B3) is the most common research method utilized by scholar to analyze the topic of crowdfunding in the crisis context. With 87 papers on 185, it represents 47% of total. After this, the most common method that scholars prefer is qualitative research (B2) with 53 papers (29% of total), follow the research mix method with 25 contributions (14% of total); theoretical analysis with 11 papers (6% of total), literature review method with 7 papers (4% of total) and other method, not included in the above categories, with 2 papers (1% of total).

Following figure 5 resume the above results.

Figure 5- Eligible Papers per Methodology (B)

<b>B - Methodology</b>	
B1. Literature analysis	7
B2. Qualitative research	53
B3. Quantitative research	87
B4. Research mix	25
B5. Theoretical analysis	11
B6. Other	2
<b>Total</b>	<b>185</b>

Analysing the different methodology with the article focus mentioned in the above section (3.1), emerges that the quantitative research is the methodology preferred by scholar to develop the topic of article focus A1, A2 and A3. Only to develop the paper related to intangible resources and sustainability (A4), scholars make more use of qualitative analysis.

Following figure 6 shows the link between article focus and methodologies utilized by scholars.

Figure 6- Link between Article focus and Methodology

<b>(A) Article Focus</b>	<b>(B) Methodology</b>	<b>Total</b>
<b>A1. Proponent and Output Campaign</b>	B1. Literature analysis	5

	B2. Qualitative research	20

	B3. Quantitative research	<b>12</b>
	B4. Research mix	<b>7</b>
	B5. Theoretical analysis	<b>4</b>
	B6. Other	<b>4</b>
	<b>TOTAL A5</b>	<b>50</b>

### 3.3 Geographical area of author's affiliations

Most of the documents analyzed were written by authors with affiliations from (C5) Northern European (39 papers, 21% of total) follow (C6) Northern Europe and (C11) Mixed area with an equal number of contributions (31 papers, 17% of total for each area). The peculiarity that emerges from this analysis is that it does not record any contribution on the subject by scholars from the C3 South and Central America area.

Following figure 7 resume the above results.

Figure 7- Eligible Papers per Geographical Area (C)

<b>C - Geographical Area</b>	
C1. East Europe	5
C2. Middle East	2
C3. South and Central America	0

### **3.4 The most cited research**

To understand the different relevant topics identified (Ardito et al., 2015), the most cited research was considered. To do this, the authors considered the average value of citations. Using average (18.25 citations), the papers to be analyzed are 31, excluding those belonging to the A5 "Other" category.

The results show that most quoted papers belong to class A1 "Proponent and Output Campaign" of article focus (31 contributions).

Many of these refer to the entrepreneurial sphere and companies approaching the world of crowdfunding (Brown et al., 2018; Block et al., 2018; Cumming and Vismara, 2017; Bruton et al., 2015). The most recurrent themes concern the contribution that crowdfunding can give to companies to overcome moments of crisis (Vulkan et al., 2016; Moritz and Block, 2016; Lehner and Nicholls, 2014); the value of communication and information in the project for which the fundraising campaign is being launched (Anglin et al., 2018; Parhankangas and Renko, 2017; Lehner, 2013); the different strategies to be adopted in the crowdfunding campaign (Martínez-Climent et al., 2018; Kraus et al., 2016; Tomczak et al., 2013).

Follow the class of article focus A3 "Donors, Backers, Investors and Borrowers" with 6 contributions, the most recurrent themes analyzed by scholars regard the crowd's behavior (Cumming et al., 2019; Shneor and Munim, 2019; Stanko et al., 2017) and the relevance of information in their decisions (Polzin et al., 2018; Kang, et al., 2016; Morse, 2015).

Focusing on the class of article focus A4 "Intangible resources and sustainability" (5 contributions), the most recurrent themes analyzed by scholars regard the role of social capital in crowdfunding operations (Brown et al., 2019; Piva and Rossi-Lamastra, 2018; Lehner, 2014); the relationship between shareholder structures and firm performance (Walthoff-Borm, 2018b); and the importance of knowledge management capabilities for successful open innovation in crowdfunding for agri-food businesses (Cillo et al., 2019).

Finally, the most recurrent topics analyzed in the class A2 "Platforms" (with only 2 contributions) regard the factors that affect their creation in the European countries (Dushnitsky et al., 2016); and the analysis of its contribution concerning firm's performance (Walthoff-Borm et al., 2018a).

Regarding the research method (B), the most cited research studies mainly used B3. Quantitative research (17 contributions). Many authors have also used B2 Qualitative research (8 contributions), while few have opted for B4 research

mix (3 contributions). Little attention has been paid by scholars to the B1 literature analysis (2 contributions). Other method B6 was used only for 1 contribution. No research fell into the B5. Theoretical analysis.

Regarding on geographical area (C), the most cited research was written by authors with affiliations in C5. Northern Europe (10 contributions). Many authors came from C4. North America, C6. Southern Europe; C9. UK and C.11 Mixed with 5 contributions for each class. From C7. Asia there is only 1 contribution.

#### **4 Discussion and conclusion**

This section is devoted to exploring relevant topics about each class. To address RQ1. (*What are the main thematic areas in the scientific literature on the phenomenon of crowdfunding during the crisis period?*) the following contributions are presented.

The most recurrent research of class A1. "Proponent and Output Campaign" regards crowdfunding as a new instrument to overcome the crisis in the entrepreneurial landscape, the quality of information and communications to attract new funds, and the effect of this innovative financial tool to increase the firm's performance. The contributions of class A2 "Platform" underline that during the uncertain periods, the possibility of raising money from the crowd appears as a "magical cash machine" (Dushnitsky et al., 2016), becoming the "last resort" for the company during the crises (Walthoff-Borm et al., 2018a).

Regarding the class dedicated to the "crowd" (A3. Donors, Backers, Investors, and Borrowers), the main topic that scholars investigate is crowd behavior and the choices made during fundraising activities (Cumming et al., 2019; Shneor and Munim, 2019). In particular, the problem of information asymmetry and the role of communication and information during the campaign were analyzed (Stanko et al., 2017; Polzin et al., 2018). Good information and communications increase the backer's trust degree during the crisis period (Kang, et al., 2016). In this way, a lot of relevance assumes the contributions placed in class A4 "Intangible resources and sustainability". Moving the discussion on the trust, Brown et al., 2019 confirm that one of the main factors that allows the company to raise funds is relational capital, a component of intellectual capital. Particularly, the relationship established by the company with investors during the campaign increase the success likelihood to reach the financial goal. Also, Piva and Rossi-Lamastra, 2018, investigate the signal that attracts the investors during the

campaign. The study highlights a positive role of human capital that is expressed through other information not present in those in the campaign. For instance, promoter information present on social media plays a positive role in fundraising. Focusing on the sustainability topics, the positive role of crowdfunding during the crisis period is confirmed by Kim and Hall, 2021. The study, through a structured model, shows a positive relationship between the risk perception and the desire for participating in crowdfunding for sustainability. The authors assert that perceived risk negatively and significantly leads to crowdfunders' intention to fund sustainability projects.

Before analyzing direct contributions on crowdfunding and covid-19, it is useful to introduce the contribution of Baltas et al.,2021 who studies alternative financing tools, such as crowdfunding, during natural disasters. The authors demonstrate that, within 3 months of the disaster event, the amount of raised funds through alternative financing instruments increases. In this way Behl and Dutta, 2019 fits in, confirming that crowdfunding, combined with corporate social responsibility (CSR), allows the organization to overcome the crisis. According to the authors, crowdfunding acts faster than public entities, connecting citizens, firms, and NGOs. Fundraising implemented through CSR enables the realization of the phenomenon of sustainable humanitarian supply chain management (SHSCM), one of the main collaboration factors in overcoming the crisis and recovery.

#### **4.1 Crowdfunding in the Covid-19 era**

This section is dedicated to in-depth analysis of the issues scholars link between crowdfunding and covid-19. Due to the current nature of the topic, the average citation value could not be considered but the authors selected specific papers on the topic of coronavirus. In this way, the contents of this section are dedicated to answering RQ2: *How is crowdfunding treated in the Covid-19 theme?*

Igra et al.,2021 observe the phenomenon of crowdfunding during the covid emergency through an analysis of charitable campaigns promoted by the GoFundMe platform. The analysis of 175,000 campaigns shows how crowdfunding leads to social inequities during the emergency. Indeed, crowdfunding provides substantially higher benefits in wealthier counties with higher levels of education. People from these areas are more likely to initiate campaigns in response to the adverse health and economic impacts of COVID-19.

Farhoud et al., 2021 introduce the topic of social enterprises in crisis management from Covid-19. According to the authors, the cash flow generated by these enterprises through crowdfunding increases the likelihood of survival of the organizations. Chandler et al., 2021 offer a reflection on three typical moments of the post-crisis phase, identifying them as business resumption, crisis impact analysis, and future evaluation and modification. The authors describe the Covid-19 era as an exogenous shock and therefore draw a post-crisis recovery perspective based on the three moments described above. The recovery starts with the "business resumption" phase according to which entrepreneurs resort to crowdfunding to provide financial relief for their businesses. To realize this first phase, entrepreneurs need to leverage two main concepts: i) consider crowdfunding as a mechanism for continued venture operations, in addition, to a source of new venture funding; ii) explore the merits of crowdfunding as a medium for facilitating founder exit strategies. The second phase "crisis impact analysis" concerns the vehicle through which becomes possible to activate the fundraising activity, i.e. the platforms. According to the authors, in this phase, it is important to carefully observe the platforms available to activate the collection. Frequently moments of crisis, such as the one of Covid-19, encourage fraudulent behaviors and for this reason, it is important to take care of the quality of information to discourage these behaviors and increase the efficiency of the market. The third step "future evaluation and modification" concerns the assumption that once post-crisis survival is achieved, entrepreneurs should not abandon the idea of continuing to use the crowdfunding tool to finance new initiatives. Trusting platforms might open up new opportunities for funding in the future.

Villaseca et al., 2020 provide a gender perspective of crowdfunding during the Covid-19 era. The authors focusing on the financial capacity of start-ups, revealing a potential gender bias both on the supply and the demand side of financing. In this stream, the study confirms previous empirical evidence even in the Covid-19 era, according to which the entrepreneur obtains capital from people rather close to her, like parents or friends.

Finally, the two last contributions on the topic of crowdfunding during coronavirus focusing on the food and agricultural context. Especially, Yu and Khan. 2021, through a game analysis, propose a financing system for green agricultural product supply chain (GAPSC) with agricultural product suppliers as financiers and citizens as investors. proposed However, due to the low cost of

capital, a crowdfunding instrument was preferred. Zhao et al.,2020 investigate the factors that affect a donation-based crowdfunding campaign for coronavirus relief of food donation, analyzing which factors determine the campaign's success. The authors identify the presence of picture and video, an attainable target fund, the presence of project updates, the feedback and the possibility of comments between fundraiser and backers, the presence of external links to the website as factors that have a significant influence on the crowdfunding campaign success.

## **5 Implications**

The present study reveals several theoretical and practical implications. First of all, the work contributes to the literature on alternative finance tools, confirming the positive effect of crowdfunding to overcome uncertain periods, as Covid-19. This research brings to light the contribution of additional factors that fit between crowdfunding and the crisis' issue. Particularly, these refer to the components of intellectual capital, such as structural, human, and relational capital. Several studies confirm their contribution to the achievement of sustainability and recovery of organizations affected by the crisis. Referring to practical implications, this study can provide the base of knowledge to efficiently approach unplanned events. Indeed, several elements, such as CSR and SHSCM, have been identified as success factors.

## **6 Limitations and future perspectives**

The limitations of the present work refer to the novelty of the topic discussed. The still ongoing coronavirus pandemic does not allow for comprehensive knowledge on the issues. In this way, the future lines of research concern empirical studies aimed to know in detail what are the success factors of organizations to overcome the pandemic. With this purpose, this research work will continue with multiple case studies on the topic of intangible resources and organizations' sustainability.

### Abstract
